The notification in "Gazette" of June 27th concerning Capt. G. A. Revington is cancelled.

ADMINISTRATIVE BRANCH.—Flt. Lt. L. M. Boddam-Whetham to be Flt. Lt., from (S.O.), Aug. 12th (substituted for notification in the "Gazette" of Aug. 29th).

Flying Officer (actg. Flt. Lt.) H. B. Dakin relinquishes the actg rank of Flt. Lt. on ceasing to be empld. as Flt. Lt., Oct. 4th.

Capt. L. M. Boddam-Whetham relinquishes his commn. on ceasing to be empld., from (S.O.), Aug. 28th (substituted for notification in the "Gazette" of Oct. 21st, wherein this officer was shown under Flying Branch).

Transferred to the unempld. list:—Sec. Lt. W. K. Jenne, March 13th; Sec. Lt. H. S. Harris, Aug. 31st; Lt. A. Rowbottom, Sept. 4th; Lt. E. W. Pringle, Lt. J. M. Russell, Sept. 6th; Lt. J. Edwards, Sec. Lt. R. C. Ryan, Sept. 9th; Sec. Lt. J. Ross, Sept. 11th; Sec. Lt. C. G. B. Edwards, Sept. 12th; Lt. H. V. Hall, Sept. 27th (substituted for notification in the "Gazette" of Oct. 21st); Lt. J. E. Morgan, Oct. 11th; Sec. Lt. L. A. T. Power, Lt. J. G. C. Williams, Oct. 12th; Maj. A. C. E. S. Bowlby, Oct. 14th; Sec. Lt. W. F. M. Hopkins, Capt. A. S. Weeding, Oct. 15th; Sec. Lt. W. J. Wreford, Oct. 21st; Sec. Lt. F. G. Clarkson, Oct. 25th; Sec. Lt. P. Coogan, Oct. 26th; Sec. Lt. P. T. Rule, Lt. A. C. W. Williams, Oct. 27th; Lt. R. B. Collins, Lt. W. H. Crotty, Oct. 29th; Capt. (Hon. Maj.) A. F. Morris, Oct. 30th; Maj. T. G. Leith, O.B.E., Nov. 1st; Sec. Lt. E. J. Gordon, Nov. 2nd; Lt. H. C. E. C. P. Dalrymple, Nov. 4th.

Maj. A. Brind relinquishes his commn. on account of ill-health contracted on active service, and is permitted to retain his rank, Nov. 6th.

Lt. A. L. Hitt (Lt., D. of Cornwall's Lt. Infy.) resigns his commn., Nov. 15th.

The notification in the "Gazette" of Aug. 22nd concerning Lt. J. Edwards is cancelled.

TECHNICAL BRANCH.—Sec. Lts. to be Lts.:—W. C. Francis, May 30th; C. S. Goode, July 7th (substituted for notification in "Gazette" of Oct. 14th); G. C. Walsh, July 14th.

Sec. Lt. (Hon. Capt.) W. E. Humphreys to be Lt., April 2nd, 1918, without pay and allowances of that rank prior to Sept. 17th, 1918.

Sec. Lt. A. N. Goodwin to be Lt., without the pay and allowances of that rank, Jan. 19th.

Pilot Officer T. G. Brice to be Flying Officer without the pay and allowances of that rank, Oct. 1st.

W. J. Collins (late Deputy Commissary and Hon. Capt., Indian Army) is granted a temp. commn. as Sec. Lt. (Grade A.), without pay and allowances, April 1st, 1918, and to be Hon. Capt.

Pilot Officer E. C. Farma to be Pilot Officer (Grade B) from (Ad.), Oct. 18th.

Transferred to the unempld. list:—Lt. H. B. Richards, March 6th; Capt. A. M. Lester, April 15th; Lt. F. S. Barton, May 5th; Lt. C. C. Hicks, June 30th; Sec. Lt. H. G. Dixon, July 26th (substituted for notification in "Gazette" of Aug. 19th); Sec. Lt. S. Pollard, Sec. Lt. F. W. Pridham, Sept. 2nd; Sec. Lt. R. S. Porter, Sept. 8th; Sec. Lt. (Hon. Lt.) W. H. Pullen, Sept. 9th; Lt. R. Roots, Lt. S. M. Rowlands, Sept. 11th; Lt. W. H. Rose, Sept. 13th; Lt. H. E. Randall, Sept. 18th; Capt. F. B. Pulham, O.B.E., Sept. 19th; Maj. A. Robertson, Sept. 21st; Capt. O. I. Preston, M.C., Sec. Lt. J. C. E. Price, Sept. 23rd; Maj. J. S. Nicholson, M.B.E., Oct. 9th; Lt. J. McKeown, Oct. 10th; Lt. H. G. Bell, Oct. 13th; Sec. Lt. T. F. Emms, Oct. 17th; Sec. Lt. (Hon. Lt.) J. G. Dyson, Oct. 18th; Lt. (Hon. Capt.) J. F. Bargman, Lt. D. R. Morford, Lt. M. V. Morgan, Oct. 28th; Capt. R. F. Bellamy, Oct. 29th; Sec. Lt. R. Locke, Oct. 30th; Lt. R. J. Costigan, Oct. 31st; Maj. H. G. Atkinson, O.B.E., Nov. 1st; Lt. W. J. Aubert, Nov. 3rd; Sec. Lt. (Hon. Lt.) N. Whitley, Nov. 5th; Sec. Lt. E. W. Reynolds, Nov. 6th.

Capt. A. Belton, O.B.E. (R. Fus.), relinquishes his commn. on account of ill-health contracted on active service, and is granted rank of Maj., Nov. 4th.

Capt. C. Gordon Riley relinquishes his commn. on account of ill-health caused by wounds, and is permitted to retain his rank, Nov. 7th.

Lt. S. C. Tucker relinquishes his commn. on account of ill-health, and is permitted to retain his rank, Oct. 18th.

The rank of Lt. H. A. Chapman is as now described, and not Sec. Lt. as stated in "Gazette" of March 28th.

The notification in "Gazette" of Sept. 5th concerning Lt. E. A. Baker, M.C., is cancelled.

MEDICAL BRANCH.—Flt. Lt. G. Cranstoun to be actg. Sqdn. Ldr. whilst empld. as Sqdn. Ldr., Sept. 4th

Flying Officers to be Flight Lts.:—S. A. Clark, Sept. 25th; S. R. E. Davies, J. Gorsky, V. I. Levy, K. F. D. Waters, Nov. 1st.

Transferred to empld. list:—Capt. N. Rumboll, Oct. 23rd; Capt. H. C. Cox, Nov. 1st.

Capt. Q. Moir Gray relinquishes his commn. on account of ill-health, and is permitted to retain his rank, Aug. 26th.

DENTAL BRANCH.—Flying Officer F. B. Stradling to be Flt. Lt., Oct. 30th.

CHAPLAINS BRANCH.—The Rev. G. D. Jones, B.A., is transferred to unempld. list, Oct. 21st.

MEMORANDA.—The following Probationary Flight Officers are granted hon. commns. as Sec. Lts.:—F. H. Dawson, L. J. Empson, Nov. 22nd, 1918; R. P. France, Dec. 1918; F. W. Ings, Jan. 16th; D. E. Huck, Feb. 21st; J. S. Mackinnon, March 9th; A. E. Blaxill, W. N. Errington, April 15th; O. Drew, April 30th; J. W. Maidment, June 26th.

Lt. B. D. Bellamy (Essex R.) relinquishes his commn. on ceasing to be empld., Oct. 31st.

Transferred to unempld. list:—Capt. G. W. Robarts, M.C., from (S.O.),

Sept. 18th; Capt. R. F. Maitland, O.B.E., from (S.O.), Oct. 6th; Lt. (Hon. Capt.) F. C. Clements, from (S.O.); Maj. O. H. Powell, from (S.O.), Oct. 31st; Lt. C. S. Fulton, from (S.O.), Nov. 1st.

The notifications appearing in "Gazettes" of dates indicated below appointing the following Officers to short service commns. are cancelled:—Flt. Lt. L. P. Ferris-Scott (Ad.); Flt. Lt. N. Keeble, D.S.C. (A.); Flying Officer F. G. Brookman (T.); Flying Officer H. H. Sharp (T.), Sept. 12th; Flt. Lt. L. O. Brown, D.S.C., A.F.C. (A. and S.); Flt. Lt. D. O. Mulholland, A.F.C. (A.); Flt. Lt. P. D. Robertson, A.M. (T.); Flying Officer C. Rapley (T.), Sept. 16th; Flt. Lt. P. E. L. Gethin, A.F.C. (A.); Flying Officer H. L. Rough, D.F.C. (A.), Oct. 10th; Flying Officer S. Dawson, D.F.C. (A.); Flying Officer L. G. Morris (T.), Oct. 24th.

The Christian names of Sqdn. Ldr. John Claude Malcome Lowe (A.P. (T.)) are as now described, and not "John Cecil Mansfield," as stated in "Gazette" of Nov. 11th, appointing this officer to a short service commission

PERSONAL NOTICES.

MILITARY.

ENGAGEMENTS.

BECK—DUGDALE.—The marriage arranged between Capt. Edwyn Tyrrell Beck, D.S.O., M.C., Royal Fusiliers, attd. R.A.F., and Miss Mollie Dugdale, will take place on Wednesday, Dec. 17th, at St. Mark's, North Audley Street.

CREWDSON—FYERS.—A marriage has been arranged between Major Eric Crewdson, M.C. (late R.E. and R.A.F.), younger son of Mr. and Mrs. Francis William Crewdson, of Gilling Grove, Kendal, Westmorland, and Mary Stuart, only child of Major Evan W. H. Fyers (Reserve of Officers), Wellington Club, S.W., and granddaughter of the late Lieut.-General Sir William Augustus Fyers, K.C.B.

RAVENSCROFT—JENKS.—The engagement is announced between Capt. S. Trevor Ravenscroft (late Lancashire Hussars and R.A.F.), third son of Mr. and Mrs. S. Ravenscroft, of Broughton Grange, Cartmel, Lancashire, and Brathay, Oxton, Cheshire, and Marjorie, youngest daughter of the late Mr. Henry Jenks, of Barrow Hedges, Carshalton, Surrey, and Mrs. Jenks, Dunairds, Birnam, Perthshire.

AIR FORCE.

ENGAGEMENTS.

FIELD—ELLIOTT.—The engagement is announced between James Roy Field, late R.A.F., younger son of Mr. W. F. and Mrs. Field, of The Highlands, Enfield, and Joyce Clèlie, only daughter of Dr. and Mrs. A. Campbell Elliott, of Cranford, St. Annes-on-Sea.

HAMILTON—MITCHELL.—The marriage of Lieut. Wallace Ferrier Hamilton, R.A.F., youngest son of Mr. and Mrs. Claude Hamilton, of Macedon, Victoria, Australia, and Elsie, daughter of Mr. and Mrs. Ernest Mitchell, of 5, Park Street, Bath (formerly of Folkestone), will take place at St. Andrew's Church, Bath, on Dec. 2nd, at 2.30. No reception. Friends will be welcome at the Church.

SOUTHALL—CAMPIN-TOMPKINS.—The engagement is announced between Mr. A. W. Southall, R.A.F., son of Mr. W. Southall and Mrs. Southall, of Retford, and Marjorie Mary, daughter of the late Mr. W. Tompkins and Mrs. Tompkins, of Bicester.

SYMONS—LE BRASSEUR.—A marriage has been arranged, and will take place early in December, between Stephen White Symons, late R.A.F., son of the late William Christian Symons and Mrs. Symons, of 129, Beaufort Street, Chelsea, and Margaret Le Brasseur, eldest daughter of Mr. and Mrs. Robert Le Brasseur, of Sunnycote, Rosslyn Hill, Hampstead.

ON SIX MONTHS OF CIVIL AVIATION—I.

One day last week His Majesty's Stationery Office issued a White Paper entitled "Synopsis of Progress of Work in the Department of Civil Aviation, May 1st, 1919, to October 31st, 1919." As the first document of its kind dealing with Civil Aerial Transport it deserves to be considered in detail by all concerned with aeronautics, therefore it is reproduced hereafter, and such comments as seem necessary are appended to each section.

The impression left on one's mind after reading it is that Commercial Aeronautics have a far greater future than most people believe to-day, for if such progress is possible in so short a time despite the hindrances of Government control it is evident that as commercial flying expands and shakes itself free from the leading strings of the Air Ministry it will develop more and more rapidly and will become established on a firmer basis.

Except in the sphere of International Politics it is impossible to see how the Department of Civil Aviation has helped civil aviation. On the other hand there are many ways in which the Department has been a hindrance. But there are times in the youth of all growing things when a certain amount of suppression is advisable and makes for the better development of the adult. For example young plants have to be thinned and pruned, small boys are the better for the discipline of even the stupidest of schoolmasters, and the female figure is improved by the apparent restriction of a corset in its youthful stages.

The Department of Civil Aviation must be regarded somewhat in such a light. Though it is no help to the Aircraft Industry, the mere fact of its existence irritates the Industry into some activity. But, so far as this "Synopsis" is concerned, one is certainly inclined to jib a bit when the Department takes credit for progress which has been made in spite of its operations and not because of them.

However, let us to the Synopsis. Here followeth the first section :—

I.—INTRODUCTION.

Except for a brief period during Easter week this year, civil flying did not open officially until May 1st, 1919, and the six months which have since elapsed forms perhaps a convenient period on which to make a preliminary review of the work done by, and to estimate the future of, the Department of Civil Aviation.

Between February 12th—on which date it was announced in the House of Commons that the Government had decided to set up a Department of Civil Aviation—and May 1st, the official date of the opening of civil flying, a small staff began to attack the multiplicity of problems and difficulties attending the transition period from war to peace, which had to be met in the commencement of civil aviation. There were the adjustment and redistribution of activities between the Service and civil sides; the framing, with the assistance of representatives from the industry and other experts, of the Air Navigation Regulations for the control of civil flying at home, as distinct from the International Air Convention, governing the regulations for international flying; the necessity for deciding upon which routes traffic was most likely to follow and develop, and the aerodromes which should therefore be retained in the general after-war liquidation.

There were also a number of other problems of a kindred nature to assist in the solution of which there were no landmarks, no established precedents and no accumulated experience.

II.—PROGRESS

(*a*) RELATIONS WITH FOREIGN COUNTRIES.—The International Air Convention, which was in the main based on the Air Navigation Regulations drawn up for the control of civil flying at home, was signed on October 14th by 11 out of the 13 nations which were parties to it, the United States and Japan not yet being in a position to sign.

The terms of this Convention were made public some months ago, but it was considered desirable to anticipate its becoming operative by provisionally opening traffic by air with certain foreign countries, as it was thought that aerial transport firms could not too soon gain experience of running regular international services, both for the benefit of the industry, and the early development of the air routes of the Empire on a commercial scale.

Great pains were therefore taken to make temporary agreements with other countries, and such were concluded with Belgium, France, Holland, Italy, and Portugal, while permission for individual flights was obtained from Denmark, Norway, Spain, and Switzerland; and steps have since been taken which it is hoped will ensure the subscription of Holland, Spain, and Switzerland to the International Convention at no distant date, and later of the Scandinavian countries, so that one code of rules for the air will obtain throughout the whole of Europe.

The conclusion of these provisional agreements has enabled British aircraft belonging to commercial firms to visit Amsterdam, Brussels, Christiania, Copenhagen, Lausanne, Madrid, Paris, and Stockholm, whilst a demonstration flight for civil purposes carried out by R.A.F. aircraft was made as far as Helsingfors.

Every effort has been made to assist British firms to establish regular services between London and Paris, London and Brussels, and London and Amsterdam.

So far there is little call for comment. One would only remark that Switzerland seems little inclined to listen to the voice of the charmer from the Civil Aviation Department. Apparently Switzerland regards joy-riding as a branch of hotel-keeping and therefore a national prerogative, judging by the obstacles put in the way of British and other foreign aviators who have desired to show the Swiss how it ought to be done.

Of the "demonstration flight for civil purposes carried out by R.A.F. aircraft . . . as far as Helsingfors" perhaps the less said by the Department the better. One has already shown that there was no "demonstration" at Stockholm, and nothing has been heard of any at Helsingfors. Copenhagen and Christiania, which are not good markets, seem to have had all the fun to themselves.

Very wisely the compilers of the synopsis refrain from mentioning the fact that a Gosport flying-boat which was permitted to fly to Amsterdam was expressly prohibited from flying after it got there. So it seems that the "Progress of Work" rather cancels itself out when one considers the plus and minus sides of it.

CONCERNING AIR ROUTES.

The Synopsis continues :—

(*b*) RECONNAISSANCE.—Considerable progress has been made

with the reconnaissance and development of Imperial air routes.

The Cairo-Karachi route has been opened for military purposes, and will be available for civil traffic at an early date. That from Cairo to the Cape has been surveyed, and a chain of landing places established. Of the latter the section lying in the Union of South Africa should shortly be available for the use of civil enterprise, and the whole route should be capable of being flown on an experimental basis before the end of the year. A full reconnaissance of the route from India to Australia has also been completed.

It will be noticed that the compilers of the Synopsis have wisely omitted any reference to "blazing the trail," a phrase which was until recently popular among speech-makers from the Department of Civil Aviation.

It is rather a pity that more has not been said about the Cairo-Karachi route and that from India to Australia. Perhaps General Swinton's excellent department will shortly issue a contour map of the line, showing and describing the landing places. It is, however, of interest to note that the first civilian flight over part of the route is that of the amazing Monsieur Poulet, who, with his ancient tail-boom Caudron and his two old 80 h.p. Le Rhône engines, has successfully taken the shine off all our Australian competitors for the £10,000 prize, thanks to the combined efforts of the Department of Civil Aviation and the Committee of the Royal Aero Club, which prevented anybody from starting while the weather was good and the days were long.

The Cape to Cairo route is also of interest, and more information as to landing places would be gratefully received. But it seems quite likely that for some years to come the best way to getting to the Cape by air will be by seaplane down the Red Sea, or even down the West Coast. There is an opportunity here for an adventurous seaplane pilot to be the first to reach the Cape by air.

Fragile Regulations.

We now come to a far more immediately interesting section of the Synopsis :—

(*c*) Air Navigation Regulations.—The Air Navigation Regulations which came into force on May 1st, 1919, were based on war experience and on an estimate of the requirements of civil aviation. In a few directions experience has shown that there are omissions, while in others the Regulations have been found to be somewhat in advance of requirements and their strict enforcement up to the present has proved undesirable. It has not always been easy to administer the Regulations so as to secure the safety of the public without handicapping the expansion of air work, but frequent consultations between the department and representatives of the industry and the goodwill of all concerned have enabled a very fair measure of success to be obtained in this respect. Any defects in the Regulations or in the method of administering them brought to light by experience are corrected as rapidly as possible

One is glad to notice that in some respects "the Regulations have been found to be somewhat in advance of requirements, and their strict enforcement up to the present has proved undesirable." This disposes of a prevalent idea that some of the Regulations are so silly that if the Department enforced them it would merely make itself look more ridiculous than it is in reality. It also accounts for the fact that unregistered pilots fly machines without airworthiness certificates over prohibited areas with absolute impunity. It also accounts for the casual way in which people wander into and out of the country by air without troubling official people about their doings.

But it does not account for airworthiness certificates being given to machines which are not airworthy, nor for the refusal of airworthiness certificates to machines which are airworthy. Nor does it account for the refusal of permits for the carrying of passengers to pilots of unblemished record and long experience and the granting of permits to notoriously incompetent or reckless pilots.

A Bad Case of Officialism.

One has in mind the case of a pilot who owned a machine before the war and carried passengers without let or hindrance. During the war he was a test pilot and put many dozens of machines of all types through their tests for private firms and for the Air Council. He also carried a great number of passengers during these tests. In five years' flying he never had an accident owing to any fault of his own, and his only crashes have been two or three quite trivial affairs caused by defective machines.

Yet when he applied for a licence to carry passengers "for fee or reward" he was refused because of defective eyesight. It is true that he wears glasses, but such is his carefulness that he always carries a spare pair of glasses in his pocket when flying in case the pair he is wearing are damaged or knocked off, the said glasses being built into proper flying-goggles.

There is a clause in the Regulations which says that physical disabilities such as will disqualify a new pilot are not to apply to pilots who have flown before a certain date. This clause and his splendid record as a pilot should be enough to qualify the pilot in question for his passenger-carrying certificate, and yet he has been turned down by the doctors because *they*, forsooth, are not satisfied with him.

Thus he is prevented from earning his living at a profession in which he is a past master, and the progress of civil aviation is deprived of the help of a very valuable man. It would be of great interest to know what the doctors who turned him down know about practical flying and how much of it they have done themselves.

It would appear from this case that not only may it be "undesirable" to enforce the Regulations against people who choose to ignore them, but that the officials of the Air Ministry may themselves ignore with impunity such few Regulations as exist for the benefit of aviators instead of for their suppression.

(To be continued.)

THE DEATH OF M. DEUTSCH DE LA MEURTHE.

One regrets to announce the death in Paris, on Nov. 24th, of M. Deutsch de la Meurthe, President of the Aero Club de France. He revived by his actions memories of the splendid days of the Medicis, when a discriminating patronage developed the arts and the sciences to a degree such as was not possible in many decades of normal progress. The science of aeronautics and the art of music owe his memory a heavy debt of gratitude for the generous benefactions by which he materially assisted in their development.

Time is lacking in which adequately to deal with his career in this issue of The Aeroplane. His biography will therefore appear in this paper next week.

THE PARLIAMENTARY AIR COMMITTEE.

On Nov. 18th Major-Gen. J. E. B. Seely, C.B., C.M.G., D.S.O., M.P., attended a meeting of the Parliamentary Air Committee. Sir William Joynson-Hicks was in the chair. General Seely made a further statement regarding his resignation, in the course of which he is said to have laid great stress on Mr. Churchill's determination to keep the Royal Air Force under the control of the Secretary of State for War. The following motion was unanimously passed :—

"That this Committee expresses its deep anxiety in regard to the present union of the Air Ministry and the War Office, and the consequent position of the Royal Air Force, and requests the Government to announce its air policy at the earliest possible moment, and to provide a day for a full discussion."

It will be interesting to await future events. Perhaps the "anxiety" of the Parliamentary Air Committee will serve to defeat its own ends and bring about the abolition of the Royal Air Force, which is not the least of the evils brought about by the aid of the said Committee.

AIR POWER AND SEA POWER.

By "AUDITOR TANTUM."

Said the great Francis Bacon, Lord Verulam, "To be master of the sea is an abridgement of a monarchy," or, in other words, an epitome of sovereignty. This is so obvious and trite, and has been repeated in different ways with such "damnable iteration," that the Briton has at length got it into his noddle. Tell him every day in the largest writing that Somebody's Pills are worth a guinea a box and he will eventually take it as an established fact, and not as an opinion. Which is the secret of advertising and politics.

But "the old order changeth," and the vantage of strength at sea, which, says Bacon, "is one of the principal dowries of this kingdom of Great Britain," is in danger of losing its supremacy, which is passing to the sovereignty of another element. And the voice that proclaims this change with more authority and insistence than any other is, curiously enough, that of a distinguished seaman.

THE SOVEREIGNTY OF THE AIR.

Lord Fisher, who throughout his long life has always been in the front of progress, and is now more advanced in his ideas than most men of half his age, is quite revolutionary in his opinion of the effect of air-power on land and sea.

This is strange, for the British Navy, the most hide-bound and conservative Service on the face of the earth, was for long the most unbelieving in the possibilities of aircraft. *Malgré lui* the Navy took aircraft unto itself, but there being no faith, there was lack of works also.

"Air fighting dominates future warfare by sea and land." These words, spoken by the creator of the modern Fleet, have more significance than when the same words are shouted (as they have been) from the house-tops of the Aircraft Industry. And, the great sailor adds, the only way for a fleet to escape destruction in future will be for it to get under the water.

In which case, it is obvious, even if a fleet so constructed should be able to maintain the traditions of the Navy under the water as well as it did upon it, that the sovereignty of which Bacon spoke has passed from the sea to the air. For if the British Navy is compelled to submerge itself, with Admiral and Vice-Admiral, and all the Articles of War, it is clear that the compelling factor must be the superior.

"Himmel! Are these so beautiful shots for us meant. Heinrich?"

But what of the land? An army or a nation cannot usefully be employed in the bowels of the earth. The problem of the defence of the people of these islands is to be solved in but one way; by the creation of an overpowering air fleet. And it is at this moment, when the painful truth is being brought home to the intelligent section of the community, that the British Government is relentlessly reducing the already meagre building programme of aeroplanes, and completely cancelling the construction of airships.

NEWSPAPER AGITATION.

One of the strangest features of the case is that the group of newspapers which claims to have promoted aviation in this country has outbawled all others in their enthusiasm for economy in this direction. The "Evening News" stated a few days since that the skilled hands discharged from aircraft factories should be absorbed into some *useful trade*. Providing for the future safety of the realm is evidently not a useful trade. The fact is that the B.P. does not yet take aircraft seriously, and seems to think that the Government is similarly afflicted. It has an idea that, the war being over, our rulers have no further use for aircraft. A not altogether unfounded suspicion.

The attitude of the B.P. in general is that of a Felixstowe worthy, who, being interrogated as to the fate of the "Fury," replied: "It's a do, Sir, that's what I call it, nothing more'n a do. A naxident like that when the've got no more use for the thing, sets yer thinkin', don't it?"

THE ARGUMENTS FOR THE FLEET.

Arguments against Lord Fisher's dicta take three lines. 1. That the war proved that aircraft attacks against warships were largely failures, owing to the great height made necessary by anti-aircraft fire. 2. That submerging is very nearly useless as a protection; witness the efficacy of the depth charge. 3. That wars have ceased, and we shall have the Brotherhood of Man.

To take the last item first, the Brotherhood of Man is a hoary hoax, with "a very ancient and fishlike smell," an odour, in fact, of Red Herring. It is not in any way a discovery of Mr. Lloyd George for the rebuilding of the bad old world. "Mrs. Jellaby held a discussion with Mr. Quale, of which the subject seemed to be the Brotherhood of Humanity, and gave utterance to some beautiful sentiments."

After every great conflict there has arisen this idea of Universal Peace, and the war that was to end war. When Augustus had achieved the Imperial power, and "compassed earth with conquest, Heaven with fame," it was prophesied by Virgil, "Then wars shall cease and savage times grow mild, with iron bolt and chain firm closed the gates of Janus shall remain."

After the war with France in 1815, there occurred the same symptom, in conjunction this time with that passion for economy, the result of which was the inefficiency of the Army at the outbreak of the Crimean War.

The lesson is apposite now. There is imperative need for economy in the Services, but it must be economy applied with progress and reform. "Economy without a policy of reform is the creator of chaos and weakness on land and sea." And, it may be added, in the air.

THE VULNERABILITY OF THE SHIP.

The second argument is feeble, for if a vessel is not safe from aircraft attack when submerged, theoretically it should be at least as vulnerable on the surface. And the first argument relies on a supposition of gunnery efficiency which is rather staggering to those who have seen the Naval anti-aircraft gunner and his gunnery "loot" at work, and have marvelled at the deadly inaccuracy of his shooting.

Tales of this failing have been told in The Aeroplane, and there is a tawdry one of a gunner who put a shell through his own Admiral's flag while firing at enemy aircraft. The Admiral, being a disciple of Lord Fisher, is reported to have said—in effect—"You be damned!" And he was so.

It is, of course, a fact that the art of bombing war vessels is capable of considerable improvement. There was the case of the "Goeben," which was for some days heavily bombed as she lay beached in the Straits, some time before the Armistice. The writer saw her some months afterwards, and she appeared to be none the worse, although she was popularly supposed to have been destroyed for the third or fourth time in her career.

But as aircraft and bombing are both in their infancy, it is probable that Lord Fisher is right, and the surface of the sea will be no longer the exclusive theatre of operations of the Fleet, at any rate when the enemy is in the heavens above. A prophet having no honour in his own country, it is improbable that we shall have that submersible Fleet until other Powers have a few years' start of us. As Lord Fisher says, "All the brainy men said that aeroplanes were impossible. Yes! and we still have ancient Admirals who believe in bows and arrows."

The Councils of the British Empire seem to oscillate from panic to somnolence according to the attitude of the Press, and perhaps it would be an improvement to adopt some such system as the Gothis employed. The ancient Goths of Germany, as all the world knows, used to have a wise custom of debating everything of importance to the State twice: once drunk, and once sober. Drunk, that their Councils might not want vigour, and sober that they might not want discretion. Between the two a middle course was found which touched the points of wisdom.

A Submersible Fleet.

In itself, the idea of a submersible fleet is distinctly attractive, and a blind squadron manœuvring under water is a situation full of comic possibilities. Most of us still have a weakness for Jules Verne's "Twenty Thousand Leagues under the Sea," and could wish that the modern submarine had the comfort of the "Nautilus." As it is, going on board a submarine is like entering a sewer by the manhole.

It is to the internal combustion engine that Lord Fisher looks for salvation. The rest is easy. There is no impossibility in building a submarine of 20,000 tons, the difficulty is merely one of horse-power, and that will be overcome. But whether we get our submersible warships or not, the *sine qua non* of military power is a strong Air Fleet.

Indeed, it is not difficult to foresee a time when our Armed Forces will consist of the Under Seas Fleet, the Air Fleet, and a certain number of infantry who will be little more than the ground portion of the R.A.F. Cavalry will be useless, and the big gun, as a distinguished artillery officer has said, will be as obsolete as the catapulta and ballista of the Romans, and "the last argument of kings" will be the bomb.

It is cheaper and deadlier to carry your projectile and drop it on the spot, than to propel it with a costly charge with more or less uncertainty. No longer will there be any need for an Uncle Toby to "exasperate his symptoms in pursuit of the phantom Knowledge," endeavouring to discover the road that the cannon-ball did not go.

The Power of an Aerial Fleet.

A powerful Air Fleet would be a more potent factor in keeping the peace than even the British Navy has been, for the Fleet being confined to the sea, its effect is not felt in equal degree by all countries, whereas no country would be inaccessible to an Imperial Air Fleet, and the result of such an Armada in being might be such as that of which Cæsar spoke, when after the bloodless victory of Ilerda, he said, "That it was as much a General's duty to conquer by tactics as the sword." The threat of destruction would be sufficient.

Such appear to be some of the lessons of the Great War; but, as is usually the case, they will probably for some time remain unheeded, and the development of the Forces of the Crown on the lines required will be left to the mercy of chance, drift and political opportunity.

It will not be for lack, however, of a plain-speaking prophet, and Admiral of the Fleet Lord Fisher of Kilverstone, whose reorganisation of the world-wide machinery of the British Navy showed him to be a great strategist, and a man of immense foresight and imagination, is not likely to allow the authorities to remain slumbering in a policy of stagnation.

The cause of Air Power desperately requires a Fisher to put its case before the public as vehemently and remorselessly as the great seaman has stated that of the Navy.

THE FLIGHT TO AUSTRALIA COMPETITION.

The Vickers "Vimy" Machine.

The following letter was received by Vickers, Ltd., from General Sir W. Birdwood, G.C.M.G.:—

"I very heartily and sincerely wish all possible success to Capt. R. M. Smith, M.C., D.F.C., A.F.C., Australian Flying Corps, Lieut. K. M. Smith, R.A.F., and Serjeants J. W. Bennett, A.F.M. and W. H. Shiers, A.F.M., Australian Flying Corps, in their forthcoming attempt to fly to Australia.

"They know well that there is a very arduous task and very many dangers before them—but I know they will face them as fearlessly as they did the difficult and dangerous duties which have been allotted to them during the last five years and in the overcoming of which they helped to the final victory.

"I look forward to congratulating them in Australia.

"(Signed) W. R. Birdwood."

The following letter, written at Pisa by Capt. Ross Smith, pilot of the Vickers "Vimy" machine now on its way to Australia, has been received by Vickers, Ltd.:—

"We landed here just after 3 p.m. yesterday (Nov. 13th) from Lyons and have not been able to get away to-day.

"It took a lot of haggling to get our petrol and hot water for the radiators at Lyons, and we did not leave there until 10 a.m.

"When we got near here yesterday we decided we could not make Rome before dark, and as one manifold was badly gone we landed. Part of the aerodrome was sticky and we had to dig ourselves out of one patch.

"We had patched up the manifold at Lyons but it got worse and we found it had completely gone here and also burnt out part of the aluminium plate above the petrol strainer. The mechanics fitted another manifold and repaired the cowling, etc., but it was 11 a.m. before we were filled up and ready to start this morning (Nov. 14th). It was then raining hard with a strong south wind and low clouds, so we did not start.

"There is an R.A.F. officer and one mechanic here with petrol and oil, and the officer has done all he can for us, and the Italians have been sympathetic also. Capt. Horne (here) (of No. 1 Air Route) has advised us to go to Taranto and thinks Suda Bay, in Crete, is still available, so in view of having landed here we now intend to miss out Rome and go to Taranto from here and find out about the rest of the route to Cairo. Taranto is now H.Q. of No. 1 Air Route.

"It is still raining now (7 p.m.), but we have hopes of getting on again to-morrow if the aerodrome is not too wet.

"It was good flying yesterday from Lyons to here and the Riviera looked very fine and we are very fed up at this rotten turn of the weather, but still more fed up with our manifold.

"We are all very fit and the mechanics have worked like Trojans. So far we have not been able to take any cinema pictures, principally on account of the intense cold when flying, but we hope to start it next time.

"I like the 'Vimy' to fly very much and find she does 75 on the Pitot at 1,650 revs. That is what I am flying her at. The engines are certainly the best two I have ever had.

"(Signed) Ross Smith."

The following telegram from Rome, dated Nov. 15th, has been received:—

"Yesterday at Pisa heavy rain—aerodrome under water—attempted start—got bogged—spent day on machine—had engines running eight to-day—bogged badly taxi-ing—used planks—Italian mechanics dug out machine—bogged again—but finally got away—Sensational start—Bennett held tail down until machine moving then made running jump at rear cockpit—hauled aboard by Shiers as machine was leaving ground—aerodrome two inches under water but 'Vimy' rose beautifully—crew very wet but cheerful—encountered strong head wind—ground speed only 50 miles hour—passed through some heavy clouds otherwise hazy bumpy but landed Rome three o'clock.—Ross Smith."

The Vickers "Vimy" machine arrived at Suda Bay, Crete, on Nov. 17th and at Cairo on the 18th. It is stated to have left Cairo for Damascus on Nov. 19th.

The Blackburn Machine.

The Blackburn "Kangaroo" left Hounslow for Australia at 10.37 a.m. on Nov. 21st, in good weather.

It arrived at Romilly, 60 miles S.E. of Paris, at 3.0 p.m. on the same day, after passing through a heavy snowstorm over Amiens. The commandant of the aerodrome at Romilly received the crew with great courtesy, and has done everything possible for their comfort.

The commanding officer and navigator is Capt. G. H. Wilkins, M.C. The pilots are Lieuts. Val Rendle and D. R. Williams. Lieut. G. H. Potts is the engineer officer.

A note on the aviators and the machine was published in the Nov. 12th issue of The Aeroplane.

The Sopwith Machine.

Nothing has been heard of Capt. Matthews since the Reuter message of the 16th inst., which stated that the machine was detained at Gonsenheim, near Mayence, by bad weather.

NAVAL

ADMIRALTY APPOINTMENTS.

The following appointments have been made:—

NOV. 18TH.—Lieut.—H. E. M. Watkins (Capt., Temp. Maj., R.A.F.) promoted to Lieut.-Comdr., seny. Oct. 17th.

NOV. 19TH.—Comdr.—C. D. Longstaff, to "Furious," in command, Nov. 21st.

Nov. 22nd.—Comdr.—O. M. F. Stokes, D.S.O., to "Pegasus," in command (on recommg.).

* * *

H.M.S. "PEGASUS."

H.M Seaplane-carrier "Pegasus" will be recommissioned for service on the Mediterranean station, at Rosyth on Dec. 2nd with a Devonport crew.

MILITARY.

THE AFGHAN WAR.

On Nov. 13th the aerial operations against the Mahsuds began with an air raid on the villages of Kaniguram, Makin, and Marobi, five tons of explosives were dropped. All the machines returned safely. On Nov. 16th another raid was carried out on Shakai, north of Wana. It is stated that the Mahsuds are not particularly pleased with this method of warfare and are already making tentative approaches for Peace.

The terms presented to the Mahsuds and rejected by them included an undertaking of non-interference with aeroplanes flying East of the Durand line.

On Nov. 18th the villages of Ismailkhan and Zuran Atsar were bombed, and as a result of this the sections of the Wazirs who had absented themselves from the Jirgah at Sakka Khel came in and the whole tribe has now accepted the British terms unreservedly.

The aerial operations against the Mahsuds are continuing.

AIR FORCE.

THE AIRSHIP DEPARTMENT.

The Air Ministry announces that the Airship Department of the Admiralty has now been transferred to the control of the Air Council. All correspondence therefore should in future be addressed to the Secretary, Air Ministry, Kingsway, W.C.2.

THE W.R.A.F. OLD COMRADES' ASSOCIATION.

The following was issued by the Air Ministry on Nov. 22nd :—

All officers and other ranks of the W.R.A.F. who are serving or have served during the war will be interested to know that it is proposed to form a W.R.A.F. Old Comrades' Association.

It is felt that a great number of friendships were made between women serving in the Corps during the war period and afterwards, and that some opportunity should be afforded for the periodical renewal of these friendships, and it is the object of the Association to do this and to foster, as far as possible, the "esprit de corps" that existed in those days.

It is also hoped to form local branches to arrange reunions and to hold annual meetings of members.

Apart from its social side, the Association proposed to adopt practical means to assist members in obtaining employment, to help those who are in need of assistance, to endeavour to get suitable cases into homes, hospitals, etc., and to make arrangements, during their convalescence, for members who have been ill. Another possible development will be the exchange of hospitality between country members and those living in town.

Such an Association would not only preserve the spirit of comradeship that was one of the most admirable features amongst all ranks of those who served in the W.R.A.F., but should encourage preparedness to help the country in time of need should such occasion arise.

All officers and other ranks are invited to attend the inaugural meeting which will be held on Saturday, Nov. 29th, at 3 p.m., at Birkbeck College, Breams Buildings, Chancery Lane. Those unable to be present should write to the Secretary, W.R.A.F., O.C.A., 5, Red Lion Yard, Waverton Street, W.1, offering to form or to join local branches in the districts where they live.

The proposed rates of subscription are merely nominal.

A CERTAIN LIVELINESS.

During the morning of Nov. 21st a number of Sinn Fein men, believed to be in quest of arms, attempted to raid the R.A.F. stores distributing park in Marrowbone Lane, Dublin. The raiders were repelled after an exchange of shots. One of the raiders is said to have been injured. The police are investigating the matter.

AT LAST!

The result of some R.A.F. fencing contests in connection with a fencing match against the Army was reported last week. On November 19th, the Army and Air Force teams met with foil, sabre, epée, and bayonet. This was really the opening of the Services fencing season, and the keenness of the contests and the good attendance of spectators augur well for the success of the sport. Though the same three men represented the R.A.F. in each event they proved equal to the occasion, both in skill and stamina, and eventually won by four events to none, or 22 matches to 14.

The R.A.F. representatives were : Squadron Leader E. G. H. Clarke, Flight Lieut. F. G. Sherriff, and Serjeant-Major Grainger. They won the foils by 5 to 4, the sabres by 5 to 4, the epée by 6 to 3, and the bayonet competition by 6 to 3.

The skill displayed by the winners was of a high order, and was the more noteworthy by reason of the fact that while the R.A.F. relied on only three men (as already stated), the Army drew upon nine to represent them during the afternoon.

The Army teams were :—Foils : Capt. Wand Tetley, Capt. Smith, Serjt.-Major Elliott. Sabres : Col. R. Campbell, Major Huntingdon and Serjt.-Major Elliott. Epée : Col. Campbell, Capt. Wand Tetley, and Serjt.-Major Eggleton. Bayonet : Capt. Barnes, Serjt.-Major Reardon, and Serjt.-Major Reed.

THE FIRST VICTORY.

The R.A.F. XV scored their first victory of the season on Nov. 22nd in a game against the London Welsh at Herne Hill. From the outset it was a good game to watch, both sides playing strenuously. The forwards were fairly evenly matched, although the Welsh got the ball from the scrum more often. Behind the scrum the R.A.F. showed a marked superiority—the two new wings showing a great turn of speed.

In the first half the R.A.F. scored three times through Penny, Maxwell and Wagner, and Munday converted one of these. The Welsh scored one try, which was converted.

Half-time : R.A.F., 11 pts.; L. Welsh, 5 pts.

In the second half the R.A.F. were penalised several times, and from one of these kicks the Welsh scored a penalty goal. Soon afterwards they scored again from a break-away, and, this being converted, they led by two points. From this point the R.A.F. took charge of the game, and after Maxwell had been collared near the line, he gave the ball to Lees, who scored a good try, which was not converted.

Final score :—R.A.F., 14 pts.; L. Welsh, 13 pts.

R.A.F. Team : F. O. Damant, S. Ldr. Penny, Flt. Lieut. Thomas, S. Ldr. Neale, F. O. Wagner, S. Ldr. Smart, S. Ldr. Pulford, F. O Maxwell, Flt. Lieuts. Munday, Scroggs, Lees, Abbot, and Simpson, Serjt.-Major Patten and Serjt. Smith.—F. R.

THE C.F.S. (1918) DINNER.

A dinner will be held at Claridge's Hotel on Thursday, Dec. 4th, at 8 p.m., for the officers who served at the Central Flying School, Upavon, during the year 1918. The subscription is £3, including wines. Will officers wishing to attend please send their subscriptions and notifications to Major J. C. Slessor at the R.A.F. Club, Bruton Street, W.1., by Dec. 1st at the latest. Wing Commander A. J. L. Scott, C.B., M.C., A.F.C., will preside. Uniform or evening dress.

THE OLD COMRADES' ASSOCIATION, 7TH WING, R.A.F.

The First Annual Dinner of the Old Comrades' Association of 7th Wing Headquarters, R.A.F., was held in the "Flying Horse" Hotel, Nottingham, on Saturday, Nov. 15th, 1919. Col. A. G. Board, C.M.G., D.S.O., presided over a fairly good attendance.

DENMARK.

The Danish correspondent of The Aeroplane writes :—

Two more Naval flying pupils, Lieuts. Andersen and Sorensen, are leaving for England to receive their training there.

FRANCE.

A New French Aircraft-Carrier.

The new dispatch vessel "Bapaume" is to be completed as an aircraft-carrier, and will be attached to the Fréjus-St. Raphael Naval Air Station. At present the only aircraft-carriers the French have are the old "Foudre" and the converted liner "Campinas."

A Fatal Accident.

The escadrille under Capt. Metzergues returned to Tunis on Nov. 19th, after a flight to Casablanca. They reported the loss of a machine in the Kroumirie Mountains owing to bad weather. The pilot, Lieut. Thouzellier, and his mechanic were killed.

A Seaplane Flight.

According to a Reuter report of Nov. 20th, three seaplanes from St. Raphael have arrived at Rabat (Morocco), having completed the non-stop journey at an average speed of 94 miles per hour.

This apparently refers to the flying-boat escadrille which left St. Raphael for Casablanca on Nov. 1st. But one fails to see why the flight which has taken nearly a month to accomplish should be called a "non-stop journey."

ITALY.

According to recent information, Italian Service aeroplanes still lack magnetos and certain essential controls by reason of the Fiume affair.

JAPAN.

The Japanese Naval Authorities have decided to open a new Naval Air Station near the Kure Naval Base and Dockyard. A site at Himomura, in the Kama Province, is being surveyed now.

POLAND.

According to a report from Major Cedric E. Fauntleroy, the commanding officer of the Kosciuszko squadron, another American air squadron is being formed to serve with the Polish Army. The squadron will be named after Count Casmir Pulaski, the Polish patriot who fought and died for the United States. The two squadrons will be amalgamated in the Polish-American Flying Group.

SWEDEN.

The Danish correspondent of The Aeroplane writes :—

The Italian Visitors.

Lieut. Madelena, one of the four Italian officer-pilots at present staying in Stockholm, started in the morning of Nov. 11th for Helsingfors in the largest of the Italian aircraft with the Italian Naval Attaché, Count Gravin, and a mechanic as passengers, alighting safe in the harbour of the Finnish capital at 2 o'clock. The flying-boat was later presented to Finland.

Both Lieut. Madelena and the Squadron Commander, Count Robinet, have been decorated by the Swedish King as an acknowledgment of the Italian Naval aircraft gift to Sweden.

Propaganda.

The Swedish Naval Authorities have asked permission to spend a small part of the amount granted for the buying of flying material on the acquirement of an instructive film of 500 metres length, showing the proper way of alightment of seaplanes in high sea.

U.S.A.

Grades and Badges in the U.S. Signal Corps (Air Service).

The following document has been issued on the authority of the U.S. War Department :—

The Secretary of War directs that Paragraph 1269, Army Regulations, be rescinded and the following substituted therefor : Examinations for ratings of Military Aviator, Junior Military Aviator, Military Aeronaut, and Junior Military Aeronaut will be held at such times as exigencies of the Service require. Such officers as are recommended for these ratings by their commanding officers will be ordered by the Chief of Air Service before an examining board, to be composed of two officers of experience in Air Service and one medical officer, and to be convened from time to time by the Chief of Air Service to conduct such technical and physical examinations as may be prescribed. The medical officer of the board will take part only in the physical examination. The examination will be prescribed by the Chief of Air Service, and will be both theoretical and practical, and will include a demonstration of fitness of the candidate for advanced rank and command if any be involved in the appointment. No officer shall receive the rating of Military Aviator or Military Aeronaut until he shall have served creditably for three years as an aviation officer, with the rating of a Junior Military Aviator or the rating of a Junior Military Aeronaut, except that in time of war any officer or enlisted man who especially distinguishes himself in active service may be rated as a Junior Military Aviator, Military Aviator, Junior Military Aeronaut, or Military Aeronaut, without regard to examination or to length of service.

The Chief of Air Service will from time to time submit names of aviation officers qualified for rating as Military Aviators, Junior Military Aviators, Military Aeronauts, and Junior Military Aeronauts. Such rating to be announced in special orders, which orders shall cite the date of the rating in the case of each officer so rated. Each officer so rated shall receive a certificate to the effect that he is qualified for the rating, and while so rated is entitled to the rank, pay, and allowances authorised by Acts of Congress approved July 18th, 1914, June 3rd, 1916, and July 24th, 1917.

Paragraph 1584-3/4 is amended as follows : An officer of, detailed in or attached to, the Air Service who has demonstrated that he possesses the required qualifications shall, under such regulations as may be prescribed by the Chief of Air Service, be rated as "Airplane Observer," "Balloon Observer," "Aerial Gunner," "Aerial Bomber," "Airplane Pilot," or "Dirigible Pilot," as the case may be. The fact of such rating and date thereof, which is the date of final qualification, will be published in orders by the Chief of Air Service, and a copy of the order will be forwarded to the Adjutant-General.

The Secretary of War directs that no additional badges will be employed. The present authorised badge for military aviator (the double wings and the U.S. shield) will also be used by junior military aviators and airplane pilots. The aeronaut's badge (double wings and a spherical balloon) will be used by junior military aeronauts and dirigible pilots. The observer's badge (the letter "O" and one wing) will be used by airplane observers, balloon observers, aerial bombers and aerial gunners.

Aeroplanes and Engines in the U.S. Army.

The following tables have been extracted from the official "Air Service News Letter" of the U.S. Military Air Service dated Oct. 31st, 1919 :—

The Air Service reports 9,586 planes and 32,033 engines of all types on hand; 54 per cent. of the planes and 57 per cent. of the engines are of the active class.

Airplanes and engines are classified as "active," "obsolescent," and "obsolete." Obsolescent types will be used until the supply is exhausted, but no extensive repairs are to be made or additional spare parts manufactured. Obsolete types are those no longer used. They will be held until final disposal has been authorised.

Medals and Decorations.

The following piece has been extracted from the official "Air Service News Letter" of the U. S. Army, dated Nov. 7th, 1919 :—

Concerning the Wearing of Medals and Decorations.

The War Department authorises publication of the following information from the Office of the Chief of Staff :—

The new Army uniform regulations and specifications are now in course of preparation, but, pending issuance, the following changes in regulations concerning the wearing of medals and decorations is in force.

When dress and blue uniforms of the Army were abolished, it became impossible for any officers or men to wear the medals awarded them, as these were only authorised for wear on full dress uniforms, the ribbons, representing the medals only, being worn on field and Service uniforms. It is now the intention of the War Department to provide for the wearing of medals and decorations as follows :—

In the field no medals will be worn. It is optional with the

THE AIRCRAFT MANUFACTURING COMPANY LIMITED
AIRCO
HENDON, LONDON, N.W.9.

Chairman and Founder (1911): G. HOLT THOMAS

The Largest Aircraft Enterprise in the World

THE Aircraft Manufacturing Company, which with its associated Companies, is the largest aircraft enterprise in the world, is in a unique position to undertake the construction and complete equipment of aircraft for every kind of commercial, scientific and administrative purpose.

While many firms are dependent upon outside industries for essential parts of their output, the vast Airco resources and experience enable the associated companies to carry out practically every phase of modern aircraft construction in their own works and under their own skilled supervision. The importance of this fact will be appreciated by those responsible for the inauguration and development of public air services.

Among the highly specialised products of the associated Companies are:

HIGH-SPEED AEROPLANES, AIRSHIPS AND KITE BALLOONS, SEAPLANES AND FLYING BOATS, AERO-ENGINES, PROPELLERS, INSTRUMENTS OF PRECISION, etc., etc.

THE AIRCRAFT MANUFACTURING CO., LIMITED.

AIRSHIPS LIMITED. GNOME & LE RHONE ENGINE CO, (Peter Hooker, Ltd.),
MAY, HARDEN & MAY, Seaplane Base, HYTHE. INTEGRAL PROPELLER COMPANY, LTD.

London Offices: 25-27, OLD QUEEN STREET, LONDON, S.W.1.

individual whether or not he shall wear his ribbons. On certain formal occasions the Commanding Officer may require the wearing of medals and decorations. On social occasions their wearing is optional with the individual. On evening clothes, military and civilian, these decorations and Service medals are worn only on the left lapel.

Decorations, Service medals and badges, except aviation badges, will not be worn when equipped for the field, neither will they be prescribed for troops in the field. Officers suspended from rank and command and enlisted men serving sentence of confinement are prohibited from wearing any decorations, medals, badges, or substitutes therefor.

Decorations and Service medals will be worn when in uniform on the following occasions, unless especially prescribed otherwise. On State occasions at home and abroad; when receiving or calling officially upon, or acting as escort or aide to the President of the United States; the sovereign or chief executive of any foreign country, or any member of a reigning royal family; at all official and social functions at the White House; at escort to the Colour.

They may be prescribed by the Commanding Officer on the following occasions, when in uniform: For evening parades, formal reviews and inspections and funerals; on ceremonial and social occasions of a general and formal nature. They may be worn when in uniform, at the option of the wearer, on social occasions of a private nature and on holidays when not on duty with troops under arms.

When decorations and Service medals are worn under provisions of the above paragraphs, all those to which the wearer is entitled will be worn by officers and enlisted men in formation, officers and enlisted men not in formation, including reviewing and inspecting officers and their staffs, may omit the wearing of some for purpose of specially emphasising or giving special honour to those which they individually consider particularly appropriate to the occasion. On evening clothes, military or civilian, only one full size decoration or Service medal may be worn on the lapel; any number of miniatures may be worn, but full size and miniatures must not be worn together on the lapel. Service ribbons may be worn, on the white and Service uniforms. When any decorations or Service medals are worn, all Service ribbons will be removed or hidden from view. They will not be worn on the white mess jacket nor on civilian clothes. Badges, not to exceed three in number, may be worn on white and Service uniforms, but not on white mess jacket nor on civilian clothes. Badges of societies will not be worn with decorations, Service medals or substitutes therefor except at meetings, ceremonies or functions of the society in question. Civilian clothes, lapel buttons may be worn. The wearing of decorations, Service medals or miniatures should be limited to ceremonial occasions, then only when strictly appropriate to the occasion.

A foreign decoration or Service medal will not be worn alone, at least one American decoration or Service medal (or miniature in evening clothes) must always be worn with a foreign award.

A Helium Gas Committee.

The Secretaries of War and Navy have appointed a joint naval and military Helium Board composed as follows: Lieut.-Col. C. de F. Chandler, Chief of the Balloon and Airship Division of the U.S. Signal Corps (Air Service), alternates with Major P. Pleiss as Chairman of the Board. As members, Comdr. A. K. Atkins, U.S.N., and Comdr. H. T. Dyer, U.S.N., serve in alternation. Dr. C. F. Cottrell, Assistant Director of the Bureau of Mines under the Department of the Interior, has been appointed to represent that department, which is closely concerned with the problems affecting the production of helium gas. In his absence the department will be represented by the Chief Chemist of the Bureau, Dr. R. B. Moore. This board is formed "for the purpose of co-ordinating the various helium gas activities and requirements of the various Government Bureaus, including full control over the operation of the present and future Government-owned helium production plants, disposition of helium products, the conduct or supervision of conduct of further experiments undertaken with a view toward increasing the efficiency of the production plants, and to control further steps for conserving such sources of helium as may be deemed expedient."

At a meeting of the Board held on Oct. 23rd it was decided that the Bureau of Mines should conduct an exploration to locate sources of helium gas in the United States. The analysis of all gases supposed to contain workable quantities of helium will take about eighteen months. A helium laboratory is in existence at Fort Worth, Texas, and will shortly be enlarged. Dr. Seibel, who is an authority on helium, is in charge of the analytical work. It is expected that the oil and natural gas production companies in the United States will co-operate in this investigation.

A Gyroscopic Stabiliser for Aerial Cameras.

Dr. A. N. Lucien, Experimental Branch, Photographic Section, Air Service, has designed a gyroscope with a new dampening device. The model at present under test stabilises a small 5 in. by 7 in. aerial camera swung in gimbal brackets. The tests shows that the camera remains in the horizontal plane whatever the aeroplane may be doing at the moment. The value of such a device in aerial survey work cannot be exaggerated.

PROHIBITED AREAS.

The following is taken from the "London Gazette" of November 18th:—

ORDER OF THE SECRETARY OF STATE UNDER THE AIR NAVIGATION ACTS, 1911 TO 1919.

In pursuance of the powers conferred upon me by the Air Navigation Acts, 1911 to 1919, and all other powers enabling me in that behalf, I, The Right Honourable Winston Spencer Churchill, one of His Majesty's Principal Secretaries of State, by Order, make the following regulations amending the Air Navigation Regulations, 1919:—

1. Regulation 1 of the Air Navigation Regulations, 1919, shall have effect as though the following provisions were substituted for subsection (7) thereof:—

(7) The aircraft shall not land in any prohibited area as defined by this Regulation, and shall not fly over such area at a lower altitude than six thousand feet.

2. Schedule VI of the Air Navigation Regulations, 1919, shall have effect as though the following were substituted for paragraph 1 thereof:—

1. Each of the places named in the following list, as described therein, shall be a prohibited area:—

Orkney Islands.—An area enclosed by straight lines joining the following points:—Tor Ness, Rora Head, Inga Ness, Mull Head, Old Head.

Cromarty.—Seven statute miles in all directions from Newball Point (opposite Invergordon).

Firth of Forth.—An area enclosed by straight lines between the following places:—Hill House (one mile south of Dunfermline), Blackness Pier, Dalmeny Church, Inchmickery, Hallcraig Point.

Harwich.—Two statute miles in all directions from Parkeston Pier.

Osea Island.—Three statute miles in all directions from the centre of Osea Island.

Sheerness.—Three statute miles in all directions from Garrison Point, excluding Grain aerodrome and all land belonging thereto.

Chatham.—Three statute miles in all directions from Hoo Church.

Dover.—Three statute miles in all directions from Dover Castle.

Portsmouth.—Two and a half statute miles in all directions from Dockyard Clock Tower.

Poole Harbour.—Three statute miles in all directions from Lychett Minster Church.

Portland.—Two statute miles in all directions from Portland Castle.

Devonport.—Two statute miles in all directions from a point half a mile north of Stoke Church.

Pembroke.—Two statute miles in all directions from Wear Point.

Cork Harbour.—Two statute miles in all directions from Spike Island Fort.

W. S. Churchill,
One of His Majesty's Principal Secretaries of State.

Air Ministry, London, November 17th, 1919.

LORD WEIR AND THE W.R.A.F.

Among those made honorary graduates of Glasgow University on Nov. 19th were the Lord Weir and Commandant Dame Gwynne Vaughan, D.B.E. In the course of a long speech proposing "Town and Gown," Lord Weir said that the honour conferred upon him was a reflection of the admiration, pride, and wonder universally felt for the heroic work of the Air Force. He also heartily endorsed the honour conferred upon Dame Gwynne Vaughan for her wonderful work in the Women's Royal Air Force. No one ever commanded a corps composed of more honourable, gallant and devoted women, with higher character or principle, than the girls of the Women's Royal Air Force.

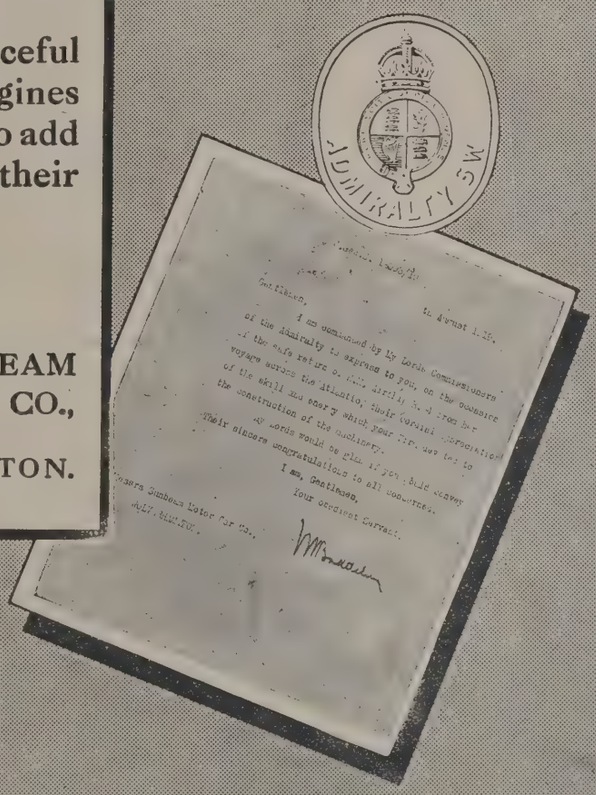
INTELLIGENT ADMINISTRATION.

An ex-R.A.F. officer tells a delightful story of the modern R.A.F. as related to him by a much-afflicted C.O.

One of the administrative officers under the said C.O. received a wire the other day to send four men to the Airship Station at *F*ulham, an obvious mistake for the famous Station at *P*ulham, Norfolk. The administrative officer being a thoroughly disciplined and obedient person duly sent the four men to Fulham. The teller of the story remarks: "Imagine these four men wandering up the Fulham Road, looking for an airship station. It is a good illustration of the idiocy of giving administrative commissions to flying officers or conversely forcing administrative officers to fly."

It is alleged that when the hero of this story was admonished for making such an obvious mistake he rushed off for the wire and pointed out the *F* where the *P* should have been, and stated that he could not be responsible for the mistakes of the Post Office.

A RESIGNATION.



Mr. E. W. Roberts (late Lieut., R.A.F.) is, owing to pressure of work, resigning his position as Secretary of the ex-R.A.F. Officers' City Luncheon Club.

SUNBEAM-COATALEN AIRCRAFT ENGINES

contributed in no small measure to the aerial supremacy which was largely responsible for the Victory which crowned the Allied arms.

And in peaceful times, these Engines will continue to add to the fame of their name.

THE SUNBEAM MOTOR CAR CO., LTD.,
WOLVERHAMPTON.

GREAT BRITAIN.

COMMUNICATION WITH AIRCRAFT.

The following "notice to airmen" was issued by the Air Ministry on November 24th :—

The Radio Telephony Stations at the Aerodromes at Hounslow and Lympne are now working on 900 metre wave length.

The registration marks of aircraft should be used as the call signs in making or receiving signals by wireless telegraphy or other methods of communication, except when opening up communication by means of visual signals, when the usual methods will be employed.

THE CONTINENTAL AIR SERVICES.

THE AIRCO SERVICE.

Sixteen flights have now been prevented and eight interrupted by the weather on the Airco London-Paris Air Service. Before each machine starts on its journey to France, it is brought round in front of the customs offices, so that passengers can be seen climbing aboard, and cannot do any smuggling. A medical officer, R.A.F., is in attendance at the aerodrome and examines all foreigners entering the country by the air route.

This week the times of the Bréguet mail-carrying machines have been placed in the table with the Airco machines.

Date.	Type.	Pilot.	Left Hounslow	Arr. Paris.	Left Paris.	Arr. Hounslow.	Pass.
Nov. 18th	D H. 9	Lt. Shaw	12.35 p.m.	2.35 p m.			Mail
	Breguet	M. Bajac			12 30 p.m.	3.00 p.m.	Mail
	D.H. 16	Capt. Baylis			12.30 p.m.	3 05 p.m.	1
Nov 20th	Breguet	M. Bajac	12.40 p.m.	3.00 p.m.			goods
	D.H. 16	Lt. Campbell-Orde	12.45 p.m.	2 40 p.m.			3
	D.H. 4a	Lt. Lindley	12.55 p.m.	2.55 p.m.			1 and Mail
	D.H 4a	Lt. Powell			12.30 p.m.	3.05 p.m.	1
Nov. 21st	D.H. 9	Lt. Bradley	12.55 p.m.	3 00 p.m.			1 and Mail
	D.H. 4a	Lt. Tebbit			12.30 p.m	3.25 p.m.	1
Nov. 22nd	D.H. 4a	Lt. Armstrong	12.45 p.m.	Landed L'mpne			Mail
	D.H. 4a	Lt. Lawford	1.10 p.m.	Landed L'mpne			1
Nov. 23rd	D.H. 9	Lt. Shaw			1.00 p.m.	3.30 p.m.	2

On Nov. 17th and 19th no machines started from Hounslow or Le Bourget owing to adverse weather conditions.

On Nov. 20th a Breguet machine, carrying the French mails, left Le Bourget for Hounslow, but was forced to land before reaching the French Coast owing to some minor mechanical defect.

On Nov. 21st a Breguet machine carrying the mails from Paris was forced to descend at Lympne and the mails were brought to London by rail.

On Nov. 22nd the DH4a, piloted by Lt. Lawford, crossed the Channel, but on reaching Calais encountered such bad weather that the pilot deemed it advisable to return. Both the machines which landed at Lympne returned to Hounslow on the following day.

THE HANDLEY PAGE SERVICE.

On Nov. 18th Capt. Davies flew a Handley Page machine from London to Brussels, carrying two passengers and 1,201 lb. of freight. Mr. Pager piloted a machine with two passengers and 238 lb. of freight from Lympne to Paris, and at three o'clock in the afternoon a Handley Page machine alighted at Hounslow from Paris with one passenger and 200 lb. of cargo.

During the week ending Nov. 19th, on the London-Paris service, 17 passengers and 1,224 lb. of freight were carried. Severe rain and windstorms made flying totally impossible on two days out of the week.

During the last 10 weeks a total number of 554 passengers and 9,637 lb. of freight have been carried on this service, and a distance of 26,850 miles covered. This has been accomplished without one accident, although the majority of the flights had to be carried out in bad weather.

On the London-Brussels service during the week ending Nov. 19th 14 passengers and 3,432 lb. of freight were carried.

A total of 206 passengers and 16,036 lb. of freight have been carried on this service during the last seven weeks, a distance of 12,850 miles being covered.

There is an increasing demand for the conveyance of freight from London to Brussels in Handley Page aeroplanes. Consignments of cloth, drapery, carpets and handkerchiefs are being carried to Belgium for sale in the stores of that city and Antwerp. Manufacturers in the North of England are utilising the service for the rapid conveyance of their products to the Continent.

"Carrying carpets to Brussels" is reminiscent of "Carrying coals to Newcastle."

On Nov. 20th Mr. Massot flew to Paris in 2¾ hours with a passenger and 428 lb. of freight. Lieut. Hope flew from Hounslow to Brussels with two passengers and 1,243 lb. of cargo, mostly drapery and woollen goods.

BOURNEMOUTH.

Weather permitting, the Avro Air Fleet will visit Bournemouth on Saturday, 29th, and Sunday, 30th insts. Exhibitions of flying will be given on both afternoons, starting at 2 p.m. There will be a sham fight, trick flying, and Miss Nellie Gibson will make her parachute descent. The Avro "Baby" will take part in the performance, and the Limousine will be there. The arrangements are in the hands of Mr. E. J. Hucks.

BRADFORD.

In spite of the heavy snow and gales of wind encountered during the week ending Nov. 23rd, the Berkshire Aviation Co. gave a flying week at the Leeds Road aerodrome, Bradford, without interruption. Many passengers were carried.

During the past six months the Berkshire Aviation Co. have carried more than 4,000 passengers, and the distance flown exceeds 18,000 miles. During this time only one minor mishap occurred, in which nobody was even scratched.

BROOKLANDS.

A correspondent writes :—One hears various rumours of private owners of aeroplanes taking over hangars on the Brooklands aerodrome, but there is nothing at present to show that such is the case.

At the Vickers works they are reported to be constructing an amphibian, a biplane, fitted with floats and landing wheels, which is to be tested soon at Brooklands. Sir John Alcock now has a residence in Weybridge, and will be engaged in testing work.

Contrary to what has hereinbefore appeared, the Air Navigation and Engineering Co. (Blériot's), of Addlestone, have not entirely stopped aircraft work. The works are reported to be devoting a small part of their energies to some special type of aeroplanes, of which no details are to hand.

A two-seater machine of large dimensions, but of orthodox Martinsyde design, fitted with a 450 h.p. Napier "Lion" engine, is being constructed by Martinsyde, Ltd. One is at present ignorant of the purpose for which it is being built. —J. F. S.

LONDON.

HOUNSLOW.—On Nov. 21st, two Airco DH9a biplanes, fitted with Napier Lion 450-h.p. engines, left Hounslow at 1.55 p.m., piloted by Lieuts. Robins and Game, for The Hague. One machine carried two passengers and the other their luggage.

MIDDLESBROUGH.

The Berkshire Aviation Co. are giving flights at a site at Middlesbrough this week ending Nov. 30th.

IRELAND.

Sanction was granted by the Cork Corporation on Nov. 14th to A. V. Roe and Co., Ltd., for the erection of an aerodrome in Cork : The town is to be used as a base for the air services to connect the principal towns and watering places.

THE BOULTON & PAUL—P. 9.

An Aeroplane which is a Sound Commercial and Private Proposition

In this P. 9 Machine we have, we feel, solved the problem of providing an Aeroplane which is a sound business proposition—and which combines with low cost the great essentials for Commercial and Private use. All our great resources of material and craftsmanship have been utilised. Scientific Research and Experiment by a staff associated with flying from its beginnings coupled with the great Experience gained through the building of thousands of Aeroplanes during the War, have been concentrated in the production of this P. 9 Model.

It is a Two-Seater—Single Engine Tractor—which has attained on test a speed of over 100 miles per hour.

Its outstanding features are :—

CHEAP AND EASILY HOUSED. The Initial cost is extremely low—£700—and the cost of running for a machine of this type and performance is reduced to a minimum. Owing to its small size it is easy to handle on the ground and requires but little accommodation. The principal dimensions are: Span, 27 ft. 6 in.; Length, 25 ft.; Height, 10 ft.

EASY TO FLY. The P. 9 has a big speed range, and low landing speeds, and this combined with Stability at all trimming speeds and well-balanced controls, allows the machine to be flown for long periods without undue fatigue. It also gives the maximum of Safety possible.

COMFORT AND CONVENIENCE. The comfort of the Pilot and Passenger has been specially considered. Each Cockpit is roomy and fitted with our special Seats. Controls for both Flying and Engine are fitted in the fron and rear Cockpits to enable the machine to be flown from either position. The exhaust from engine is discharged behind the rear Cockpit giving a silencing effect and freedom from fumes. Two standard cases are provided for luggage and form part of the fairing immediately behind the rear Cockpit.

The uses to which this compact and efficient machine can be put are wide and various, and will suggest themselves to those who have been awaiting the stage of Aeronautical Development now reached by the P. 9. It can be used for dozens of Commercial Purposes. The same type carried photos from R. 34 direct to London. It has been sent to Australia for Sheep-runs—and will soon be in use in various parts of the world for Exploring Uncharted Territory, Examining Timber Tracts, Fighting Forest Fires, Carrying Mails to Distant Mines, Transition of Colonial Mails to Mail Steamers, and for General Patrolling and Police Purposes.

£700 **If you are interested—write for full particulars. State your needs or purpose, and our engineers will consider every detail closely—to advise soundly.**

BY APPOINTMENT

Boulton & Paul Ltd.

NORWICH

LONDON OFFICE ADDRESS: 135-137, QUEEN VICTORIA STREET, E.C.4.

SOUTH AFRICA.

The first flight made by South African Aerial Transports, Ltd., was advertised to take place at Baragwanath Aerodrome (Johannesburg) on Oct. 25th, when the Mayor of the Town was to perform the naming ceremony and make the first flight.

The hours for flying at the aerodrome are from 9 a.m. to 11 a.m. and from 4 p.m. to 6.30 p.m. on Mondays, Tuesdays, Thursdays, and Fridays, and from 2.30 p.m. to 6.30 p.m. on Wednesdays, Saturdays, and Sundays.

Major W. E. Young, D.F.C., of the company, is O.C. at Durban. He has a new 110-h.p. Le Rhône Avro biplane, and flying was to start in the first week of November. The following matter is extracted from the Johannesburg "Star" of Oct. 30th :—

Flights are to be made at Maritzburg and a few other Natal centres, but the home of the machine is to be Durban. The original site selected not being ready, Major Young is endeavouring to obtain the use of the polo-ground as an aerodrome. If he succeeds, the machine will be housed in a shed, it not being expedient to construct a permanent hangar. The immediate programme so far as Durban is concerned is a series of passenger flights.

Major Young said that projected routes for regular services have been prepared as follows :—Johannesburg-Delagoa Bay *via* Imbabane; Johannesburg-Capetown *via* Kimberley-De Aar-Beaufort West; Johannesburg-Durban (possible stop at Newcastle).

Branch services : Johannesburg-Pretoria, Kimberley-Bloemfontein, De Aar-East London, De Aar-Port Elizabeth. It is intended to run two-engine machines, each with a capacity for 14 passengers, with a cruising speed of 90 to 100 miles per hour. The fares are difficult to estimate, but may average £15, though this figure will be reduced as support becomes assured.

The first flight was made by Major A. Miller. He flew from Johannesburg to Durban carrying a special edition of the "Johannesburg Star." General Smuts sent a message of congratulation on the flight to Major Miller.

DENMARK.

A Flight to Sweden.

Lieut.-Col. G. L. P. Henderson arrived at Copenhagen on Nov. 20th with his Armstrong-Whitworth biplane (160-h.p. Beardmore). He flew from Hamburg via Lybeck in two and a half hours. He intended to fly to Stockholm on the next day.

The Danish Air Traffic Co.

After much international and other negotiation, the Danish Air Traffic Company and Air Express have announced that they will start a regular service between Copenhagen and Warnemunde on Dec. 1st.

FRANCE.

The Paris-Melbourne Flight.

A Reuter message from Paris dated Nov. 24th stated that M. Poulet, who is still at Karachi, is receiving instructions from the British authorities regarding the route he is to follow in the further stages of his flight to Australia. M. Poulet has announced that if he arrives safely at Melbourne, after his machine has been overhauled, he will attempt to make a tour of Australia, over the desert parts of which no flight has yet been attempted.

GERMANY.

A New Record.

A message from Berlin states that the airship "Bodensee" made a new record on Nov. 20th. The journey from Friedrichshafen to Berlin was accomplished in three and three-quarter hours.

The Danish correspondent of THE AEROPLANE writes :—

The Effect of the Railway Stoppage.

The ten days' stop of all passenger trains on the German railways appears to have affected German commercial aviation similarly as the recent English railway strike stimulated British aviation, within the limits set by the reduced quantity of German benzole available which results from the low coal production, again the effect of strikes. Though the exact duration of the period of the cessation of railway transport facilities was known in advance, German organisation, skill and enterprise seems for once not to have come fully forward.

A private Berlin telegram to the Copenhagen news-sheet "Politiken" of Nov. 8th announced that activities on the regular air lines were to be restarted on the next day, mainly for mail and newspaper transport, though it was hoped, and depended upon negotiations with the fuel suppliers, that aerial passenger travelling could take place also.

It was announced beforehand that the airship "Bodensee," running on its regular service between Spandau by Berlin and Friedrichshafen, but not landing intermediately at Munich on the trip, would during the period be the chief mail link between central and southern Germany. However, it appears now that the airship has been in need of some overhauling—perhaps as a result of recent unsuccessful storm landing efforts at Berlin and ultimate successful emergency one at Magdeburg, for in the telegram referred to above it was reported that a flight of the airship to Friedrichshafen without passengers, but loaded with 2 tons of mail and parcel-post for South Germany, was likely, and that it would be ready after a short stay at the yard.

It is announced also that the demand for aircraft is increasing, artists requiring their services chiefly.

The lines to be restarted by the "Deutsche Luftrederei" were : Berlin-Johannisthal to Leipzig, Breslau, Hamburg, and Warnemünde. The latter forms, with the Danish ferry service to Gedser, the chief route to Scandinavia. From Warnemünde seaplanes were to link up to Sassnitz for the Swedish Trelleborg ferry line.

Rumpler Werke Aktien Gesellschaft were also to run two services, Berlin-Augsburg-Munich and Berlin-Leipzig.

The First After-War Prize.

Before the war General Direktor Edmund Rumpler offered a complete Rumpler "Dove" monoplane (which was never won) to the first pilot to fly from Berlin-Paris within 24 hours on an aircraft from his works. He has now handed in the first German after-war aviation prize of 20,000 marks to the Air Sport Commission, who will soon propose how the money is to be spent.

Fighting with Camera Guns.

An enterprising company, the Messter Optikon Film Co., has started photography fighting to employ the idle scout machines and their pilots in aerial show fighting, as demonstrated at the late Copenhagen aero exhibition. A Dutch branch has also been formed. A camera is combined with a gun, and 400 shots are fired per minute—i.e., one for every four revolutions of the screw. The film is marked with a cross where hit, and a combined watch registers at the same time the exact time with the accuracy of one-fifth sec.—HI.

ICELAND.

Capt. Cecil Faber, of the Danish Aviation Co., and late R.A.F., has just returned to Great Britain from Iceland, where he has been conducting an interesting experiment in popularising aircraft. The Danish Company sent him out there with a standard 504K Avro and two English mechanics, who had also served in the R.A.F. They established themselves at Reykjavik, and on September 3rd began to take up passengers.

The Icelanders had never seen an aeroplane before, so it was to be expected that they would hesitate at first to entrust themselves to such an unfamiliar contrivance. However, all things considered, they came forward in fair numbers to make flights. In three weeks 140 passengers were taken up, including several old ladies of 60 and upwards.

Capt. Faber remained there for three weeks, and during that time the weather was not all good. It was often gusty and there was a certain amount of rain. But the Avro behaved splendidly. There was no mishap of any sort, and none of the spares for either machine or engine had to be used. Consequently the first impression made on the islanders has been distinctly good.

Iceland seems to offer a very good field for the commercial use of aircraft. All the towns are on the coast, and communication is by steamer. It now takes two days' steaming to get about a third of the way round the island. By air the same journey may be made in four hours. The chances of aquatic aircraft seem to be particularly good.

ITALY.

The Italian correspondent of THE AEROPLANE writes :—

Trade Unionism for Aviators.

Attempts are being made from various centres to band together flying people, the better to move to the attack against the diffidence and sloth of the unenlightened, whoever and wherever they may be.

Postal Activities.

The daily postal service from Sardinia to Campiglia Marittima, Pisa, is now running again and a certain amount of flying duly controlled is being done, though the flying veto has not yet been removed.

The aeropost, carried on since July, 1918, by the 280th Squadron, under the orders of the Admiralty, from Milazzo to the Eolian Islands is now to be extended to all the various islands of the group, Lipari, Stromboli, etc.

Slipways are under construction at both the above places and are to be of a permanent nature in view of their evident usefulness for future inter-continental traffic. So the "Gazzetta dell'Aviazione."

By direction of the Disposal Board

AIRCRAFT DISPOSAL DEPARTMENT

MINISTRY OF MUNITIONS.

AEROPLANE DOPE

FOR SALE BY PUBLIC TENDER.

The following quantities of Aeroplane Dope are available for disposal :—

18,292 Gallons Cellulose Acetate Dope.
7,252 Gallons Nitro Cellulose Dope.
1,834 Gallons Mixed Dope.
6,000 Gallons S.33 Dope Solvent.

The material is located at Coventry, Sheffield, Liverpool, Hendon and Farnborough, where it can be inspected in bulk.

Tenders are invited for the whole or part thereof.

All enquiries for information and tender forms should be addressed to:

The Controller, Aircraft Disposal Department, Welcome Club, Earl's Court.

(Nearest Station—West Kensington—District.)

Telephone: Western 4950. Telegrams: "Clearhouse, Aerosupply, London."

IMPORTANT.—Please note change of address from York House, Kingsway, to Earl's Court.

NOTE.—For further particulars of other Government Property for sale see "SURPLUS" price 3d., at bookstalls, or by quarterly subscriptions of 2s. post free, payable in advance to the Director of Publicity, Ministry of Munitions, Whitehall Place, London, S.W 1.

A SAFETY FACTOR IN NIGHT FLYING.

Reliability of illumination is a actor which helps to lessen the ri.ks of night flying and night landing.

The unfailing reliability, strength and lasting brilliance of the OSRAM Lamp render it particularly suited for aeronautical lighting requirements.

Made in a variety of types and sizes to suit every requirement.

Ask for 1919 Price List.

THE GENERAL ELECTRIC Co., LTD., 67, Queen Victoria Street, London, E.C.4.

Branches throug out the United Kingdom and in all principal markets of the World.

Osram G.E.C.

THE IDEAL LAMP FOR AEROPLANE AND AERODROME LIGHTING.

A FLYING BILL.

A Bill dealing with flying is likely to receive the Royal signature in a few days. It merely regulates things on the lines of the decisions taken by the Fédération Aeronautique.

A FATAL ACCIDENT.

Lieut. Frank Rudorfer was killed while putting a S.V.A. through her acceptance tests at the Pozzo Strada aerodrome at Turin last week. As before stated, Ukrainia is buying some ten or twelve of these machines, and Rudorfer is thought to have been the usual victim of a belt coming unhasped when doing a steep turn. Anyhow, he fell out, and the machine after planing down landed badly.

THE FIAT OUTPUT.

The Fiat's B.R. has now a big sister which is thinking of taking the wind out of Jules Verne's sails on a globe-circling trip shortly. She is said to have a tank capacity of 5,000 kilometres. Ask Brack-Papa! By-the-bye, two of those 700-h.p. engines would make a nice power plant for the first real aero-char-à-bancs which happens—whenever it does.

MORE RECORDS.

As predicted in my last notes, Ing. Marchetti's new M. Vickers-Terni biplane, with 260 S.P.A., has beaten all climbing records at the aerobatics camp, Monte Celio, Rome.

The figures published are confounding, 5,000 metres in 11 minutes being mentioned in one report. The day was perfectly fine and calm, and the Aero Club's representatives checked matters. Serjt. Elias Luit was, as before, the pilot. One congratulates the inventor, anyway. The lines of the eel-like body alone are a fitting monument of a lifetime spent at work.

RACING IN 1920.

The famous Circuit of Brescia is to be revived next year with a really novel and useful programme. Two races only: A "Maximum Speed Variation" contest over a closed circuit of 1,000 kilometres with a compulsory amount of useful load, and a "Speed Contest for Pluri-motored Machines."

This last will be flown off in three heats. No. 1, 400 kilometres, using all motors. No. 2, a similar distance, but bi-motored machines to use only one, and tri-motored craft only two of their engines. No. 3, same distance, bi-motored machines using motors alternately and tri-motored 'busses only two, changing about. During No. 2 heat, machines are to reach at least 2,000 metres. One lives in hopes of seeing the Schnieder Cup flown for at Venice next September, too. Altogether the New Year promises to be interesting.

GABARDINI PRODUCTS.

When at Cameri the other day, Ing. Gabardini told me he was at work on plans for a tandem-plane. Also I saw the big vertical engine for the new Gabardini projectile. Although it was almost dark, he asked Sig. Zanibelli—who began flying at 16, by-the-bye—to take up the 50 biplane which I had never seen in the air. Signor Zanibelli graciously set out to do tonneaux and similar circus tricks to enlighten my darkness. Like all the other Gabardini stuff, the machine can certainly fly. Stretching himself out à la fingerpost on one leg, Chief Pilot Landini measures from toe to fingertip almost the whole length of the machine's body, if one excepts the rotary engine's cowl. The total surface is called 9 square metres.—T. S. H.

A TRANS-ALPINE FLIGHT.

A very difficult flight over the Alps was accomplished on Nov. 19th, when an aviator flew with a passenger in an Italian hydro-aeroplane, 80 h.p. engine, from Locarno to Zurich. There was a very strong headwind and a heavy snowstorm was encountered, but a cinema film was taken of almost the entire journey.

A WORLD'S RECORD CLAIMED.

Messages from Rome state that on Nov. 20th at the Montecelle aerodrome Elia Luit on a Marchetti aeroplane beat the world's record for speed by flying 171½ miles in an hour. With a new propeller it is hoped that a still greater speed may be achieved.

JAPAN.

During an experimental aerial-post service between Tokyo and Osaka, postage stamps were issued with an overprint representing a monoplane in flight.

NORWAY.

The Danish correspondent of THE AEROPLANE writes:—

"Det Norske Luft Rederi" (The Norwegian Air Navigation Co., Ltd.) has asked the Trade Department for a subvention of 1,2 million crowns (£66,700) on the finance bill for 1920-21. If the subsidy is granted they will, from May 1st, 1920, start a North Sea service from Stavanger to Scotland, as a link in the later northern European air line from London to Petrograd.

They will also start a coastal route, Christiania to Stavanger and a Christiania-Copenhagen connection over Gothenburg in connection with the Swedish and Danish air navigation companies, each sharing one-third of the traffic. Stops will be made at Arendal and Christianssand on the Stavanger route (see map on page 1194, THE AEROPLANE, issue of September 24th). The air services on both the last-mentioned routes will be run every week-day, even if to be run at a loss for a start.

Norwegian detailed cost estimations have been set up for the two services, the total expenditures on plant and building being calculated at 1,750,000 crowns (£97,222), in which sum nine 300-h.p. aeroplanes are included, reckoned each at 100,000 kr. (£5,555). Further, the stations are calculated to cost 310,000 kr. (£17,222) and 150,000 kr. (£8,333) respectively to erect.

The operating costs are worked out at 137,650 kr. (£7,647) monthly, all included. The operating cost per kilometre works thus out at 5,20 kr. (5s. 9½d.). Flying all work-days and with a reliability factor of 80 per cent., twenty flights should be carried out each way per month.

The share of the Norwegian company on the Copenhagen route is to be thirteen trips, the expenses on each of which are calculated at 2,600 kr. (£143). On the profits and revenue side three passengers are reckoned with at each trip, a fare of 250 kr. (£14), or 750 kr. (£42).—HI.

POLAND.

One learns from the German paper, "Luftpost" that an Aero Club is being formed in Posen. The Minister of Posts and Telegraphs in Poland has taken the notable step of making use of aeroplanes for transport work.

A Polish commercial firm has come to an arrangement with the British Handley Page Company to undertake the technical management of an air line running between Dantzig, Warsaw, and Krakau. It is said that each transport vehicle will carry about 1,500 kilos. of load.

PORTUGAL.

Mr. F. P. Raynham, who is demonstrating with a Martinsyde F.4 (300-h.p. Hispano-Suiza), on Nov. 11th flew from Madrid to Lisbon in 3 hr. 5 min. The distance is some 360 miles. The weather conditions were bad and there was a strong wind against him.

It is said that this machine is the first to fly into Portugal, and its arrival has created a great deal of excitement. Mr. Raynham landed at what is going to be the International Aerodrome, but which is now a ploughed field. He was to make a formal entry into the Military Aerodrome escorted by the Portuguese Flying Corps *en masse*.

Martinsyde, Ltd., hope to do a little business in Portugal and say that there appear to be splendid opportunities for aircraft development in the country and also in Spain, but very little money.

SPAIN.

An aeroplane flown by the French aviator, M. Bourgeois, fell to the ground from a height of 300 metres at the Andorra aerodrome (near Lisbon) on or before Nov. 21st. M. Bourgeois was killed.

The "Vickers-Vimy-Rolls" aeroplane which recently made a tour of the Continent is now at Madrid giving exhibition and passenger flights. His Royal Highness Prince Alfonso de Bourbon, cousin of His Majesty the King of Spain, was taken up as a passenger on Thursday, Nov. 20th, in this aeroplane. He expressed great satisfaction with the trip.

SWEDEN.

The Danish correspondent of THE AEROPLANE writes:—

NEW FLYING STATIONS.

The Swedish Air Navigation Co. has hired space for seaplanes at Askims Fjord, and by Tingstadssvarren for land-going aircraft, for the experimental Norwegian-Swedish-Danish air service, planned for next spring. It is hoped that a municipal flying station will be laid out, for which the technical and financial calculations have been given under Norway.

A correspondent writes from Sweden on Nov. 13th:—

THE ITALIAN PRESENTATIONS.

The only thing of any importance of late is the propaganda work done by the Italian pilots last week. They finished up here by a big show, in which they bedecked two of their boats with the Swedish colours, and said a few words on the great pleasure they had in presenting the King of Italy's greetings to the Swedish people, and also in presenting two of their boats to the Swedish Navy.

The Count had practised his Swedish and made the speech in that language. He was later presented in return with the Order of Wasa (First Class). The other two pilots were also presented with various Orders, and I believe also the mechanics. They have all left for Finland now, and are about to present their last machine to that Government.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

The German account of the Rolls-Royce aero-engine, which began in last week's issue, is completed in the following pages.

It has been necessary to interrupt temporarily the article on the experimental work of the Isle of Grain Experimental Station. Some account of the work connected with the development of machines for shipboard use will be given in a later issue.

Photographs of some machines built by the German Mercédès-Daimler Motoren Gesellschaft are given on page 1804. These machines are noteworthy in that they employ an engine of the 8-cylinder Vee type—a class of engine by no means usual in German aero practice.

A note on the applications of meteorology to the running of commercial air services by the meteorologist of the Air Transport and Travel Co. appears on page 1806.

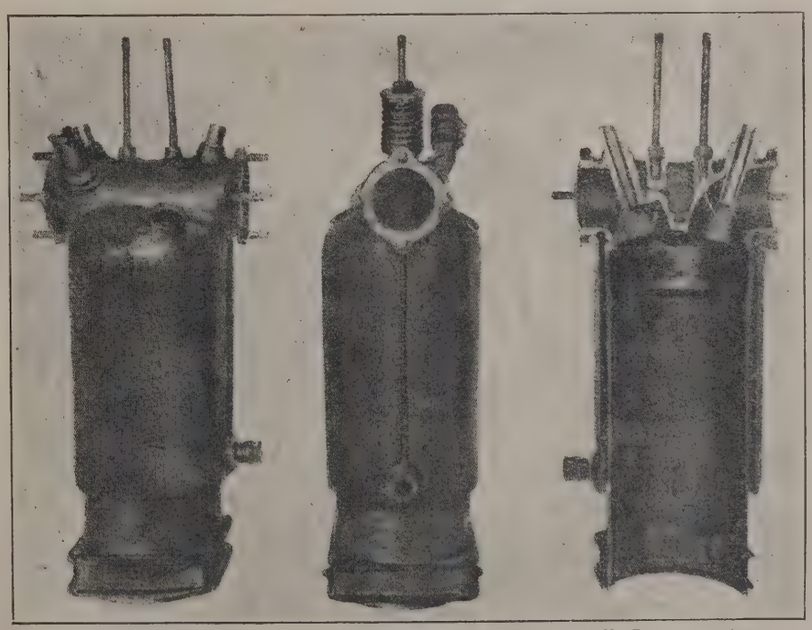
A GERMAN APPRECIATION OF THE ROLLS-ROYCE AERO ENGINE.

TRANSLATED BY ERIK HILDESHEIM, COPENHAGEN.

(*Continued.*)

The cylinders are made of steel, built up of several parts. To avoid large masses of metal round the valve seats, which are found in many models, short sockets are provided on the cylinder into which the valve caps are inserted. Hereby the welding is moved farther above the valve seats, improving thus the cooling efficiency of these important points.

For the inlet valve the valve stem guide is made in one part with the valve cap, together with a boss for the bolt holding the camshaft case. These parts are made separately at the exhaust valve and welded on to allow of cooling the stem guide. Special bronze bushes are pressed into the steel guide. Round the cylinder is a water-jacket pressed from sheet steel. All welding seams have been made very clean, no more welding material being employed than is absolutely necessary to obtain a tight and rigid welding seam. The plug sockets are screwed into the cylinder from above and welded to the water-jacket. No compression cocks are provided. The inlet and exhaust port flanges are screwed on to the pipes forming the valve ports.



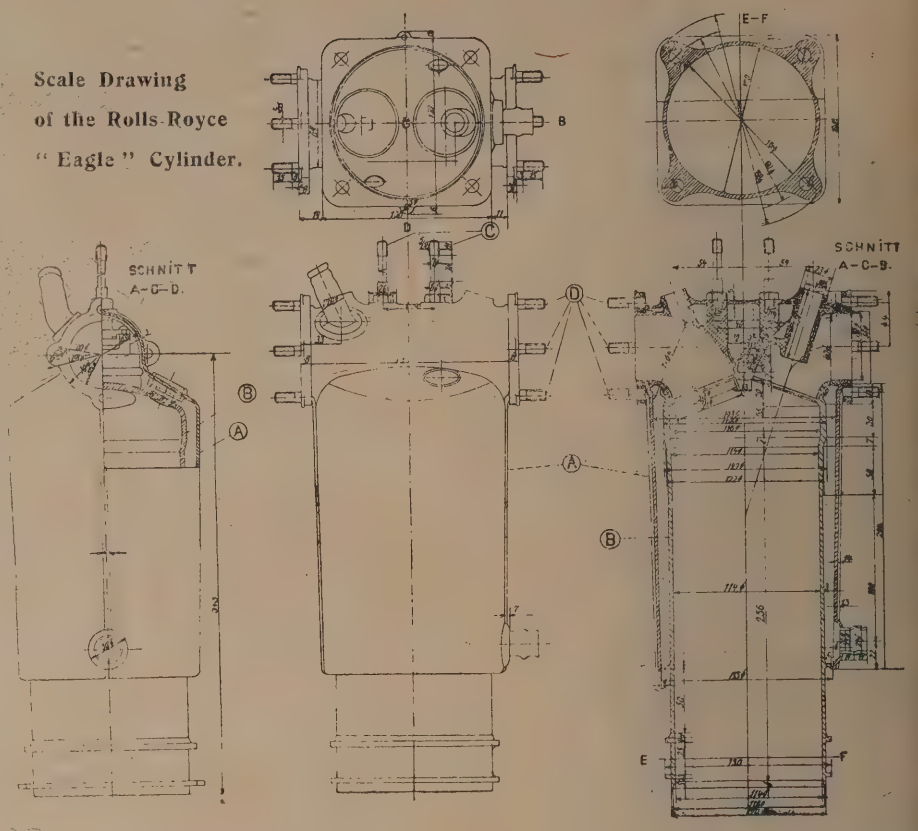
For mounting on the crankcase a very strong double flange is machined from the solid at the lower end of the cylinder, which scheme cannot be recommended too highly. The cooling water enters through a pipe at the lower end of the water-jacket from outside, leaving at the highest point of the water-jacket at the inner side of the angle between the cylinders. All outlet pipes of each cylinder row connect to a common water-pipe.

Inlet and exhaust valves are similar. Their form is the so-called umbrella model, which is only rarely to be found in aero-engines, though it produces very good flow conditions for the gases. The stem of the valves is lightened by being drilled, and a tempered piece of steel is screwed into the stem end and locked by a split pin to take the blows of the tappet. The washer for the two springs is screwed on and locked by a castle nut. The lower spring washer is a loose fit on the valve stem guide.

The valves are controlled by means of a camshaft, resting in a bronze case, made of three parts. It is shown with all details in a figure, so that a further description is not needed. No half-compression arrangement is provided, and in view of the small dimensions of the cylinders this can be spared.

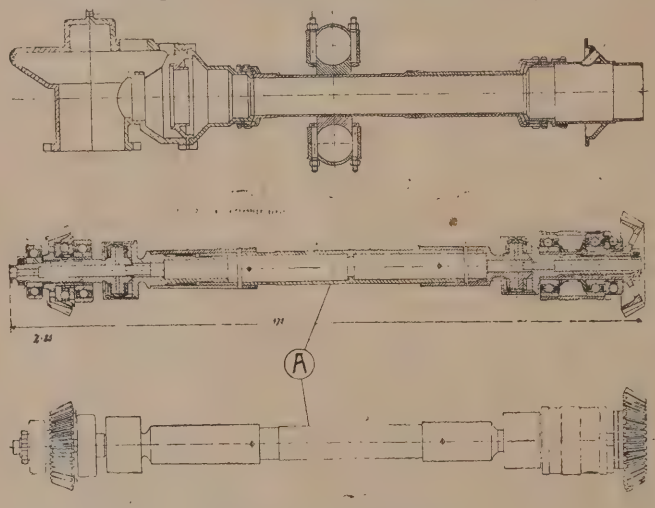
Automatic lubrication takes place through the hollow camshaft. At the front end of the case a flow of the oil downwards back to the crankcase is provided, while at the rear side the oil can return through the case of the driving shaft.

In older specimens the air-pump for the petrol pressure or the tachometer drive was mounted at the front end of the camshaft, but these parts have later found their places at the rear part of the case, which gives better protection of these parts and shorter lengths of pipes and shaft connections.



End, Side and Sectional Views of Cylinder of an "Eagle" Rolls-Royce engine.

The opening times and movements of the valves are good, which, combined with the high compression ratio, explains the favourable mean pressure of 8.7 kg. per sq. cm. for the 352-h.p. model.



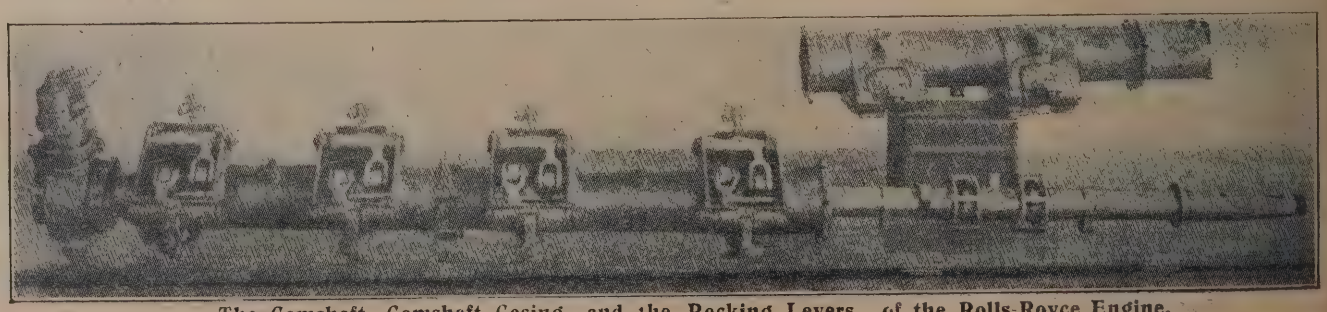
The camshaft drive contains a number of interesting intermediate parts. At the rear end of the crankshaft a worm-wheel is coupled with the shaft by means of a sprung clutch and a cone hub. The aim of this arrangement is to keep harmful torsion oscillations from the camshaft drive and the auxiliary apparatus driven by the worm-wheel

This worm-wheel has 24 teeth and engages a second one with 16 teeth that is mounted on a cross-shaft. Beside this worm-wheel, two spur bevel-wheels with 20 teeth are mounted on the ends of the cross-shaft and drive the intermediate shafts driving the camshafts through bevels of 30 teeth. The transmission first to a high number of revs. and then to a low one again is required, as two of the four magnetos are driven from the cross-shaft and have to rotate at $1\frac{1}{2}$ times the number of revs. per min. of the crankshaft. The camshafts are driven from these intermediate shafts by bevel-wheels of 50 and 25 teeth.

The intermediate shaft is a very clever and well-founded design. To keep an exact engagement of the spur bevel-wheel certain always, in spite of heat elongation and vibrations, this shaft is made to swivel in all directions. The vibrations are made harmless by top and bottom universal joints; to side movement attention is paid by means of a sliding splined hub construction, which is repeated in almost all drives and possesses many advantages compared with the cone and key locking, and with careful manufacture affords the highest possible reliability. The correct combination is always made certain by varying the width of the grooves. Lubrication of the universal joints is by the oil from the camshafts returning through the shaft and its case. In the same way attention has been paid to the circulation of the oil in the design of the intermediate case.

Scale Drawing of the Rolls-Royce "Eagle" Cylinder.

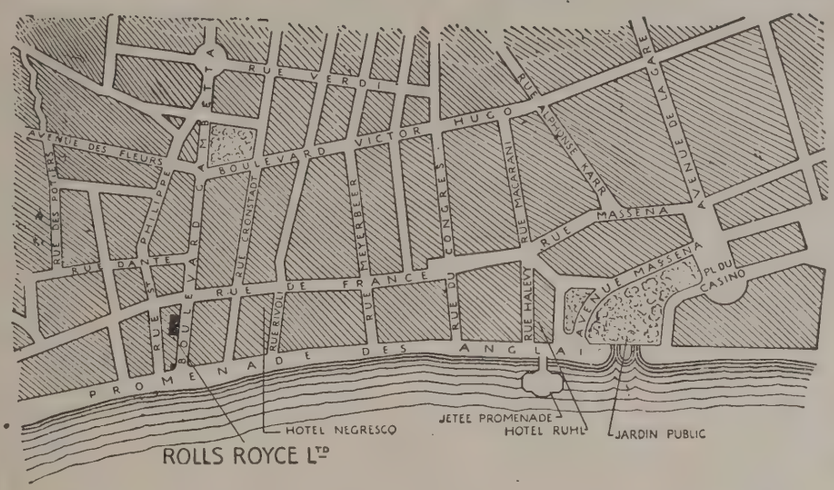
The Universally Jointed intermediate shaft driving the camshaft, and its casing.



One pair of magnetos is driven from the cross-shaft through a splined coupling and a spring buffer. The other pair of magnetos is driven by a second cross-shaft by the interposition of an intermediate shaft. The shaft arrangement of the second magneto drives is similar to the first one. This same cross-shaft serves at the same time for the drive of the tachometer and the air-pump, both of which are driven by worm-wheels.

The synchronised gun gear is made for two guns, and is driven from the rear end of the crankshaft. Running unengaged on the shaft the cam disc is driven at the speed of the airscrew by two pairs of gear-wheels, which are, together with the whole gearing, enclosed in an aluminium case. The cams operate each of the two trigger levers twice during each revolution. The contact points of the lever rollers with the cam disc subtend an angle of 153 deg., which depends upon the arrangement of the guns on the aeroplane.

The water-pump is also mounted on the rear part of the crankcase, and is driven by the worm-wheel on the crankshaft, with a transmission ratio of 1 to 1.5. The rotor is provided with double-side tread, so that the normal stuffing-box has only to tighten against suction pressure, which can be reduced to a minimum by a suitable arrangement of the cooling water circulation. Thus the risk of leakage and loss of water is very small. The rotor wheel with its shaft is made in one piece. On both sides of the rotor wheel the shaft runs in bronze bearings, lubricated by grease cups. The mounting of the pump with its drive on the crankcase is made in two parts.



The delivery piping separates at once aft the pump into two tubes, which are led along the two exterior sides below by the cylinders, diminishing forwards in diameter. From these pipes the cooling water is distributed to each cylinder, and having passed them collects again in two tubes mounted above the cylinders which lead to the radiator.

The ignition was originally arranged for single ignition, and accordingly only two magnetos were at first provided. Later twin-ignition was taken up and a second pair of magnetos added.

The Camshaft, Camshaft Casing, and the Rocking Levers of the Rolls-Royce Engine.

ROLLS-ROYCE

¶ ROLLS-ROYCE LIMITED ARE RE-OPENING THEIR GARAGE IN NICE AT 5/7 BOULEVARD GAMBETTA, FOR THE COMING SEASON 1919-1920, FOR THE BENEFIT OF THEIR CLIENTS WHO MAY BE USING THEIR ROLLS-ROYCE CARS DURING THE WINTER SEASON ON THE RIVIERA.

¶ AN EXPERT MECHANIC FROM THE ROLLS-ROYCE WORKS AT DERBY WILL BE IN ATTENDANCE FROM NOVEMBER 1st, 1919, TO MAY 1st, 1920.

¶ A COMPLETE STOCK OF SPARE PARTS WILL BE AVAILABLE.

¶ IT IS THE DESIRE OF THE ROLLS-ROYCE COMPANY THAT THEIR CLIENTS SHOULD HAVE EVERY POSSIBLE ASSISTANCE RENDERED TO THEM, BY THIS DEPOT, DURING THEIR STAY ON THE RIVIERA.

Rolls-Royce Limited.

15. Conduit St., London, W. 1

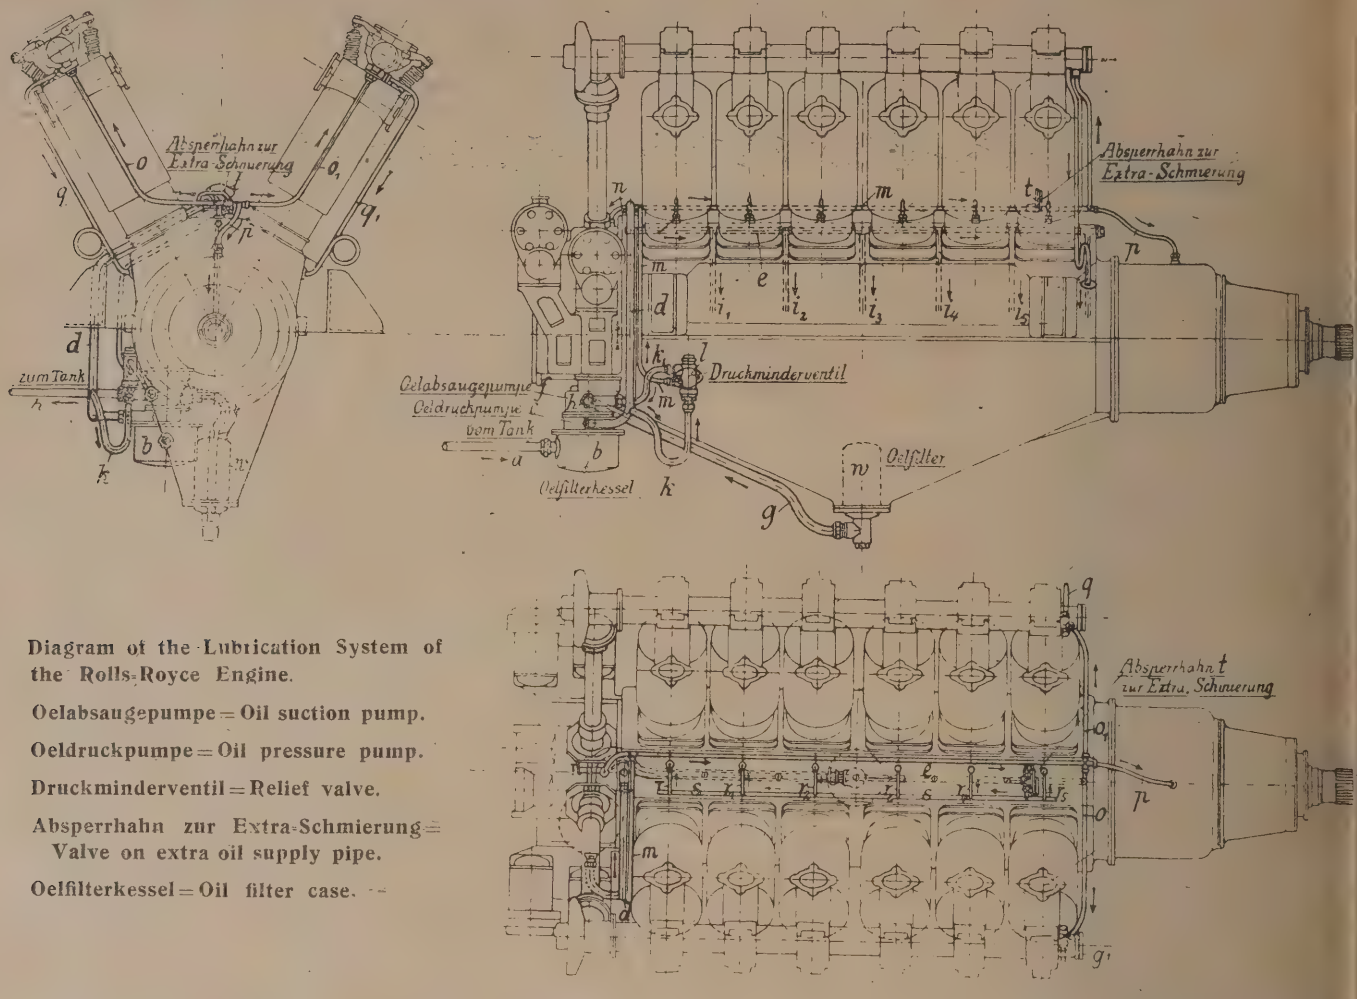


Diagram of the Lubrication System of the Rolls-Royce Engine.

Oelabsaugepumpe = Oil suction pump.

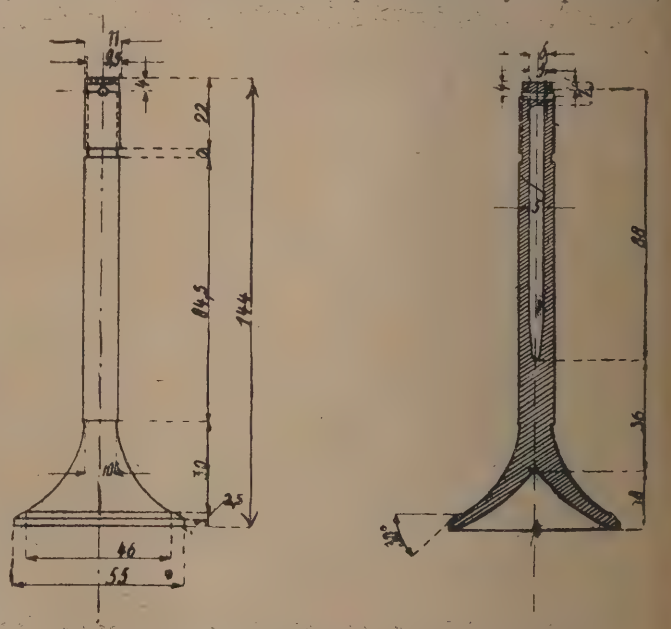
Oeldruckpumpe = Oil pressure pump.

Druckminderventil = Relief valve.

Absperrhahn zur Extra-Schmierung = Valve on extra oil supply pipe.

Oelfilterkessel = Oil filter case.

The lubrication is arranged according to the so-called "dry sump system"—i.e., the oil gathering in the deep lower part of the crankcase is continuously sucked off by the oil pump, passing through a filter, so that the case is practically oil-free.



A figure of the lubrication system is shown in detail.

The force-feed oil, sent by the pump, is lead to the oil-pipe for the main bearings, cast in the top part of the crankcase, through the pipe *d*. Shortly after the oil-pump a pipe *k* is branched off this tube and leads to a pressure reduction valve *l*. Here the oil enters first through a spring-loaded valve, a chamber, from which a narrow pipe *m* branches off, carrying the oil by *n* to the worm-wheel, driving the valve gear, and further forwards through the branch pipe *p* to the gear and through *p* and o_1 to the camshafts, from where it floats back to the crankcase through the pipings *q* and q_1 and the inclined driving shafts. Further, an auxiliary pipe *s* branches off the pipe *m* near the gear above a stop-cock *t*, small tubes *r*, r_1 and r_2 starting further off from the former and ending in the crankcase. By means of this auxiliary pipe extra lubrication can be applied when needed for running in new motors, the oil being injected direct on the connecting-rod bottom and bearings. Through a second spring-loaded valve in the head of the pressure-reducer abundant oil passes through the pipe *k* and back to the tank together with the oil from the oil pump of the crankcase.

The oil-pump is made as twin gear-wheel pump. The lower gear-wheel pump is surrounded by a wire gauze filter with a large surface and mounted in a small riveted case, to which the oil floats from the gravity oil tank. Above this pump a second gear-pump is arranged, pressing the oil, gathering in the bottom part of the crankcase back to the tank. Both pumps are driven from the worm-wheel for the valve gear drive by means of a worm-wheel with vertical shaft. As the speed of the former is too high for the oil-pump drive, a small epicyclic gear is provided for transmission, from the planet wheel of which the movement for the pump shaft is taken. The two pumps are clutched mutually together with this planet gear by means of a splined hub.

With respect to the carburetter the motor has undergone various changes. The first specimens were equipped with two twin-carburetters, but the newer engines are provided with single carburetters. The type of carburetter is the Claudel-Hobson model, much employed in hostile aero engines, and so may be assumed to be well known.

In the single carburetters two different editions are to be distinguished with regard to the altitude adjustment. While the old editions showed the regulation of the pressure in the float chamber of the Gillet-Lehmann regulation nature, also employed on the twin-carburetters, petrol throttling has been used for the new carburetters, the details of which are evident from a figure. The throttle-needle causes the pressure gradient between the float chamber and the jet to vary as required. Three different positions of this throttle-needle are marked on the carburetter: "weak" for altitude adjustment, "normal" for the normal performance, which worked out on brake at 320 h.p. for a petrol consumption of 226 grams per h.p. hour, and "strong" for a rich mixture. In this position the motor exceeds the normal performance by 10 per cent.,

The Valves of the Rolls-Royce "Eagle" described on page 1789.

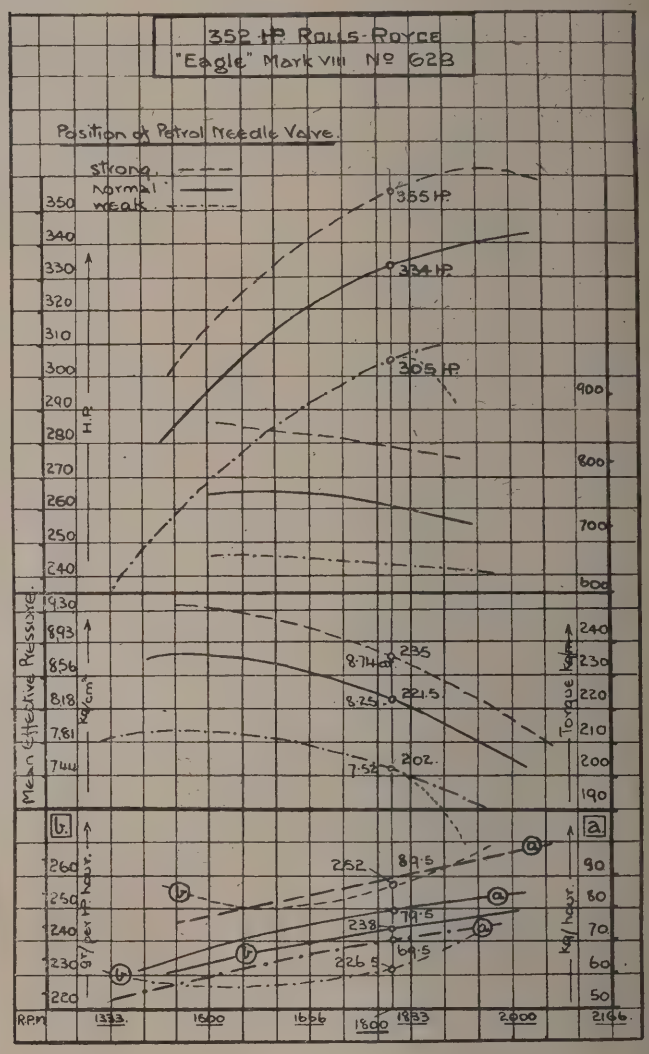
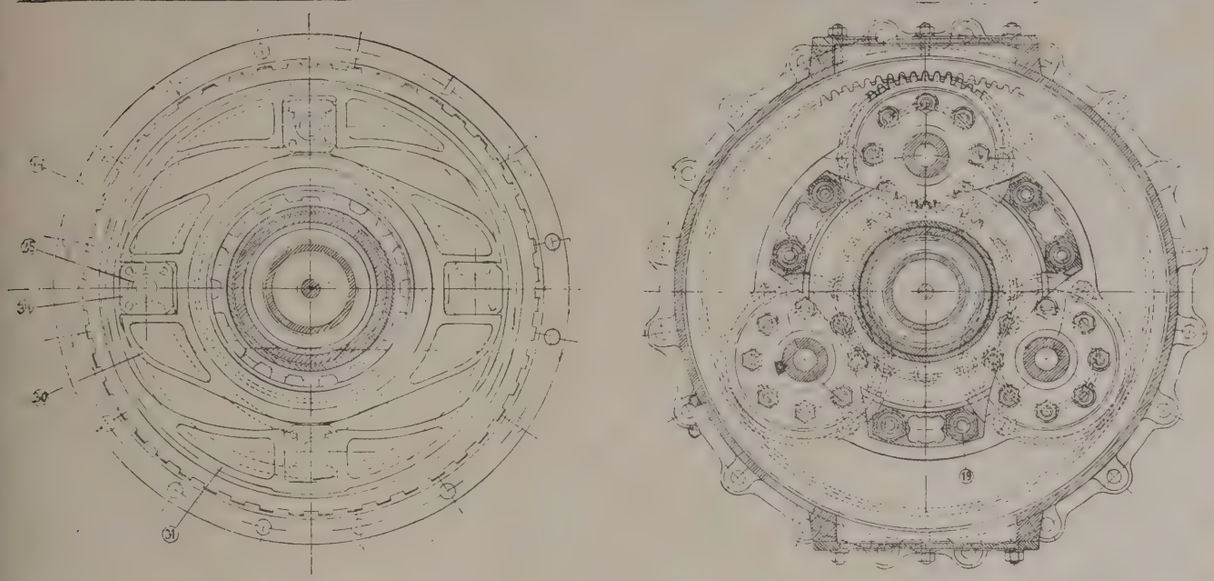
becoming 352 h.p. which is given on the signboard of the firm as full b.h.p.

The carburetter is not provided with a heating jacket, and can probably do without it, owing to the protected position between the cylinders inside the fuselage. No special pre-heating of the carburetter air is provided, as the air is drawn direct from the body, where sufficient warm air is available, the more when the radiator (of car type) is arranged between the airscrew and the motor. The induction pipe is, however, provided with a heating jacket, which is connected with the cooling water circulation. The value of this heating jacket is very questionable, as it possesses only a limited heating area, and, no doubt, it could be dropped without harm. To inject petrol into the induction pipe before starting, a nipple is provided on the underside, through which the petrol can be injected by means of a small hand-pump.



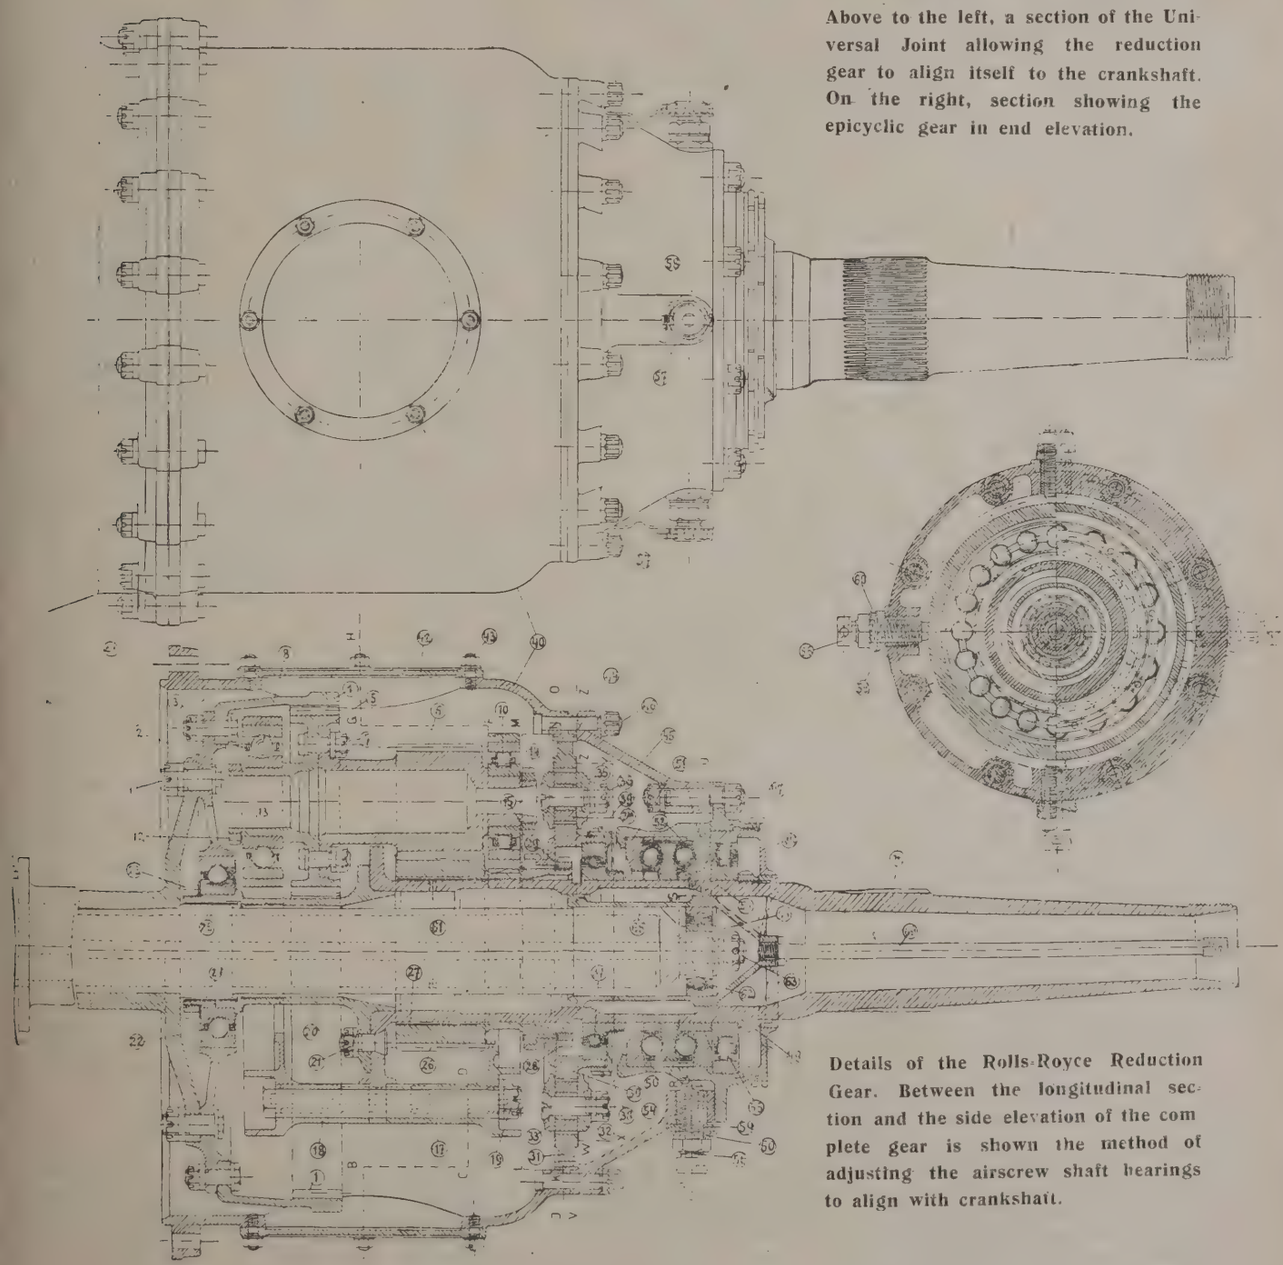
Assembled connecting rods of the Rolls-Royce "Eagle" engine.

For the petrol feed an air-pump is provided which is driven from the second magneto shaft by worm-wheels.



In earlier editions this air-pump was, as in many German engines, forward on the camshaft case, and thus always exposed to damage when the aircraft stands on its nose in landing. It is extraordinary that even the crankshaft of this air-pump is balanced by counterweights, which is owing to the high number of r.p.m. of the pump. The dimensions are very ample, so that sufficient pressure is still left, even in the deepest nose-dive, or with a large tank nearly empty. In former models sufficient attention was not paid to this need.

Yet in itself pressure-fed petrol must be regarded as an antiquated method for aircraft, as with a modern war aeroplane a non-force petrol tank is needed for fire safety. In this case the air-pump must be replaced by a fuel-pump, the construction of which is, however, rather difficult, especially with regard to packing and the suction capacity of such fuel-pumps, driven by the motor, is apt to diminish at great altitudes (above 21,000 ft.)



The Chart representing German test results on a Rolls-Royce "Eagle 8" engine.

The reduction gear for the airscrew is one of the most interesting parts of the design. It is made as epicyclic gear, and the airscrew shaft is at the same height as the crankshaft, which from the point of view of the aeroplane designer may be considered a drawback, as high landing chassis and thus high aeroplane designs are the result. It possesses, however, advantages to the motor designer. First, the form of the gear-box as a cylindrical body is very favourable for absorbing the stresses. A drawback results from employing ball bearings instead of journals in the reduction gear that with bearing adjustment of the crankshaft the ball bearings in the gear have to be adjusted also. This difficulty can be evaded either by providing the shaft with a universal joint or by allowing the gear-box to swivel in relation to the crank-case by means of a universal joint. In the Rolls-Royce the latter proposition has been chosen. Here the universal joint is found between the case and the shaft of the epicyclic gear, so that the shaft can take up a position as required

Above to the left, a section of the Universal Joint allowing the reduction gear to align itself to the crankshaft. On the right, section showing the epicyclic gear in end elevation.

Details of the Rolls-Royce Reduction Gear. Between the longitudinal section and the side elevation of the complete gear is shown the method of adjusting the airscrew shaft bearings to align with crankshaft.

inside the gear-box without interfering with the equal level bearing of the gear shaft and the crankshaft. The construction of this universal joint is shown in a figure. In relation to the gear-box only the double thrust ball bearing and front roller bearing for the airscrew shaft require adjustment. This adjustment is made by means of four strong pressure screws, provided in the gear-box. As these bearings adjust themselves by rotating of the motor, if the mounting and pressure screws are slackened, the difficulties of an exact adjustment are small.

The stresses are very low compared with the spur wheel reduction gears, otherwise used generally on aero engines, which is to be explained by the simultaneous engagement of three wheels. As regards the stress on the flank of the teeth, one which caused in so many cases the destroying of the flanks of teeth and thus lead to a failure of the reduction gear, this is decided by the radius of curve of the flank of the teeth at the contact point. The larger the radius the more favourable the stress is. For this case the internal teeth has an advantage, so that these stresses work out specially low, so far as the internal teeth are concerned, while naturally here again also the employment of three gear wheels engaging at the same time reduces this stress.

A further and no less important advantage is that small gear wheels and pitch suffice, so that favourable engagement and very exact manufacture can be attained.

Further, the epicyclic gear supplies an effective flywheel mass in the large internal teethed gear wheel. The only drawback to be found for the motor designer is the relative high weight. The impossibility of tempering and grinding the internal wheel is not a serious drawback, as non-tempered gear wheels suffice for the very low compressive stresses, which work out only at one third of the permissible figure for tempered wheels. Owing to the very small heating effect on the gear wheels the reduction gear requires no exceptional lubrication. Mainly the gear is lubricated from the crankshaft oil chamber, but a special oil pipe branching off from the camshaft lubrication takes a limited quantity of oil to the gear. The oil splashed off by the gear wheels runs back into the crankcase.

Finally, the results of tests on one of the latest captured Rolls-Royce motors are given. The motor ran faultlessly at all carburetter adjustments and showed no back-fire explosions even with weak mixtures. The regulation capacity is altogether good, as evident from the curves given, in which the mean pressure, the performance, and the r.p.m are recorded in their relation to the petrol adjustment position.

RECENT GERMAN WAR MACHINES.

II.—Mercedes Daimler.

The Mercédès Daimler Motor Gesellschaft have achieved aeronautical fame as the builders of the Mercédès aero engine, but it is not so generally known that they also manufactured aeroplanes.

It is not known certainly that any of the aircraft produced at their aeroplane factory at Singelfinden ever reached any of the fighting fronts, but they undoubtedly produced the machines illustrated. All the three machines shown are of extreme interest in that the photographs show that they are equipped with a Vee-type engine, which evidence of German origin shows to be an 8-cylinder product of the Daimler factory, nominally of 185 h.p.

The first of these machines—the L.6—is a single-seater fighter with a streamlined body of oval section, fitted with upper wings of slightly greater span and chord than are the lower ones,

The Mercédès Daimler "L.6."

The Mercédès Daimler "L.9."

fitted with a single row of interplane struts on either side the fuselage, and with the usual cable interplane wiring.

The second machine illustrated—the L.9 type—is also a single-seat fighter, but appears to be devoid of interplane wiring, and has but one single I-form strut on each side.

The third—the L.11—is a rigid truss monoplane of the parasol type, somewhat reminiscent of the Leonig monoplane.

The fairing of the axle, which is in the form of a heavily cambered wing section, should be noted. This feature is characteristic of certain type of German aircraft, and made an appearance in the early editions of the Fokker triplane.

In addition, the same works have turned out a type known as the L.8—a two-seater machine somewhat similar to the L.6, but fitted with upper and lower wings of equal chord and with a heavy stagger.

All the machines of this make are fitted with balanced ailerons, rudders, and elevators, and their general appearance suggests that they are of late 1918 manufacture.

Although the engine in all these machines is of the same general type, it would appear to have undergone sundry modifications, as each of the three machines illustrated has a slightly different arrangement of exhaust pipe, which seem to involve changes in the position of the exhaust ports on the engine.

A Mercédès Daimler Monoplane, the L.11.

THE WEATHER AND COMMERCIAL AVIATION.

By R. BERNARD, F.R.MET.SOC.
Meteorologist to Aircraft Transport and Travel, Ltd.

One of the most noticeable features of the articles and speeches made by the authorities on Aerial Travel is the persistent reference to meteorology. No one who has studied problems of reliability of an aerial service can doubt that the question of weather is one of the most important factors, but although mention of it is invariably made, little has been written as to the actual methods of obtaining and using such information as is available.

It was only during the last year of the war, one might almost say months, that the value of elaborate weather information for aerial work was recognised; the weather expert was looked upon as a crank, and his failure to forecast on Monday what the "weather for the next week-end" was to be caused many sarcastic remarks, and very little faith was placed in his forecasts. The directors of flying operations, if they consulted the meteorologist at all, wanted to know what the actual weather was like, and not what the meteorologist thought it would be, and as a natural result a system of direct reports by telephone grew up which no doubt proved invaluable, but at the same time caused the purely scientific aspect of meteorology to fall rather into the background.

There is, perhaps, some justification for the sceptics who have seen long-shot forecasts, such as those issued to the newspapers, go wrong; but when one considers that they are virtually forecasts for 36 hours ahead in a country that is noted for its changeable weather, it is extremely creditable to the forecaster that the percentage of failures is not larger. It is, however, no criterion that because of these failures it is impossible to place reliance on scientific meteorology for commercial purposes. When the actual requirements of an aerial service are considered it will be seen that on the system of short-stage working as advocated by Mr. Holt Thomas a forecast for six hours ahead will cover nearly all requirements, and such a forecast can be given with a high percentage of accuracy.

Information is available in the shape of simultaneous observations by skilled observers throughout N.W. Europe four times daily, and we can thus roughly split the 24 hours into four periods, which mean that four six-hour forecasts will cover the whole day, and the flight organiser will always have a reasonably accurate knowledge of what the weather during the whole of any of these short-stage flights is going to be.

It is on such a system that the Meteorological Department of Messrs. Aircraft Transport and Travel, Ltd., is being organised; arrangements have been or are being made to receive from the Air Ministry Meteorological Department and the Meteorological Office all the observations above, and although the department has only been in active existence for about two months it is already receiving and using information which has not hitherto been supplied to any commercial firm.

From this information maps are at once drawn, showing the weather over the whole of North-Western Europe, on similar lines to those compiled by the Air Ministry and Meteorological Office, and it is on the information revealed by such mapping of the various weather characteristics that forecasts are based.

In addition to these details, reports of pilot balloon ascents at various stations in the British Isles and France are received. These balloons give the direction and velocity of the upper winds, and this is also plotted on maps, giving at a glance the direction and velocity of the currents in the upper air.

The direct reports which are obtained by the Air Ministry hourly complete the chain of information, and the department, with the whole of the foregoing information at its command, is in a position to give reliable reports to the company's aerodrome managers and pilots for practically any aerial route in North-Western Europe.

I have so far confined myself to details of information received by the company's meteorological department, but what is perhaps of more interest is the information that the department can place at the company's disposal. It will be advisable to consider briefly what weather information an aerodrome manager or pilot requires.

This falls naturally under two headings: information as to weather conditions well in advance to enable arrangements for the flight to be made, and to prevent unnecessary work if conditions are to be too bad for flying; and information given to the pilot of conditions over his actual route at the time of the start of the flight, together with particulars of any expected changes during the flight.

With regard to the first, forecasts are issued twice a day (later these will be issued four times daily), giving general conditions as to wind, cloud height and amount, visibility, etc., and the probable changes in these features during the ensuing periods. At present one is issued at about 10 a.m. covering the period up to 5 p.m., and at between 4.30 and 5 p.m. another is circulated giving the prospects for the ensuing evening, night, and following morning. These forecasts must naturally be divided into districts, and at the present time are confined to South-East England, Channel, and Northern France; but the department is in a position to give forecasts for any district in North-Western Europe if required.

With the morning forecast a map is issued giving at a glance the actual cloud amount, height of clouds, visibility, surface winds and upper winds at about half a dozen stations between London and Paris, and with the afternoon forecast a similar map showing conditions at about 15 places distributed over the district south of a line drawn from Spurn Head to Liverpool and extending to Paris.

The particulars given to a pilot at the start of his journey are based on the information contained in the direct reports received from the Air Ministry, and include particulars as to the *actual* weather conditions at points over his route during the preceding hour, and in some cases as recent as the preceding half-hour.

In addition to this he is informed of any variations likely to be encountered, together with a forecast of probable changes during the time of his journey. Wherever possible he is also supplied with particulars of the strength and direction of the wind at different heights to enable him to take advantage of any favourable wind-current.

One of the principal uses to which the department is being put is the compilation of statistics of climatic conditions over the company's prospective routes. It is an example of the thorough way in which the organisation of the company is being built up that no route which is contemplated gets past the embryonic stage without the consideration of the effect that weather conditions will have on the percentage reliability of service which can be maintained on such route, and the statistical information which has been and is being collected is proving invaluable.

THE BRITISH INDUSTRIES FAIR (BIRMINGHAM), 1920.

The committee of management of the Birmingham Section of the British Industries Fair have succeeded in overcoming their initial difficulty, and have now secured buildings which will provide them with 150,000 sq. ft. of space for the housing of their exhibits. The rapid booking of space has had an effect which will in the ultimate result be of widespread benefit—it has, in short, compelled the committee to make a drastic alteration in their original arrangements, and they are to be heartily congratulated on successfully negotiating for and obtaining the loan of the extremely suitable buildings which were erected during the war at the Castle Bromwich Aerodrome.

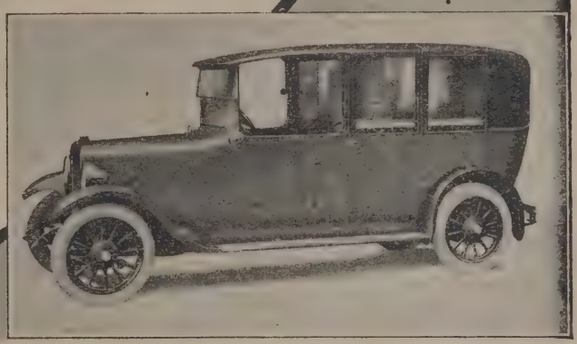
The Air Ministry has consented to the buildings being used for the purpose, and this means that there need be no further irritating limitation of space—that exhibitors showing their products in two or more groups will be able to have the same under their eye, as it were, without traveling to other locations—and finally that the buyers who have more than one interest will not be called upon to move from one district to another. The site has many natural advantages: firstly, the buildings could not be better suited for the purpose; secondly, the station (Castle Bromwich) is practically in the grounds on which the buildings stand; and thirdly, there are railway sidings for the occupants' special use.

It is understood the subsidiary arrangements are as under: the Town Hall will be used as a reception bureau for all buyers visiting the fair, and here they will be able to obtain all the needed information as to hotel accommodation, transport services, places of interest, and the many other points on which strangers to the city will require assistance and advice.

A special service of trains will be run on the Midland Railway from New St. Station, and at regular and frequent intervals during the whole period of the fair motor-'buses will leave the Town Hall for the Aerodrome, and the Aerodrome for the centre of the city.

One effect of the new situation of the fair is that, while at present some 500 firms have taken space, within a very short time all those firms who have been hesitating will undoubtedly apply, hence every firm who is desirous of widening its trade connections should make immediate application for space.

Letters should be addressed: General Manager, British Industries Fair (Birmingham), Chamber of Commerce, Birmingham.



What flying has taught us—

The demand of the aeroplane for the utmost power from the lightest and most trustworthy engine, and our concentration on that problem, has taught us much—and each owner of the new Austin "Twenty" will benefit thereby. More power with less weight and greater reliability combined with silent running, flexibility and marked economy are characteristics of the new Austin "Twenty" and assure its selection by discriminating motorists.

The new **Austin** *"Twenty"*

The "Bristol" Aeroplanes

"BRITAIN'S PIONEER AIRCRAFT CONSTRUCTORS."

The "BRISTOL" Tourer has proved a great success as a high grade, speedy and dependable machine for the conveyance of passengers or cargo, whilst the "BRISTOL" mark is a guarantee of sound design and excellence of construction. Its principal dimensions and performances are:

Wing Span	39 ft. 3 in.
Overall Length	25 ft. 9 in.
Maximum Height	10 ft. 1 in.
Petrol Capacity	70 gals.
Best Speed	125 m.p.h.
Cruising Speed	90 m.p.h.
Range	560 miles.

Further particulars of this and other "BRISTOL" machines will be supplied on application.

MODEL EXPERIMENTS AND FULL-SCALE RESULTS.

With the approval of the Technical Department and under the auspices of the Société Française de Navigation Aerienne, M. Toussaint gave a very interesting lecture on the aerodynamic progress made by the Germans during the war.

M. Toussaint, who is recognised by everyone who has had anything to discuss with him as the foremost technical authority on aircraft construction in France, is the director of the Aerotechnical Laboratory at St. Cyr and also in charge of the Testing Squadron of the French Technical Department (corresponding to our Martlesham Heath).

As is well known, the German professors at the Aerodynamic Laboratory at Gottingen carried on their pre-war programme of experimental study without any reference to the war, and indeed complained officially in 1918 that the official "experts" were making no use of the epoch-making discoveries they had made.

It is in order that French aircraft constructors should have the advantage of these discoveries before their authors are able to make use of them that the Technical Department have arranged for this lecture and the publication of the diagrams and formulæ.

Very briefly, these eminent professors have determined very simple formulæ by which, given the graph and characteristics of model tests of a given wing, one can calculate to within an error of 2 to 3 per cent. the exact head-resistance of a given cellule, and separate out the resistance due to the form of each wing, the resistance due to work done (lift and drag separately if desired), and the increased resistance on each wing due to mutual interference, with exact corrections for swept-back or variable curve wings, etc.

In short, one can calculate from the model the "sigma" of the resistance curves of the graph for a given full-size machine.

M. Toussaint has proved these figures against the known model and full-scale figures for the major part of Allied aircraft, and the error in every case is less than 3 per cent.

When it is remembered that the British "experts" still contend that it is impossible to calculate full-scale figures from models, the value of these German formulæ will be immediately apparent, and it shows remarkable foresight on the part of the French authorities in having circulated this information amongst French constructors so quickly. In one week it brings French practice ahead of the British, and will prove an imporant factor in next year's competitive designs.
—John Strong.

A DOUBLE LIBERTY.

The United States Air Service authorities have constructed a 24-cylinder Liberty engine by the process of joining two upper crankcase halves, each with its 12 cylinders, one inverted and the other the right way up, and making certain alterations to the connecting-rods.

It is said that the engine thus constructed gave 673 h.p., weighed 1.97 lb. per h.p. dry, and used 0.55 lb. per h.p.-hour.

As the 12-cylinder engine is said to give 400 h.p., it appears that the 24-cylinder set was run at a lower speed, or that the compression was reduced.

THE WIRELESS SOCIETY OF LONDON.

The Wireless Society of London held their first general meeting since the war at the Institution of Civil Engineers, Westminster, on Tuesday, Oct. 28th. The meeting was attended by over 150 members.

The President, Mr. A. A. Campbell Swinton, F.R.S., was in the chair, and opened the meeting by referring to the state of suspended animation the Society had been in during the war, and that with the close of the war the Committee and Officers had met and decided to bring the Society into activity once more. Owing to the resignation of Mr. R. H. Klein from the office of Hon. Secretary, Mr. Leslie McMichael had been asked, and had agreed, to take over the duties entailed. Mr. Klein had been elected an Acting Vice-President. Admiral Sir Henry Jackson, G.C.B., F.R.S., one of the very earliest experimenters in wireless telegraphy had also been included, and was taking keen interest in the welfare of the Society. Dr. F. C. Knight had been made a Member of the Committee. The meeting was invited to confirm these appointments, and, by an amendment, it was decided that the present Officers and Committee should remain during the year 1920.

The President spoke of the loss sustained to the Society by the death of Sir William Crookes, O.M., Mr. Russell Clark, O.B.E., Prof. Silvanus Thompson, and Mr. Dudell, and a number of members had unfortunately lost their lives in the war.

The matter of licences for wireless telegraphy was touched upon at some length, and it was pointed out that every effort has been and will be made to influence the Post Office authorities to come to some decision, so that experimental work among amateurs may again be established.

Mr. Hope Jones, M.I.E.E., the Chairman, spoke of the application of other wireless societies and clubs with a view to unity of action, and said that the Committee were alive to the possibilities, and further developments may be expected—in the meantime, all secretaries of wireless societies and clubs are invited to communicate their views to the Hon. Secretary.

After the business of the meeting closed, the attention of members was directed to an exceptionally interesting show of wireless exhibits which had been brought, and brief descriptions were given. Dr. Erskine Murray explained details of the Air Force telegraphy and telepathy sets exhibited, including a Robinson Direction Finder. Mr. Scott Taggart had a fine array of valves, made by the Ediswan Company, showing their manufacture in detail. The Marconi Company and Messrs. Read and Co., and the Zenith Manufacturing Co. had lent some of their most up-to-date apparatus. Mr. Maurice Child, Mr. Burbury, Mr. Clinker, Mr. Leslie Miller, and Capt. Donisthorpe had brought pieces of interest, and the President had on exhibition a compact and sensitive valve amplifier, which, together with a specially constructed loop aerial, was capable of making signals from European stations audible at a considerable distance from the telephones.

[The reference to the R.A.F. use of telepathy is somewhat startling, but it is presumed to be a typist's error, and that telephony is meant.—Ed.]

A NEW FRENCH ROTARY ENGINE.

A French engine, of which little has yet been heard in this country, is the "Sega," built by M. Seghers, of 11, Rue Scribe, Paris. This engine, in its first edition produced in 1917, gave 250 h.p. for a weight of 0.85 kg. (1.87 lb.) per h.p.

A new model, giving 500 h.p. for a weight of 0.65 kg. (1.43 lb.) per h.p. is, it is said, to be exhibited at the forthcoming Paris Aero Show. This engine is a 9-cylinder affair, with extremely novel valve gear, which it is not yet permissible to describe.

A NEW REVIEW.

A new technical publication, entitled "La Vie Technique et Industrielle," has recently made its appearance in France. This review, which is excellently produced, is practically an index of the important articles in technical and industrial subjects which have appeared in the newspapers of the world during the previous month. Those who are interested in industrial production in its higher phases, will do well to write to the Director of "La Vie Technique et Industrielle," at 18, Rue Seguier, Paris, 6, and ask for a specimen copy.

THE ROYAL VISIT TO OLYMPIA.

Readers will probably be interested to learn that whilst at the Motor Show at Olympia this morning (Friday, Nov. 14th), Her Majesty the Queen, accompanied by Her Royal Highness the Princess Mary, honoured Messrs. Mann, Egerton and Co. by a special visit to their Stand. Her Majesty was graciously pleased to inspect the bodies exhibited, which were made at the Norwich works of the company, and showed special interest in a saloon body on an Armstrong-Siddeley chassis, and a Coupé body on an Austin chassis. All will appreciate this signal honour shown to a Norfolk firm.

20TH CENTURY MASCOTS.

At the present moment it seems quite the thing to ornament the radiator filler cap of one's car with some form of frightfulness ranging from a golliwog of the Domestic Bazaar Co. type, to a streamline nymph "en deshabille" carried out in silver. There must be many people in the R.A.F. who were wont, during the late war, to fly with a horrible monstrosity, characterising the British toy, squatting astride the Pitot tube or Aldis sight.

Now that flying is, at any rate, for most people, a luxury only to be indulged in during a war, it is possible, by the introduction of the 20th-Century Mascot to reverse the order of things and carry a scale model aeroplane on the radiator cap of that expensive British toy—the motor-car.

Rogers Bros., of the "Tabloid" Aero and Engineering Works, Farnham Royal, Slough, are producing a series of scale model aeroplanes, ranging from a twin-engined Handley Page to a Bristol monoplane or a Sopwith "Pup," made in brass, heavily silver-plated. They are riveted and hard-soldered together, and are, therefore, quite able to stand all shocks and vibration likely to be met with in a car.

They can also be mounted on suitable stands as paper weights, ash trays, ornaments, etc. The models range in size from 5½ in. to 12 in., and are absolutely to scale. A complete range of all types of standard service aircraft are ready, and if drawings are available any type of machine can be made to order.

L. C. Rawlence and Co., Ltd., of 40, Sackville Street, W., who are the sole London agents for these models, showed some specimens on their stand at the Olympia Motor Show, and some models are also on view in the windows of the Lepaerial Transport Bureau in Piccadilly Circus, W.

(*Continued from page 1786.*)

AWAITING A HANDLEY PAGE.

The H.P. hangar has been erected here for the past two weeks, awaiting the machine which so far has failed to arrive.

AN "ACK WAGON."

Col. G. L. P. Henderson, M.C., is due here this week or next with a large "Ack Wagon" for the P.O. Flygkompani. It is fitted to carry two passengers, and the company believes that it will do a lot of work.

THE FATE OF THE RIVALS.

The Svenska Lufttraffik, the only rivals of the P.O. Flygkompani, started work the other day, with a German pilot and a seaplane, they also cut the Flygkompani's price by 50 crowns and threatened to go even lower, but they had to pack up on the second day, owing to all the waterways and the seaplane harbour being frozen over.—K. F. S.

SWITZERLAND.

The Danish correspondent of THE AEROPLANE writes :—

AD ASTRA.

The German quarterly aero review, "Illustrated Flying World," reports that in the first days of November a Swiss Air Navigation Co., Ltd. (Aviation Suisse S.A.) was formed in Zürich under the name of "Ad Astra," with the aim of making air stations at the chief Swiss traffic centres. The company will be served by army pilots and mechanics, trained by the Government, and will keep also a stock of aircraft ready for flight and at the disposal of the Government.

Much consideration was given to the choice of type of machine. Seaplanes were finally decided upon for air traffic, as most resorts are situated by the lakes. Italian 180-200-h.p. engined Savoia two-passenger aircraft and some land-going machines are to be considered.

A continual aerial service, Geneve-Luzern-Zürich-Friedrichshafen, is already being prepared, joining the service to Berlin.

The "Ad Astra" is purely a Swiss enterprise, with Swiss money and personnel. The technical manager is Lieut. Wild, who is stated, before and during the war, to have been in the service of an Italan aeroplane company. (One remembers a Lieut. Wild, who was the designer of a monoplane with his own propeller, produced by Gustav Otto in Munich. This machine, piloted by Baierlein and with the designer as passenger, won the first German Aerial Derby round Berlin. It was looked upon by all competitors as a freak, but beat them all by some 10 min. in the pure speed contest.)

So that the service might be started this autumn with a relatively small capital the formation of the Zürich and Luzerne stations only has been decided for the present. At Zürich a shed has been erected near Zürichhorn on ground placed at the disposal of the company by the city.

The company is expecting the arrival of a large German flying-boat which the Swiss Flight Lieut. Frick has gone to fetch from Friedrichshafen. It is stated to be a quite new type (likely a variant of the model from the Lindau works of the Zeppelin concern in Bavaria), with a gliding gondola, 15 m. in length, and with a beam of 2.6 m., above which two unsupported Maybach motors of 270 h.p. each are mounted.

The pilot's cockpit is in front of the propellers, and the passenger-cabin with seating accommodation for six persons is below. The flying-boat weighs 3 tons when empty and more than 4 tons when loaded with crew and fuel. It is made exclusively of an aluminium alloy with the exception of the planes, and should thus be fireproof. It is to stay one or two months in Switzerland to carry out tests.—HI.

The Italian correspondent of THE AEROPLANE writes :—

A NEW COMPANY.

Great activity is reported by all correspondents and also officially at Dubendorf. Recently twenty Zeppelin-built C.2 machines with 200-h.p. engines were delivered there for a company now being formed. Evidently the Huns can deliver the goods.

THE DEMAND FOR ITALIAN WATERPLANES.

The Avions-Tourisme Company of Geneva and the Ad Astra firm at Zurich are taking delivery of various Italian-built and designed waterplanes. One is glad to learn that Macchis and S.I.A.I. machines have been going into the territory of the Confederation fairly frequently.—T. S. H.

UNITED STATES OF AMERICA.

THE TRANSCONTINENTAL AIR ROUTE.

The Army Aeroplane Race, New York-San Francisco, made the air route between the Atlantic and Pacific Oceans a reality, suitable for practically every type of machine, and marked by sufficient landing grounds, with short distances separating each. The greatest distance being 180 miles between Buffalo and Cleveland.

The route chosen over the Rocky Mountains is the one which entails the least amount of high flying, although machines have to rise to perhaps nine or ten thousand feet to safely clear the mountains. Rivers, valleys and mountains, etc., have been utilised to the greatest extent possible in fixing a route that can be followed easily from the air.

The landing grounds, with distances from the East, are as follows :—

Mineola (Long Island), Binghampton, 142; Rochester, 267; Buffalo, 323; Cleveland, 503; Byran (Ohio), 650; Chicago (Ill.), 810; Rock Island (Ill.), 965; Des Moines, 1,123; Omaha, 1,241, St. Paul (Neb.), 1,373; North Platte (Neb.), 1,491; Sidney, 1,603; Cheyenne, 1,696; Rawlins (Wyo.), 1,809; Green River (Wyo.), 1,946; Salt Lake City, 2,083; Salduro, 2,183; Battle Mountain (Nev.), 2,345; Reno (Nev.), 2,514: Sacramento, 2,626; San Francisco, 2,701.

There is a curve to the North between New York and Buffalo which might be straightened out to the route flown over by the mail-aeroplanes from New York-Chicago. This route is due west out of New York to Bellefonte (Pa.). The highest landing ground on the transcontinental route is Rawlins (Wyo.), which is 6,623 ft. above sea-level.

Some of the above-mentioned landing grounds have just been laid out, some are Army Stations, and others are only open spaces. But all have been mapped and charted, and provide a start on which much development may be based.

THE ROYAL AERO CLUB NOTICES.

FLYING SERVICES FUND COMMITTEE.

A meeting of the Flying Services Fund Committee was held on Thursday last, November 20th, 1919, when there were present Group Captain C. R. Samson, C.M.G., D.S.O., R.A.F., in the chair; Squadron Leader T. O'B. Hubbard, M.C., R.A.F.; and the Secretary.

Applications for Assistance.—Forty-three applications for assistance were considered, and grants and allowances were voted amounting to £478 10s.

FRENCH RECORDS.

The Royal Aero Club has received from the Aero Club de France the following French records established during 1919 :—

ALTITUDE.

Aviator alone : Jean Casale, Issy-les-Moulineaux, June 14th, 1919, 9,520 metres.

Aviator and one passenger : Jacques Weiss, Villacoublay, August 13th, 1919, 9,000 metres.

Aviator and four passengers : Bossoutrot, Toussus, April 1st, 1919, 6,290 metres.

Aviator and thirteen passengers : Bossoutrot, Toussus, April 3rd, 1919, 5,090 metres

Aviator and twenty-four passengers : Bossoutrot, Toussus, May 5th, 1919, 4,360 metres.

THE RAYMOND ORTEIG $25,000 PRIZE.

PARIS—NEW YORK; NEW YORK—PARIS.

CROSS-ATLANTIC FLIGHT.

(Under the Competition Rules of the Aero Club of America.)

A prize of $25,000 has been offered by Mr. Raymond Orteig, of New York, to be awarded to the aviator who shall cross the Atlantic in a land or water aircraft (heavier than air) from Paris or the shores of France to New York or from New York to Paris or the shores of France, without stop, within five years from May 28th, 1919. (The flight may be made either way across the Atlantic.)

Qualification of Competitors.—The competition is open to persons of any allied nationality holding an aviator's certificate issued by the International Aeronautical Federation and duly entered on the Competitors' Register of the Aero Club of America.

Entries.—The entry form, which must be accompanied by the entrance fee of $250, must be sent to the Secretary of the Aero Club of America, 297, Madison Avenue, New York City, at least fourteen days before the entrant makes his first attempt.

No part of the entrance fees is to be received by Mr. Raymond Orteig, the donor. All amounts received will be applied towards payment of the expenses of the Aero Club of America in conducting the competition. Any balance not so expended will be refunded to the competitors.

Starting Place.—Competitors must advise the Aero Club of America of the starting place selected, and should indicate as nearly as possible the proposed landing place.

The start or landing may be made from land or water. If a land plane is used, the point of starting or landing must be within 50 miles of Paris or New York. If a seaplane or flying boat be used, the start or landing must be made from a point within 50 miles of New York, and the start or landing may be from or on any point on the coast of France. The time will be taken from the moment of leaving the selected starting place, in the case of land machines. In the case of starts made from the water, the time of start and finish will be taken from the moment of leaving or reaching land or crossing the coast line. In each case the pilot must report in person immediately to the Aero Club of America or the Aero Club of France.

All starts must be made under the supervision of an official or officials appointed by the Aero Club of America.

Identification of Aircraft.—Only one aircraft may be used for each attempt. It may be repaired en route. It will be so marked before starting that it can be identified on reaching the other side.

THE ROYAL AERO CLUB GOLF MEETING.

Lieut.-Colonel J. T. C. Moore-Brabazon (scratch) won the medal competition, at the Royal Aero Club's meeting at Addington, Surrey, on November 18th, with a score of 82. In the afternoon Colonel Brabazon tied with Mr. F. Mead (handicap 2) at 4 down in the bogey competition.

The scores in the medal competition were :—Lieut.-Colonel J. T. C. Moore-Brabazon (scratch), 82; Mr. F Mead, 88 minus 2 equals 86; Mr. P. Stanley May, 86 plus 1 equals 87; Mr. E. B. Parker, 99 minus 10 equals 89; Mr. H. G. Burford, 101 minus 10 equals 91; Major S. V Sippe, 110 minus 18 equals 92.

The scores in the bogey competition were :—Lieut.-Colonel J. T. C. Moore-Brabazon (scratch), 4 down; Mr. F. Mead (handicap 2), 4 down; Mr. P. Stanley May (plus 1), 5 down; Mr. E. B. Parker (10), 6 down; Mr. S. Goodchild (9), 6 down.

AIRCRAFT IN PARLIAMENT

HOUSE OF COMMONS.

The following written answers were given on November 17th :—

AIRMEN UNDER SENTENCE.

Mr. LUNN asked the Under-Secretary of State to the Air Ministry what is the number of men of all ranks now serving sentences of more than three months' duration for military offences.

Mr. CHURCHILL: The number of airmen serving sentences of more than three months' duration for Air Force offences is twenty-eight.

TRANSPORT OFFICERS.

Mr. RAPER asked the Under-Secretary of State to the Air Ministry whether he is aware that the civil aviation transport officers have far more responsibility than officers holding a corresponding rank in the Royal Air Force; and why the Royal Air Force officers of equivalent rank receive considerably higher pay, free medical attention, and qualify for pensions.

Mr. CHURCHILL: In reply to my hon. friend's question, it is recognised that civil aviation transport officers have considerable responsibility, but not necessarily more than that of officers holding a corresponding rank in the Royal Air Force. Further than this, civil aviation transport officers do not have the additional risk incurred in flying and have not executive command of a fighting or other Service unit. I may add that the rates of pay have been under revision, and revised rates on an increased scale have recently been sanctioned by the Treasury.

Mr. RAPER asked the Under-Secretary of State to the Air Ministry whether the civil aviation transport officers' agreements are for six months only and terminable at one month's notice on either side.

Mr. CHURCHILL: The reply to my hon. friend's question is that civil aviation transport officers are appointed for six months, and that their agreements are terminable on three months' notice on either side thereafter.

Mr. RAPER asked the Under-Secretary of State to the Air Ministry whether it is laid down that only ex-pilots and ex-observers shall be eligible for appointments as civil aviation transport officers.

Mr. CHURCHILL: While it is the general intention to appoint ex-pilots and ex-observers as civil aviation transport officers, it is not intended that this ruling should be absolutely binding, as this might eliminate exceptionally suitable candidates who may not have had practical experience of flying.

HOUNSLOW AERODROME.

Mr. RAPER asked the Under-Secretary of State to the Air Ministry whether there is any intention of discontinuing the use of Hounslow Aerodrome as a control aerodrome.

Mr. CHURCHILL: I cannot make a statement with regard to the future of Hounslow Aerodrome at present. The question is now under consideration.

MARRIED OFFICERS (ALLOWANCES).

Mr. T. THOMSON asked the Under-Secretary of State to the Air Ministry whether he is aware that the regulations governing the issue of lodging and fuel allowances to married officers are not the same in the Air Force as in the Army, and that in the former case a married officer under the rank of major who was under thirty years of age when the present regulations came into force is treated less favourably than an officer serving under similar conditions in the Army; and, if so, is he prepared to reconsider the matter with a view to putting officers of both branches of the Service on the same footing.

Mr. CHURCHILL: The scheme of emoluments for the Royal Air Force must be taken as a whole, and a comparison of particular items with particular items in the arrangements of other Services is misleading. There are, however, points of difference in the system of allowances which are now being considered, one of these being the question whether all officers married at the date of the order may draw lodging allowance irrespective of age.

TRAINING, FARNBOROUGH

Viscount WOLMER asked the Under-Secretary of State to the Air Ministry whether civilians are still being trained as pilots at the Royal Aircraft establishment, Farnborough, while certificated pilots are at present willing to fly and are not allowed to do so.

Mr. KELLAWAY: I have been asked to answer this question. A certain number of civilians are employed at the Royal Aircraft Establishment on special research work. In order to obtain the fullest advantage from their work it is necessary that some of them, at any rate, shall actually take up and fly machines themselves. At the present time one civilian is so employed and three more are under training. Apart from this special work, all flying tests or experiments are carried out by R.A.F. pilots.

* * *

The following oral answers were given on November 18th :—

FLYING BOATS.

Lieut.-Col. BURGOYNE asked the Under Secretary of State to the Air Ministry whether it is proposed to encourage the development of flying boats as distinct from seaplanes; and, if so, what steps have been taken towards such encouragement?

Capt. GUEST (Joint Parliamentary Secretary to the Treasury): The reply to the first part of my hon. and gallant friend's question is in the affirmative; and to the second part that three different types of experimental boat seaplanes are on order and that, as already announced, one of the prizes in the British Aircraft Competition for 1920 is for a boat or float seaplane.

Mr. BILLING: Have the Admiralty been consulted as to the possible requirements of these seaplanes, or are experiments conducted without the co-operation of the Admiralty?

Capt. GUEST: I understand that the Admiralty have not been consulted.

Mr. BILLING: Having regard to the fact that all flying boats are essentially operative with the Navy, will he see that they are consulted?

Capt. GUEST: I will refer to the Secretary of State.

CIVIL AVIATION.

Lieut.-Col. BURGOYNE asked the Under Secretary of State to the Air Ministry what competitions have been organised by the Government for the development of civil aviation; do these competitions pay regard to the possible military value of the designs to be entered; and does he consider that it is possible in the future development of flying to combine the dual functions of both war and peace with practicability?

Capt. GUEST: The reply to the first part of my hon. and gallant friend's question is that three competitions are being organised for the year 1920. They are to be open to small aeroplanes, large aeroplanes, and seaplanes, respectively, the seaplane competition being framed with the object of developing a type of aircraft capable of alighting on and rising from land as well as water. The total prizes amount to £64,000. It is also under consideration whether, in addition to these, at a later date, a fourth competition should be organised for a large type of flying boat not required to possess amphibious qualities.

The reply to the second part of the question is that the above competitions are designed with a view to the attainment of safety and comfort of air travel. It is expected that a number of valuable lessons will be learned as the result of them, and many of these will undoubtedly be of great use from a military point of view. Where, however, military requirements diverge from safety requirements, the latter will be given the preference.

In regard to the third part of the question, it seems probable that the designs of civil and military aircraft will diverge as time goes on. But, whatever class of aircraft is experimented with, certain improvements are sought for; those may be in regard to aerodynamic qualities, method of construction, reliability of engines or petrol installation, etc., and the knowledge thus gained can be used equally in designing new civil or military aircraft.

* * *

The following oral answer was given on November 19th :—

ROYAL AIR FORCE CAMPS, SHROPSHIRE.

Capt. Sir B. STANIER asked the Secretary of State for War whether it has yet been settled which of the four camps used during the War by the Air Force in Shropshire are to be kept as permanent camps and which are to be dismantled?

Capt. GUEST (Joint Parliamentary Secretary to the Treasury): It is assumed that Shrewsbury, at which there is an Aircraft Acceptance Park, and a Mechanical Transport Repair Depot, but no aerodrome, Shawbury and Ternhill are the four camps referred to. Owing to the unavoidable delay in deciding the future size of the Royal Air Force, it has not been possible to settle the fate of many stations. It is, however, possible to say that either Shawbury or Ternhill will shortly be relinquished, and that in all probability the Mechanical Transport Repair Depot at Shrewsbury will be kept, while the Aircraft Acceptance Park will be disbanded. Decisions on all these points will very shortly be reached.

* * *

The following written answer was given on November 19th :—

POST OFFICE.—CONTINENTAL AIR RAIDS [*sic*]

Mr. GWYNNE asked the Postmaster-General what is the present charge to the public per letter for delivering mails to the Continent by air, in addition to the postal fees; what is the similar charge made by France and Germany for air mails outside their country; what charges are made by the transport company to the Post Office; and what profit the Post Office makes on these transactions per letter.

Mr. PEASE: A special fee of 2s. 6d. per ounce in addition to the ordinary foreign postage is charged on correspondence accepted for transmission by the Air Mail Service from London to Paris. The special fee charge by the French Post Office in the reverse direction is 3 francs per 20 grammes. I am unable to state the charges levied in Germany for any similar service. Payment is made to the British company performing the London to Paris service at the rate of 2s. per ounce; and the remainder of the fee is intended to cover the cost of the special treatment of the correspondence and its express delivery.

* * *

The following oral answer was given on November 20th :—

ROYAL AIR FORCE.

Lord HUGH CECIL (by private notice) asked the Prime Minister whether his attention has been called to the anxiety expressed by some Members of the House in regard to the relation between the War Office and the Air Office now existing, and the consequent effects upon the Royal Air Force; whether the Government will make a full statement of their policy in regard to the Air Ministry and the Royal Air Force; and whether they will fix a day for a full discussion of that policy.

The PRIME MINISTER: My attention has been called to a resolution to that effect carried at a meeting of Members of this House. There has been no change whatever in the policy of the Government in regard to the Air Force, and I see no need for any discussion at present. If, however, there should be any general desire for such a discussion, my right hon. friend will, I am sure, try to arrange it, but the pressure of business is so great that it will be difficult to find time.

A CHILEAN MISSION.

One understands that the Special Mission from the Chilean Government, which is at present visiting this country in return for the visit paid to South America by the British Mission under Sir Maurice de Bunsen, will, in addition to its numerous engagements, visit the Elswick works and shipbuilding yards of Sir W. G. Armstrong, Whitworth and Co., Ltd., at Newcastle-on-Tyne, on Nov. 14th.

Special interest attaches to the visit in view of the fact that during recent years this firm has had very close associations with the Chilean Government and has undertaken large contracts in connection with additions to the Chilean Navy.

An immense amount of English capital is invested in Chili, and this visit will draw still closer the commercial trade relations between this country and Chili.

THE TURNHOUSE AERODROME.

At a recent meeting of the Lord Provost's Committee of the Town Council of Edinburgh, a letter from the Air Ministry was read. It stated that the Air Council were now compelled to dispose of Turnhouse aerodrome and that if the Corporation desired to consider the acquisition of the aerodrome and buildings they should communicate with the Director-General of Lands. The city appear to be willing to take control of Turnhouse aerodrome, but do not want to be saddled with the entire financial responsibility, which, they think, is a matter for the Government.

WAR OFFICE, Nov. 17th.

TERRITORIAL FORCE.—INFANTRY.—8th Bn., Middx. R.—Sec. Lt. L. D. Wright to be Lt., and to remain secd. (R.A.F.), July 1st, 1917.

WAR OFFICE, Nov. 18th.

REGULAR FORCES.—ESTABLISHMENTS.—R.F.C.—Mil. Wing.—The notification in the "Gazette" of Aug. 20th, 1917, regarding temp. Lt. and Hon. Capt. C. A. Hooper, Spec. Res., is cancelled.

Special Appt. (graded as a Park Comdr.):—Temp. Lt. and Hon. Capt. C. A. Hooper, Spec. Res., and to be temp. Maj. whilst so empld., July 2nd, 1917.

MEMORANDUM.—Sec. Lt. A. Ward (attd. R.A.F.) retires, receiving a gratuity, Nov. 19th.

WAR OFFICE, Nov. 19th.

REGULAR FORCES.—INFANTRY.—SERVICE BATTALIONS.—R. W. Fus.—Temp. Sec. Lt. J. W. Kemberry resigns his commn. on appt. to R.A.F., Nov. 9th, 1918.

WAR OFFICE, Nov. 21st.

REGULAR FORCES.—INFANTRY.—SERVICE BATTALIONS.—S. Wales Bord.—Temp. Sec. Lt. W. A. Wright, from R.A.F., to be temp. Sec. Lt., March 3rd, 1918.

MEMORANDUM.—Lt. L. E. Taylor, M.B.E. (attd. R.A.F.), retires, receiving a gratuity, Nov. 22nd.

OVERSEA FORCES.—CANADA.—C.A.S.C.—Temp. Capt. V. H. Huston, M.C., ceases to be secd. to the Royal Air Force for duty, Sept. 30th.

TERRITORIAL FORCES.—YEOMANRY.—R. N. Devon.—Lt. A. R. Churchman, D.F.C., relinquishes his commn. in the T.F. on appt. to a permanent commn. in R.A.F., Aug. 1st, and retains rank of Lt.

Hamps.—Capt. R. A. Cooper, D.S.O., relinquishes his commn. in the T.F. on appt. to a permanent commn. in R.A.F., Aug. 1st, and retains rank of Capt.

Lincolnshire.—Lt. C. S. Porri relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F., Aug. 1st, and retains the rank of Lt.

2nd County of Lond.—Lt. S. P. Marcus relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F., Aug. 1st, and retains the rank of Lt.

1st Lovat's Scouts.—Capt. G. J. C. Maxwell, M.C., A.F.C., relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F., Aug. 1st, and retains the rank of Capt.

Notts (Sherwd. Rgrs.).—Lt. D. F. Stevenson, D.S.O., M.C., relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F., Aug. 1st, and retains the rank of Lt.

Shropshire.—Capt. W. G. P. Young, O.B.E., relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F., Aug. 1st, and retains the rank of Capt.

North Somerset.—Maj. J. H. S. Tyssen, M.C., relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F., Aug. 1st, and retains the rank of Maj.

Surrey.—Capt. J. Everidge, M.C., relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F., Aug. 1st, and retains the rank of Capt.

ROYAL ENGINEERS.—Field Cos.—Capt. (Brev. Maj.) A. Cleghorn, High. Divl. Engrs., relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F., Aug. 1st, and retains his rank; Lt. F. H. Ronksley, M.C., W. Rid. Divl. Engrs., relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F., Aug. 1st, and retains the rank of Lt.

Signal Cos.—Capt. A. ap Ellis, W. Rid. Divl. Engrs., relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F., Aug. 1st, and retains the rank of Capt.

WAR OFFICE, Nov. 22nd.

REGULAR FORCES.—MEMORANDA.—Col. E. B. Ashmore, C.B., C.M.G., M.V.O., relinquishes the temp. rank of Maj.-Gen., and retains his appt. as Comdr., London Air Defence Area (Oct. 31st).

TERRITORIAL FORCE.—ROYAL HORSE AND ROYAL FIELD ARTILLERY.—Maj. S. Smith, D.S.O., A.F.C., 3rd E. Anglian Bde., relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F. (Aug. 1st) and retains the rank of Maj.

Capt. C. C. Durston, "A" Bty., H.A.C., relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F. (Aug. 1st) and retains the rank of Capt.

Lt. G. Henderson, 3rd E. Lancs Bde., relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F. (Aug. 1st) and retains the rank of Lt.

Lt. R. S. McClintock, M.C., 3rd W. Lancs Bde., relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F. (Aug. 1st) and retains the rank of Lt.

Lt. J. L. Vachell, M.C., 4th Welsh Bde., relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F. (Aug. 1st) and retains the rank of Lt.

Lt. C. M. Eastley, 4th Wessex Bde., relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F. (Aug. 1st) and retains the rank of Lt.

Lt. H. M. Coombs, D.F.C., 2nd Wessex Bde., relinquishes his commn. in the T.F. on appt. to a permanent commn. in the R.A.F. (Aug. 1st) and retains the rank of Lt.

AIR FORCE.

AIR MINISTRY, Nov. 18th.

The King has approved of the following rewards, conferred by the General Officer Commanding the North Russian Expeditionary Force:

DISTINGUISHED SERVICE ORDER.

Sqdn. Leader (A./Wing Comdr.) ROBIN GREY (Gren. Gds.).—Commanded the R.A.F., Archangel Area, with great distinction. Owing to the lack of pilots and observers during the winter, he carried out personally the most dangerous reconnaissances. On April 8th, 1919, at Obozerskaya, he carried out a reconnaissance in bad weather, bringing back valuable information. On April 22nd he carried out two most important reconnaissances with success, but met with a bad accident on landing the second time. Although considerably shaken physically, he continued to command the R.A.F. with marked success until the conclusion of the operations in North Russia.

Flight Lt. NORMAN GORDON STEWART-DAWSON, D.S.C.—Successfully led several raids with great success during the operations with the "Syren" Force in North Russia from June to September, 1919, notably in the attack on the enemy at Koikori on September 7th. Flight Lt. Stewart-Dawson has displayed exceptionally good qualities in leadership during these operations in the air, and equally distinguished services in ground-work organisation, where the difficulties were many.

BAR TO THE DISTINGUISHED FLYING CROSS.

Observer Officer PARCELL REES BOWEN, M.C., D.F.C. (5th Welsh R.).—On Aug. 24th, 1919, whilst observer on reconnaissance over the enemy aerodrome (Toima), he was fired upon at long-distance range from an enemy machine, both himself and the pilot being wounded. The pilot having collapsed from his wound onto the controls, Observer Officer Bowen managed to guide the machine from the back seat and flew homeward for a distance of 100 miles, by which time the pilot had slightly recovered and took control of the landing, which was safely made on the Bereznik Aerodrome. This officer's action was highly meritorious, and the guiding of the machine over a long distance was especially noteworthy in view of the wound which he had sustained in the right elbow.

Flying Officer JOHN SHARPE GRIFFITH, D.F.C.—Between May 5th and July 24th, 1919, this officer carried out 40 bomb raids and reconnaissances, all with great success and generally from a low altitude. On June 3rd, 1919, he dived to within 100 ft. of the ground and destroyed an enemy balloon, as well as several of its attendants. When a two-seater machine was not readily available he fitted a camera to his scout and, although it is very difficult to take photographs from such machines (and, moreover, he was inexperienced in such work), he succeeded in taking a very good mosaic which proved of great utility to the Commander of the Vologda Force. Flying Officer Griffith is an intrepid pilot and a very skilful all-round officer.

Flying Officer (A./Flt. Lt.) FREDERICK IVES LORD, D.F.C.—On June 27th, 1919, whilst piloting an R.E.8 machine, he found the position of the enemy on the Pinega River, four versts from Pilegori, and attacked the moving columns from a height of 200 ft. with such effect that their transport was stampeded and their expected attack broke down, without any casualties being sustained by our forces.

DISTINGUISHED FLYING CROSS.

Flying Officer CYRIL ARTHUR BOUCHIER.—A very skilful pilot of marked initiative and courage. Has been brought to notice on many occasions for the determination shown in his attacks. His methods are somewhat original. By flying low, parallel with and behind the enemy's lines, stampeding convoys and destroying wagons, he has caused the greatest confusion amongst the enemy, to the great advantage of our own forces. Flying Officer Bouchier is a highly competent reconnaissance officer.

Flight Lt. OLIVER CAMPBELL BRYSON, M.C., A.M. (Dor. Yeo.).—Has commanded a squadron of heavy bombing machines in North Russia during the whole of the summer of 1919, during which period he carried out a large number of successful raids on the enemy's territory. During the operations on the Dwina in August, and on the Pinega in September, 1919, he flew a Snipe machine with excellent skill and daring. A very gallant officer he has proved himself during these exceptionally difficult aerial operations.

Flight Lt. (A./Sqdn. Ldr.) CHARLES RODERICK CARR.—On June 17th, 1919, this officer flew a scout machine over the enemy aerodrome at Puchega, at an average height of only 50 ft., for 30 min. During this time he succeeded in setting fire to a Nieuport enemy machine, to a hangar which contained three aeroplanes (all of which were destroyed), drove all the personnel off the aerodrome, and killed some of the mechanics.

Observer Officer FREDERICK TALBOT EADES.—On June 9th, 1919, whilst serving with the "Syren" Force in North Russia, this officer was on night patrol (observer) in heavy rain, investigating the enemy's position off Schunga, on Lake Onega. Their position was attacked from a height of 300 ft. by machine-guns and bombs, the latter being thrown from the observer's cockpit. Having expended all ammunition, the machine returned to base, and after refilling again attacked and drove one gunboat ashore. A second gunboat was later seen to be in tow, presumably damaged in the attack. On the night of June 11th this officer was observer in the seaplane piloted by Flying Officer Isaac, when the enemy's line was twice cut, the machine sustaining considerable damage in the second attack.

Flying Officer HAROLD ALFRED HAINES.—During June and July, 1919, this officer performed numerous acts of gallantry in the operations of the "Syren" Force, North Russia. His work has been characterised by care and judgment, coupled with a total disregard of personal danger. He has taken part in numerous actions against the enemy from a very low altitude, and consequently at great risk, which resulted in the infliction of heavy casualties and great damage being done to the enemy's rolling-stock, ships, and bridges.

Pilot Officer BERNARD ALLEN HEENEY.—During the entire winter in North Russia this observer officer flew almost continuously over the enemy's lines on reconnaissance duties, under very arduous and dangerous circumstances. Pilot Officer Heeney was severely wounded on June 20th, 1919, whilst flying very low, assisting our Allied troops.

Flying Officer FREDERICK HARRY ISAAC.—On June 11th, 1919, whilst serving with the "Syren" Force in North Russia, this pilot was on patrol endeavouring to prevent reinforcements from reaching the enemy's front; he descended to within 50 ft. of the ground and, whilst exposed to heavy fire, succeeded in cutting their line with bombs. During the night the enemy repaired the line, and Pilot Isaac on hearing of this proceeded to the scene and again destroyed it from a height of only 30 ft., his machine sustaining heavy damage from the enemy's fire, as well as from his own bombs. The gallantry and determination of this officer will be more readily appreciated when it is borne in mind that his machine was a seaplane, operating seven miles inland.

Flying Officer ARTHUR EDWARD LETTINGTON.—During the operations of the "Syren" Force in North Russia, from July to September, 1919, this pilot has proved himself a gallant officer with marked ability and initiative. In machine-gunning the enemy from very low altitudes he has met with signal success. On August 3rd, 1919, in co-operation with our Lake Flotilla off Tolvuya, he descended and attacked the enemy quite near the water in the face of concentrated machine-gun fire, which resulted in the capture of the town and three of the enemy's steamers. Many other instances are recorded wherein this officer displayed gallantry of a high order in circumstances of great difficulty.

Flying Officer LLOYD WESLEY MASON.—This officer has shown great dash and courage whilst flying a Snipe at extremely low altitudes. He has taken part in operations throughout the summer both on the Dwina and Railway Fronts, and has attacked many targets with his machine-guns, dispersing troops and breaking up counter-attacks. In an attack on Puchega Aerodrome he descended very near the ground

The highest grade spirit is essential to the aeroplane engine

ELECTRICAL ENGINEERS & CABLE MAKERS

J

Jottings

Only by maximum production will British Commerce regain its long enjoyed ascendancy.

It follows that in every sphere of manufacture all directing Heads are assiduously searching every channel where assistance in the fulfilment of this purpose is likely to be found.

The application of electricity to their own peculiar needs is one means of progress which they must not fail to carefully examine,

And in this connection our experience as manufacturers of Electric Cables and Plant, and the fact that we have specialised in the transmission, distribution and application of this form of power to the many varying requirements of the Industrial World, should materially help.

That experience is placed unreservedly at the disposal of our customers.

You should write and state your case.

JOHNSON & PHILLIPS, Ltd.

Electrical Engineers & Cable Makers since '75

CHARLTON, LONDON, S.E.7.

City Office: 12 Union Court, Old Broad St., E.C.2.

in an endeavour to silence machine-guns which were concentrating on his Squadron Commander's machine.

Flight Lt. ALFRED PRICE MAURICE.—Commanded the R.A.F. Unit at Obozerskaya since May 5th, 1919, with marked success, proving himself a most capable and reliable officer, adapting himself readily to the unusual and often unfavourable conditions. Flight Lt. Maurice has constantly carried out reconnaissances over the enemy's lines in dangerous circumstances, and has conducted bomb raids from low levels, notwithstanding the strong opposition from the enemy's anti-aircraft guns and machine-guns.

Flying Officer JOHN PERCIVAL MORKAM (Northants R.).—For more than six months, including the coldest and most inclement portion of the Arctic winter, this officer has displayed marked qualities of good leadership. In May, 1919, great efforts were made to prepare a forward summer aerodrome, but not with much success, and owing to the unsuitability of the available machines all attempts to rise from it failed—in one of these attempts at rising Flying Officer Morkam's machine was smashed and he himself severely injured. Notwithstanding these difficulties this officer, under urgent necessity, voluntarily undertook a reconnaissance flight of three hours over unknown and unmapped country, and returned with very valuable information, his petrol being absolutely exhausted on alighting. The nature of the country is such that no landing was possible anywhere on the return journey until his own base was reached. ("Syren" Force, North Russia.)

Flight Lt. WALTER HENRY PARK, M.C.—An exceptionally good pilot who has displayed marked ability and courage during the operations with the "Syren" Force in North Russia. His service flights have been specially praised on six occasions by the Commander of the Force during a period of three months, and his determination in pressing home the attacks on the enemy contributed in a large measure to the success which attended the work of the Air Force.

Observer Officer EDWARD ERIC SPENCER WHEATLEY (R.A.).—Has rendered valuable services in artillery observation from low altitudes, having been mentioned several times for this work. During the operations on the Dwina in June, 1919, he carried out many contact patrols, flying very low over the heads of the enemy, keeping our headquarters constantly and accurately informed as to the position.

DISTINGUISHED FLYING MEDAL.

No. 207177 Sjt. CHARLES VICTOR ROBINSON, late 205th Squadron, R.A.F. (France).—On May 18th, 1918, whilst acting as observer in a bombing attack on Chaulnes Railway Junction, his formation was attacked by seven enemy scouts. His machine was attacked simultaneously by two of these, one of which he shot down in flames. On the pervious day he dropped a 112-lb. bomb on this junction, causing a great conflagration. Sjt. Robinson has carried out 100 successful bombing raids, and is a most reliable observer.

FOREIGN DECORATIONS

The King has granted unrestricted permission for the wearing of the following decorations conferred for valuable services rendered in connection with the war:—

CONFERRED BY THE PRESIDENT OF THE FRENCH REPUBLIC.

Croix de Commandeur, Legion d'Honneur.—Maj.-Gen. Sir Frederick Hugh Sykes, G.B.E., K.C.B., C.M.G. (Retd. List).

Croix de Guerre, avec Palme.—Flying Officer Arthur Rowan (Salonika), Flight Lt. Charles Ernest Sherwin, M.C. (R.E., T.F.) (Aden).

CONFERRED BY THE PRESIDENT OF THE PORTUGUESE REPUBLIC.

Chevalier, Military Order of Avis.—Capt. Bernard Purvis Broackes Carter, D.F.C. (France)

CONFERRED BY THE KING OF ROUMANIA.

Chevalier, Order of the Crown.—Sec. Lt. George Ercole, late R.A.F.

CONFERRED BY THE SULTAN OF EGYPT.

Order of the Nile, 3rd Class.—Wing Comdr. Charles Stuart Burnett, C.B.E., D.S.O. (H.L.I.); Wing Comdr. Norman Goldsmith, O.B.E. (R.A.); Sqdn. Leader Eric Lewis Conran, M.C. (21st Lcrs.); Maj. (T./Lt.-Col.) Robert Hall, O.B.E. (Capt., R.W. Fus.).

Order of the Nile, 4th Class.—Capt. Albert John Gordon Anderson (Lond. R.); Capt. Lionel Mundy Bailey, A.F.C.; Flying Officer Robert Charles Jenkins, M.C. (D.C.L.I.); Sqdn. Leader Charles Henry Nicholas, A.F.C. (S.W. Bordrs.); Flying Officer David Norrie Thomson, M.C. (Glas. Yeo.).

MILITARY MEDAL.

The King has approved of the award of the Military Medal for bravery in the field to No. 26712 Flight Sjt. Edward Wardell (Putney), R.A.F., for gallantry in numerous actions extending from June, 1917, to the close of the war.

AIR MINISTRY, Nov. 18th.

R.A.F.—Flying Officer J. Edelsten is granted a permanent commn. (A.), Aug. 1st.

The following temp. appt. is made:—Staff Officer, 3rd Class.—(P). Flight Lt. D F. Massy, Sept. 1st (substituted for notification in "Gazette" of Oct. 10th, wherein this officer's initials were shown as "D. P.").

FLYING BRANCH.—The following Lts. are graded for pay and allowances as Capts. whilst empld. as Capts. (A.):—W. Henderson to May 16th; (Hon. Capt.) I. G. Roberts to Sept 6th, May 1st.

Sec. Lt. F. Thomasson, D.F.C., to be Lt., Feb. 24th.

Pilot Officer E. A. Siegrist to be Flying Officer, Sept. 10th.

Pilot Officer T. Q. Harvey relinquishes the grading for pay and allowances as Flying Officer on ceasing to be empld. as Flying Officer (O.), Oct. 21st.

Flight Cadet H. H. Bracher is granted a temp. commn. as Sec. Lt. (O.), Aug. 8th, 1918 (since killed).

The following relinquish their commns. on ceasing to be empld.:—Sec. Lt. (Hon. Lt.) P. R. Cook, July 8th, 1918 (substituted for notification in "Gazette" of Aug. 5th); Maj H. Wyllie, O.B.E. (Capt., Wilts. R.), Capt. C. R. Robbins, M.C., D.F.C. (Lt., R.F.A.), Oct. 31st; Lt. H. J. Bullock (Lt., Norf. R.), Nov. 5th; Lt. (Hon. Capt.) R. E. Wilson (Capt., Hamps. R.), Nov. 6th; Sec. Lt. (Hon. Lt.) A. Cox (Lt., R. Welsh Fus.), Nov. 8th

Transferred to unempld. list:—Lt. (Hon. Capt.) H. A. Henry, Jan. 15th; Sec. Lt. C. G. Ball, Sec. Lt E. K. Blair, Sec. Lt. C. R. Card, Sec. Lt. E. A. Locking, Sec Lt D. A. McCuaig, Sec. Lt. R. C. MacKinnon, Sec. Lt. J. C. McLachlan, Sec. Lt. R. J. Payne, Sec. Lt. G. C. Phillips, Sec. Lt. H. A. Phinney, Sec. Lt. G. L. Reid, Sec. Lt. C. W. Riley, Sec. Lt. W. J. Sturgeon, Feb. 1st; Lt. E. A. Newton, Feb. 17th; Lt. W. A. Bartlett, Feb. 24th; Sec. Lt. H. I. Terry, Feb. 28th; Capt. T. C. Trumble, March 1st; Lt. H. R. Casgrain, March 6th; Capt. C. T. Latch, March 9th; Lt. C. J. W. McKeown, March 16th; Sec. Lt. R. E. F. Tivy, March 22nd; Lt. C. I. Van-Nostrand, April 3rd; Capt. R. A. Logan, April 7th; Sec. Lt. J. O. Bach, April 8th; Lt. E. J. A. Burke, Lt G. B. Wigle, Sec. Lt. W. J. Wigmore, April 13th; Sec. Lt. C. Cutler, April 17th; Sec. Lt. (Hon. Lt.) R. L. Cobham, April 19th; Sec. Lt. A. T. Wood, April 23rd; Capt. R. W. Buswell, April 30th; Sec. Lt. M. McIsaac, May 1st; Lt. S. Hill, May 2nd; Sec. Lt. P. V. Bedore, May 8th; Lt. W. W. Vick, May 10th; Lt. L. F. Williams, May 20th; Sec. Lt. F. G. H. Bar, June 16th; Lt. F. D. Slee, June 23rd; Sec. Lt. J. W. M. Proubert, June 27th (substituted for notification in the "Gazette" of July 4th); Sec. Lt. R. B. Wiggins, July 10th; Sec. Lt. F. Whiskin, July 11th; Sec. Lt. E. Wells, July 12th; Sec. Lt. S. L. Walters, July 25th; Lt. R. D. C. Blake, D.F.C., Aug. 12th; Lt. E. Blythe, Aug. 14th; Lt. R. de R. Brett, M.C., Aug. 25th; Sec. Lt. W. F. McCunn, Sept. 3rd; Lt. E. R. Danks, Sept. 7th; Lt. D. H. Batty, Lt. T. P. Fox, Sept. 9th; Lt. A. E. Chittenden, D.F.C., Sept. 10th; Lt. D. E. P. Chaplin, Sec. Lt. G. Graham, Sept. 11th; Sec. Lt. H. S. Cook, Lt. G. W. F. Darvill, D.F.C., Sept. 12th; Sec. Lt. W. H. Boite, Sec. Lt. S. G. Burgess, Lt. W. J. P. Jenner, D.F.C., Sept. 13th; Sec. Lt. J. H. Gray, Sept. 20th; Lt. G. H. Langley, Sept. 24th; Lt. H. S. Fey, Sept. 26th; Lt. T Capps, Lt. F. Pooley, Sept. 27th; Sec. Lt. F. C. Annett, Sec. Lt. E. J. Edwards, Sec. Lt. E. V. Finland, Sec. Lt. H. R. Waddell, Sec. Lt. C. O. White, Sec. Lt. R. E. Williams, Sept. 28th; Sec. Lt. C. T. Ward, Sec. Lt. J. Weeding, Sept. 29th; Sec. Lt. H. W. Featherstonehaugh, Oct. 6th; Sec. Lt. J. Collins, Capt. R. C. Davies, Oct. 10th; Sec. Lt. J. D. Shotter, A.F.C., Lt. W. W. White, Oct 22nd; Lt. W. T. Edwards, Capt. D. M. Tidmarsh, M.C., Oct. 28th; Lt. R. B T. Hedges, Oct. 30th; Lt. A. M. Ross, Oct. 31st; Lt. R. K. Muir, Nov. 1st; Sec. Lt. R. S Winter, Nov. 2nd; Lt. J. A. W. Armstrong, Lt. F. R. Keen, Capt. A. N. Kingwill, Sec. Lt. W. E. Osterburg, Capt. E. Selby, O.B.E., Lt. J. Spencer, Nov. 3rd; Sec. Lt. (Hon Lt.) W. A. S. Blucke, Capt. W. P. McDuff Brettell, Sec. Lt. H. S. R. Burt, Lt. B. Hackforth, Lt. B. A. Hewett, Maj. E. E Hodgson, Lt. E. W. Horncastle, Lt. E. C. K. Kingston, Sec. Lt. A. Maybaum, Lt. H. F. Potter, Sec. Lt. (Hon. Lt.) C. W. Saggs, Lt. J. G. Simpson, Sec. Lt. J. M. Walmsley, Lt. J. C. Williamson, Lt. T. W. Williamson, Lt. E. B. Wilson, Lt. C. C. Woodall, Nov. 4th; Lt. G. G. L. Blake, D.F.C., D.C.M., Capt. P. L. Bryant, Lt. B. B. Caswell, Sec. Lt. G. P. W. Chandler, Lt. M. B. Lewis, Lt. W. A. McCulloch, Sec. Lt. J. J. W. Nelmes, Lt. (actg. Capt.) W. R. Phillips, D.F.C., Lt. K. MacP. Smith, Sec. Lt. W. T. K. Wallington, Lt. S. Wilkinson, A.F.C., Nov. 5th; Sec. Lt. A. Findley, Nov. 6th; Capt. M. Faux, Lt. L. W. R. Grubb, Sec. Lt. E. G. Marchant, Lt. F. R S. Southon, Lt. P. E. Wood, Nov. 7th; Lt. A. R. Clark, Nov. 9th; Sec. Lt. B. Lones, Lt. J. W. Webb, Nov. 11th; Sec. Lt. J. E. Foden, Lt. J. G. Horne, Lt. A. J. R. F. Johnson, Nov. 14th; Lt. S. W. Walker, Nov. 16th.

The following Lts. relinquish their commns. on account of ill-health, and are permitted to retain their rank:—P. J. Casey (caused by wounds), Nov. 10th; W. A. Horan (Lt., S. African F.A.) (caused by wounds), Nov. 14th; H. E Hyde (contracted on active service), Nov. 16th.

The following Sec. Lts. relinquish their commns. on account of ill-health contracted on active service, and are permitted to retain their rank:—G. R. Newton-Bridle, July 25th (substituted for notification in "Gazette," Aug. 1st); H. Frew, Nov. 6th; V. M. Mitchell, Nov. 12th.

Sec. Lt. C. F. Lawson is antedated in his appt. as Sec. Lt. (O.), July 29th, 1918.

The notification in "Gazette" of Nov. 11th concerning Lt.-Col. G. C. St. P. De Dombasle is cancelled.

The notification in "Gazette" of Oct. 3rd concerning Sec. Lt. J. A. Peterson is cancelled.

The notification in "Gazette" of Oct. 28th concerning Sec. Lt. L. E. G. Judge is cancelled.

The notification in "Gazette" of Aug. 22nd concerning Sec. Lt. H. Toms is cancelled. "Gazette" of Aug. 5th to stand.

ADMINISTRATIVE BRANCH.—Sqdn. Ldr. (actg. Group Capt.) W. P. Alexander to be Sqdn. Ldr. (from Aug. 1st to 31st), and relinquishes the actg. rank of Group Capt.

Maj. R. H. Howell to be Maj., from (S.O.), June 21st, 1918.

Lt. A. E. Burrowes is graded for purposes of pay and allowances as Capt. whilst empld. as Capt., from May 1st to Aug. 9th.

Flight Lt. H. C. Jones relinquishes the grading for pay and allowances of Sqdn. Ldr. on ceasing to be empld. as Sqdn. Ldr., Oct. 14th.

Flight Lt. H. W. M. Paul, O.B.E., M.C., to be Flight Lt., from (S.O.), Oct. 15th.

Lt. (Hon. Maj.) C. A. Cutbill to be Lt. (Hon. Maj.), from (S.O.), Nov. 26th, 1918.

Pilot Officers to be Flying Officers:—J. Earl-Willson, Aug. 17th; F. W. Garley, Oct. 1st.

P.F.O. L. F. Joyner is granted a temp. commn. as Sec. Lt., Sept. 12th, 1918 (substituted for notification in "Gazette" of Sept. 5th).

M. W. Binns is granted a temp. commn. as Sec. Lt., Dec. 7th, 1918.

Lt.-Col. (actg. Col.) A. W. C. McFall, O.B.E. (Lt.-Col., ret., Mil.), relinquishes his commn. on ceasing to be empld., and is permitted to retain the rank of Col., Sept. 18th (substituted for notification in "Gazette" of Oct. 10th).

The following relinquish their commns. on ceasing to be empld.:—Lt. S. J. Stokes, Oct. 30th; Lt. A. H. Bottrell (Lt., R. War. R.), Oct. 31st; Capt. B. G. M. F. Nixon (Capt., Indian Army), Nov. 8th.

Transferred to the unempld. list:—Lt W. Sutherland, Jan. 27th; Sec. Lt. F. J. E. Brake, Feb. 1st; Sec. Lt. R. F Hyett, March 20th; Sec. Lt. L. J. Farley, April 1st; Sec. Lt. R. J. Williams, July 12th; Lt. M. R. Williams, July 23rd; Sec. Lt. W. J. Collins, Aug. 2nd; Lt. R. F. Leather, Sept. 4th; Lt. H. F. G. Findlay, Sept. 29th; Lt. R. B. Fricker, Oct. 9th; Lt. H. Harker, Oct. 10th; Lt. J. J. Wilson, Oct 21st; Capt. W. J. Coombes, Sec. Lt. A. E. C. Halliday, Oct. 22nd; Lt. (Hon. Capt.) A. A. J. Poole, Lt. (Hon. Capt.) H. G. Whyte, Oct. 30th; Sec. Lt. A. Barrett, Sec. Lt. H. S. Harwood, Oct. 31st; Sec. Lt. (actg. Maj.) A. E. H. Hales, Nov. 1st; Lt. E. R. Seymour, Nov. 2nd; Sec. Lt. A. W. Howard, Sec. Lt. I. Powell, Sec. Lt. W. J. Tuckwell, Nov. 3rd; Lt. C. H. Stonham, Capt. E. Watson, Nov. 4th; Lt. H. L. McNaughton, Sec. Lt. (Hon. Lt.) R. E. Shears, Sec. Lt. B. Stone, Sec. Lt. H. C. Wilkin, Nov. 5th; Maj. N. C. Sampson, Nov. 6th; Lt. O. C. George, Nov. 8th; Lt. J. B. Pirie, Nov. 11th; Sec. Lt. R. Bentley, Nov. 14th.

Lt. T. Rumney (R.A.) relinquishes his commn. on account of ill-health contracted on active service, Nov. 7th.

Sec. Lt. B. L. Levi resigns his commn., being physically unsuited for duties of Pilot or Observer, and is permitted to retain his rank, April 4th (substituted for notification in "Gazette," Nov. 8th, 1918).

Transferred to unempld. list, and not "emold. list," as stated in "Gazette," Nov. 7th:—Lt. G. J. Maunsell, Aug. 21st; Sec. Lt. J. H. Norman, Aug. 25th; Capt. C. W. O'Connor, Sept. 1st; Lt. R. G. C. Pinfield, Sept. 3rd; Sec. Lt. A. H. Petch, Sept. 4th; Lt. J. Pell, M.C., Sept. 11th; Capt. A. Pantin, Sept. 12th; Lt. J. Woolfenden, Sept. 15th; Sec. Lt. J. Randall, Sept. 18th; Sec. Lt. S. St. Clare Stone, Sept. 23rd; Lt. A. Mitchell, Oct. 8th; Sec. Lt A. A. Mackay, Oct. 9th; Sec. Lt. D D. Carcary, Lt. G. D. Rowden, Lt. J. L Stewart-Moore, Capt. W. McIvor Watt, M.B.E., Oct. 10th; Lt. J. Sharman, Oct. 11th; Sec. Lt. W. H. Bayley, Sec. Lt. (Hon. Lt.) R. S. Cowen, Lt. A. Lee, M.B.E., Oct. 12th; Maj. E. W. Hugh Kennedy, Oct. 13th; Maj R. D. Carey, O.B.E., Oct. 14th, Lt. (actg Capt.) J. C. Cantrill, Oct. 16th; Capt. E. P. L. Baker, Oct. 20th; Sec. Lt. H H. Watson, Oct. 21st; Lt. W. E J. Roberts, Oct. 22nd; Lt. N. A. Hardie, Lt. J. F. Nalder, Oct. 24th; Lt. (Hon. Capt.) L. F. Bettinson, Lt. P. Dalton, Capt. H. C. Mallett, M.B.E., Oct. 26th; Sec. Lt T. Bathurst, Oct. 27th.

'TRIPLEX'
Unsplinterable
Safety
GLASS

Triplex Safety Glass provides perfect visibility and unequalled strength for all types of windscreens and goggles. It is as clear as ordinary glass, and the heaviest blow cannot make it "fly" or "splinter."

Goggles of all kinds and shapes are now available at prices varying from 25/- to 7/6. Write for our Catalogue No. 2, and our new booklet, and get to know more about it.

The notification in the "Gazette" of Sept. 16th concerning Sec. Lt. T Norman Drake is cancelled. The notification in the "Gazette" of Oct. 28th to stand.

The notifications in the "Gazettes" of May 27th and June 17th concerning Maj. R. H. Howell are cancelled.

The notification in the "Gazette" of Nov. 7th concerning Sec. Lt. C O. D. Kidd is cancelled.

TECHNICAL BRANCH.—Flight Lts. to be Flight Lts., Grade (B), from (S.O.):—Flight Lt. L. Auker, O.B.E., Nov. 1st; (Hon. Sqdn. Ldr.) E. J. Sayer, M.C., Nov. 8th.

The following Lts. are graded for purposes of pay and allowances as Capts. whilst empld. as Capts., Grade (A):—W. F. Floyd, from May 1st to July 31st; C. F. Blunt, July 17th.

Lt. (Hon. Capt.) D. A. English is graded for purposes of pay and allowances as Capt. whilst empld. as Capt., Grade (B), May 1st.

Lt. J. A. Rutherford to be Lt., Grade (B), from (A. and S.), July 1st, 1918 (substituted for notification in the "Gazette" of Aug. 23rd, 1918).

Flying Officers to be Flying Officers, Grade (B), from (S.O.), Nov. 1st:—H. J. Birtles, E. H Eldridge.

Sec. Lt. E. Hague to be Lt., April 19th

Sec. Lt. W. Parkinson to be Lt., Jan. 16th, without the pay and allowances of that rank prior to April 9th.

Sec. Lt. H. W. Nicholl to be Lt., April 19th, without the pay and allowances of that rank prior to May 1st (substituted for notification in the "Gazette" of May 24th).

Pilot Officer J. W. Caddy to be Flying Officer, Oct. 1st.

Sec. Lts. to be actg. Lts. whilst empld. as Lts., Grade (A):—H. H. Weller, May 1st; (Hon. Lt.) D. Sinclair, from May 1st to Oct. 14th.

Pilot Officer A. E. Gliddon to be Flying Officer without the pay and allowances of that rank, Oct. 1st.

Pilot Officer (actg. Sqdn. Ldr.) J. W. Tattersall relinquishes the actg. rank of Sqdn. Ldr. on ceasing to be empld. as Sqdn. Ldr., Grade (A), Oct. 8th.

Sec. Lt. C. H. N. Nunn relinquishes the grading for pay and allowances as Lt., Grade (B), May 13th (substituted for notification in the "Gazette" of Oct. 3rd).

Transferred to the unempld. list:—Sec. Lt. J. M. Blake, Jan. 13th; Lt. C. M. Seth-Ward, May 13th; Lt. A. W. Allan, Sept. 16th; Lt. A. Champion, Sec. Lt. S. E. White, Sept. 19th; Sec. Lt. (Hon. Lt.) H. I. Allen, Sept 26th; Lt. H. G. Welsford, M.B.E., Sept. 29th; Capt. S. H. Bird, Oct. 7th; Lt. H. P. Bramwell, Lt. A. R. Jones, Oct. 10th; Sec. Lt. L. J. Clements, Lt. W. Dawson, M.B.E., Oct. 14th; Capt. K. J. Young, Oct. 23rd; Sec. Lt. (Hon. Lt.) C. M. W. Park, Capt. O. S Stiles, Oct. 30th; Lt. (Hon. Capt.) H. Gardiner, Sec. Lt. R. A. Hornsby, Oct. 31st; Capt. D. P. Geddes, Capt. A. E. Siddons-Wilson, M.B.E., Lt. W. E. Westwood, Nov. 1st; Sec. Lt. (Hon. Lt.) J. J. Galvin, Lt. R. F. Howard, Sec. Lt. U. Jacques, Nov. 3rd; Sec. Lt. K. E. Beswick, Maj. M. K. Cooper-King, Lt. L. A. Mudge, Sec. Lt. S. Maunder, Lt. W. J. Scott, Lt. D. B. Thorp, Nov. 4th; Sec. Lt. (Hon. Lt.) N. A. Grandage, Sec. Lt. R. E. Hardy, Sec. Lt. R. A. Munday, Sec. Lt. J. W. Rodmell, Nov. 5th; Sec. Lt. E. Downer, Sec. Lt. G. W. Webb, Nov. 6th; Lt. J. H. Hill, Sec. Lt. J. W. Watts, Nov. 7th; Sec. Lt. C. B. Brown, Capt. H. E. Horne, Sec. Lt. R. H. B. Tomlinson, Nov. 8th; Sec. Lt. H. O. Keenan, Maj. H. M. Whitley, Nov. 11th.

Lt. H. J. Dolan relinquishes his commn. on account of ill-health contracted on active service, and is permitted to retain his rank, Nov. 7th.

Lt. A. Ward (Sec. Lt., Extra Reg. Empld. List) resigns his commn., Nov. 19th.

The notification in the "Gazette" of Oct. 17th concerning Pilot Officer E. Parrett is cancelled.

MEDICAL BRANCH.—Capt. J. A. Giles to be actg. Maj. whilst empld. as Maj., July 2nd.

Flight Lt. G. Cranstoun to be actg. Sqdn. Ldr. whilst empld. as Sqdn. Ldr., Sept. 4th.

Capt. G. W. Harbottle is transferred to the unempld. list, Nov. 1st.

DENTAL BRANCH.—S. G. Smith is granted a temp. commn. as Lt., July 1st, 1918 (substituted for notification in "London Gazette" of June 28th, 1918, in which he is shown under "Medical" Branch).

MEMORANDA.—The following Prob. Flight Officers are granted hon. commns. as Sec. Lts.:—A. C. Law, Nov. 30th, 1918; J. Cumberbirch, Dec. 10th, 1918; B. M. Bell, Feb. 3rd; E. E. Mays, Feb. 12th; A. W. Brayley, Feb. 14th; G. R. A. Booker, Feb. 18th; J. A. H. Chancellor, Feb. 22nd; W. J Costello, Feb. 27th; L. H. K. Ingham, March 8th; J. H. Allen, W. E. W. Holder, March 14th; W. M. Cowper, March 20th; C. W. Brown, April 8th; G. L. H. Byrne, April 15th; H. V. Glover, April 16th; A. J. Barrett, April 18th.

The following Cadets are granted hon. commns. as Sec. Lts.:—137293 F. S. W. Brice, March 21st; M/6496 R. D. Pollock, March 27th; 69425 W. G. White, April 3rd; 110060 F. N. Carwin, April 20th; 202263 S. J. Burrell, June 20th.

Group Capt. A. M. Longmore, D.S.O., is placed on the half-pay list, Oct. 20th.

The following temp. Hon. Lts. relinquish their commns. on ceasing to be empld.:—T. G. Green, W. E. Pickerill, W. J. Speller, H. T. Woodsmith, Sept. 16th

Transferred to the unempld list:—Lt. W. Watters, from (S.O.), March 14th; Lt. J. A. W. Bourne, from (S.O.), Sept. 12th; Capt. C. A. W. Taylor, from (S.O.), Oct. 7th; Capt. L. P. Ball, O.B.E., from (S.O.), Oct. 31st; Capt. H. G. Wheeler, from (S.O.), Nov. 3rd; Lt. A. G. Stradling, from (S.O.), Nov. 5th.

Lt.-Col. J.-D. Mackworth, C.B.E. (R.W. Surrey R.), relinquishes his commn. on account of ill-health contracted on active service, and is permitted to retain his rank, Oct. 24th (substituted for notification in the "Gazette" of Nov. 7th).

Lt.-Col. G. R. A. Holmes, C.M.G., O.B.E., relinquishes his commn. on account of ill-health contracted on active service, and is permitted to retain his rank, Nov. 12th.

PERSONAL NOTICES.

NAVAL.

ENGAGEMENT.

EVANS—LINDSELL.—A marriage has been arranged between Mr. M. W. H. Evans, late flight lieutenant, R.N.A.S., only son of Mr. W. J. Evans, C.B.E., and Mrs. Evans, of Glencourt, Brondesbury Park, and Nancy, elder daughter of Mr. and Mrs. R. J. Lindsell, of Fairfield Bury, St. Ives, Huntingdonshire.

BIRTH.

NICHOLL.—On Oct. 29th, at 55, Welbeck Street, W.1, to Peggy, wife of Lieut.-Col. Vincent Nicholl, D.S.O., D.S.C., R.A.F.—a son.

MILITARY.

DEATH.

GILBERTSON.—Lieut. Dennis Henry Stacey Gilbertson, 6th Northamptons and 70th Squadron, R.A.F., who was previously reported missing on Sept. 4th, 1918, is now officially presumed to have been killed in action on that date at Ecaillon. He was the only son of A. Stacey Gilbertson and Mrs. Gilbertson, of Mangrove, Hertford, and 41, Earls Avenue, Folkestone.

ENGAGEMENTS.

GRAHAM—BODINGTON.—A marriage has been arranged and will shortly take place between Squadron Leader J. B. Graham, M.C., A.F.C., R.A.F., son of the late Malcolm Graham, Yankalilla, South Australia, and Lillias, widow of Capt. C. H. Bodington, Royal Horse Guards, elder daughter of Mr. and Mrs. C. May Somerville, 49, Holland Park, W.

WEBB-BOWEN—HADLEY.—A marriage has been arranged, and will take place very shortly, between Air Commodore T. I. Webb-Bowen, C.B., C.M.G., R.A.F. (late Brig.-Gen. R.F.C.), and Violet, elder daughter of Mr and Mrs. C. A. Hadley, of Johannesburg, South Africa.

MARRIAGES.

ROBERTS—WEST.—On Nov. 7th, at St. Paul's, Covent Garden, Herbert Charles Roberts (late H.A.C. and R.A.F.), youngest son of the late Henry Roberts, of Upper Clapton and Henllan, North Wales, was married to Marjorie Beatrice West, only daughter of the late Stephen West, of Croydon, Surrey, by the Rev. A. Monks.

STATON—WORKMAN.—On Nov. 15th, 1919, at Holy Trinity Church, Northwood, Lieut. William Ernest Staton, M.C., D.F.C., R.A.F., elder son of Mr. and Mrs. W. N. Staton, of Hatton, Burton-on-Trent, was married to Norah Carina, second daughter of Mr. and Mrs. R. D. Workman, of Overdene, Northwood, Middlesex, by the Rev. H. V. Farnfield, M.A.

BIRTHS

GOSSAGE.—On Nov. 21st, 1919, at 12, Cornwall Gardens, S.W.7, the wife of Squadron-Leader E. L. Gossage, D.S.O., M.C., Royal Air Force, late Royal Artillery, of a son.

HEGARTY.—On Oct. 15th, at Lampeter, Mount Hermon, Woking, the wife of Captain H. G. Hegarty, M.C., late R.A.F., of a daughter.

AIR FORCE.

ENGAGEMENTS.

HUGHES—MAINE-TUCKER.—The marriage between Captain Eric Yorath Hughes, late R.A.F., elder son of Sir Thomas Hughes and Lady Hughes, O.B.E., of Cardiff, to Miss Dulcie Maine-Tucker, younger daughter of the late Mr. W. H. Maine-Tucker, of Penarth, Glam., will take place at St. James's Church, Piccadilly, on Wednesday, Dec. 17th.

McKEAN—WARREN.—A marriage has been arranged, and will take place shortly, between Capt. Lionel Douglas Dalzell McKean, R.A.F., youngest son of Mr. and Mrs. Hugh McKean, of Rathgar, Dublin, and Phyllis Maude, youngest daughter of A. J. Warren, late British Vice-Consul of Java, and Mrs. Warren, of Burghdown, Epsom.

MATHEW—ALEXANDER.—The engagement is announced between Flight Lieut. Cecil George Mathew, R.A.F., younger son of A. C. Mathew, of Cranford, Church Crookham, Hants, and Emily Geale Hester Lowry, youngest daughter of the late Colonel C. M. Alexander and Mrs. Alexander, of Termon, Carrickmore, Tyrone.

VOSPER—VAUGHAN.—The engagement is announced between Mr. R. A. Vosper, R.A.F., only son of H. O'D. Vosper, Esq., and Mrs. Vosper, of Plymouth, and Hilda, youngest daughter of Mr. A. Vaughan and Mrs. Vaughan, of New Cross, London.

YOUNG—JAMESON.—The engagement is announced between Capt. P. H. Young, R.A.F.M.S., Halton Camp, Bucks, and Jean, younger daughter of Mr. H. Jameson, Craigard, Perth, N.B.

MARRIAGE.

BEETON—TILLSTON.—On Nov. 11th, by special licence, at St. Peter's Church, Brighton, Capt. Bernard James Beeton, M.B.E., R.A.F., was married to Dulcie, daughter of Mr. and Mrs. Tillston, of Brighton, by the Rev. Canon and Prebendary F. Dormer Pierce, B.A., Vicar of Brighton.

BIRTHS.

BOUSTEAD.—On Sunday, Nov. 2nd, at Hove, the wife of Capt. Cedric Boustead, late R.A.F., of a daughter.

SMYTHIES.—On Oct. 26th, at Colasta, The Avenue, Andover, the wife of Major B. E. Smythies, D.F.C., R.A.F.—a daughter.

STREATFEILD.—On Oct. 26th, at 68, Holland Road, Kensington, W., to Marjorie and Geoffrey H. B. Streatfeild (late Capt., R.A.F.)—a daughter.

DEC. 3, 1919.

ON SIX MONTHS OF CIVIL AVIATION—II.

Records, Satisfactory and Unsatisfactory.

Ignoring the first paragraph, which is merely a promise, or a threat, of more Regulations, and seems to have wandered into this position by accident, the figures which follow from the official document are of remarkable interest:—

An Air Navigation Bill, to make operative the International Air Convention recently signed in Paris in accordance with its requirements, is being drawn up under which the Regulations revised to date will be reissued.

The following approximate figures, which have been supplied voluntarily by certain of the firms engaged in civil air traffic, are interesting as showing the extent of the work carried out, and for the mileage covered the number of accidents must be regarded as remarkably small.

Number of hours flown	4,000
Number of flights	21,000
Number of passengers	52,000
Approximate mileage	303,000
Total number of accidents	13
Number of fatal accidents	2

	Total Numbers.	Per 1,000 Flights.	Per 1,000 hours flown.
Pilots killed	2	.095	.5
Pilots injured	6	.286	1.5
Passengers killed	Nil	Nil	Nil
Passengers injured	10	.476	2.5

Percentage of passengers injured to those carried, .019; in other words, for every 5,200 passengers carried only one has been injured.

It will be noted that the great majority of the flights were of short duration.

Indeed, much of the work during the period under review may be said to have been of an educative character. At the same time, since the greater number of accidents occur in getting off and landing, the proportion of accidents to flights made is a truer guide than that for hours flown. The figures clearly establish the fact that firms are intent on securing the safety of the public and also that the regulations in force are in principle suitably designed to attain that object.

The figures speak for themselves and need no explanation. The total number of passengers carried (52,000) is probably an under-estimate, for it is supplied "voluntarily by certain of the firms," which leaves one to assume that others, especially the unlicensed pilots with uncertificated machines, did not supply their figures. Also it does not include the illicit "joy-rides" given to civilians on R.A.F. machines.

The mileage is certainly an under-estimate, at any rate if calculated on a "passenger-mile" basis. It is probably about right as a "machine-mile" calculation, but the shortest joy-ride of 10 minutes must cover quite 10 miles, and so three passengers and a pilot in an Avro represent 40 "passenger-miles." On that basis, 750,000 passenger-miles for the four months from mid-June (when flying really began) to mid-October (when it ended) would be quite a fair estimate.

A very ingenious and quite sound point is made by the compilers of the Synopsis in claiming that "the proportion of accidents to flights is a truer guide than that for hours flown"—or, one would add, for passenger-miles. But, for comparison with other means of transport, especially with steamer lines and railways which keep careful statistics, passenger-mile figures count for most. One doubts whether any railway line can beat half a million passenger-miles without a death and with only two railway servants killed.

One's only quarrel with this section of the Synopsis is the claim that "the figures clearly establish the fact that . . . the regulations in force are in principle suitably designed to attain" the safety of the public. This is, in effect, a claim that the Department of Civil Aviation is largely responsible for the excellent passenger-mile record.

One denies any right to such a claim. The Department delayed the start of civilian flying for months, when joy-ride concerns might have been making good money. It prevented good pilots and good machines from getting to work by its eternal delays and imbecilities and petty annoyances over certificates and permits and so forth. It allowed incompetent minor officials to be a perpetual nuisance to everybody. And compared with its method of conducting correspondence, those of the famous Circumlocution Office were models of expeditiousness.

If there is anything to be said on the subject it is simply that "the figures clearly establish the fact that firms intent on securing" business will get it, in spite of any civilian Government Department.

The Question of Accidents.

We now come to the all-absorbing question of accidents, as follows:—

(*d*) Accidents.—Stress has been laid on the necessity for the punctual report and investigation of accidents, as only by this means can the weak points in administration, personnel and material be eliminated and the safety of the public proportionately increased. The organisation for this work built up during the war by the R.A.F. has been absorbed by the Civil Aviation Department. On receipt of the report of an accident involving a fatality, or injury to personnel, or serious damage to a machine, experts are immediately sent to investigate matters on the spot. This work has fortunately been exceedingly light and the facilities afforded by the firms concerned have enabled the necessary investigations to be carried out satisfactorily.

It is certainly satisfactory to know that accidents have been so few and that the firms concerned have afforded facilities to the Accidents Committee to investigate. But what is the good of investigating accidents if nobody is any the wiser for the investigation except a few people in the Air Ministry?

These are two excellent reasons why a report should be published on every accident which is investigated by the Committee, whether fatal or not. The first is that all who are concerned with the design and construction of aircraft, or who are interested in using, buying, or selling aircraft, should know why accidents happen, and

should thus be educated in means of preventing them or should be instigated to think out ways of preventing them in future. The second is that the publication of such reports would dispel once and for all the crop of foolish rumours which surrounds every notable accident immediately after it has happened.

The publication of such reports is desirable in the interests of Civil Aviation in general and of the makers of the smashed machines in particular. It is possible that reports on accidents are circulated to certain British aircraft constructors, but that is not enough. Knowing the habits of British business offices one is sure that such reports would never reach the right people in the works, and even if they did they would not be seen by the thousands of others to whom they would be of great value.

It would probably be inadvisable to circulate them to the daily Press, who would merely seize upon the most ghoulish details and star them in big headlines. But they should certainly be published in the technical papers.

Disappointing Figures.

The next section is devoted to the disappointing figures for licenses, thus :—

(*e*) Aerodromes and Licensing.—In the same way as ships require harbours, so aeroplanes and seaplanes require aerodromes, which have to be built, inspected and licensed. Licences also are necessary for the pilots competent to control the machines, and for the officials at the aerodromes qualified to pass machines as fit for flying, while every civil machine has to be registered and numbered in the same way as a motor-car, and, if flying for hire, must in addition be certified as "airworthy." A special branch of the Department of Civil Aviation deals with this and kindred questions, and between May 1st and October 31st has granted the following licences and certificates :—

Licences for Pilots	374
Licences for Ground Engineers	258
Licences for Engineers	1
Licences for Navigators	2
Licences of Aerodromes	92
Certificates of Registration	303
Certificates of Airworthiness	241

The reason that there has as yet been little or no demand for engineers' or navigators' licences, is that conditions which would necessitate the inclusion of these classes in the crew of an aircraft are not yet common.

The large majority of the aerodromes licensed have been those in the vicinity of towns required temporarily by firms engaged in carrying passengers for short flights.

It is believed that the London terminal Customs aerodrome at Hounslow is the only one of its kind in Europe, and that the organisation for dealing with regular traffic arriving by air from other countries has not elsewhere been so fully developed. Lympne for aeroplanes and Felixstowe for seaplanes have also been constituted as Customs aerodromes.

During the six months under review, an approximate sum of £2,000 has been received at Hounslow, in payment of housing and accommodation fees, etc., apart from the sale of petrol and oil. From this fact it is fair to assume that a definite revenue will be derived from the main aerodromes of the future.

In addition to the licensing of aerodromes already carried out negotiations are in progress for the establishment of land or sea aerodromes under the control of the Municipal Authoities, to serve the undermentioned localities :—

Edinburgh.	Bradford.
Newcastle.	Hull.
Southport.	Manchester.
Liverpool.	Margate.
Leeds.	Southampton.

For emergency landing grounds a large number of possible sites have been notified by Lords Lieutenant. The inspection of these sites, however, must, of necessity, cover a considerable period, and some time must elapse before maps showing the emergency landing grounds available in each county can be completed.

The figures for all licences are very unsatisfactory, and show in a most disappointing manner how small is the total amount of civilian flying. It is true that a certain number of unlicensed aviators and aeroplanes are flying, but there are not enough of them to affect the figures noticeably.

When one considers the thousands of pilots who were flying during the war it is lamentable that less than 400 should be flying to-day. There must have been nearly as many before the war, seeing that 863 aviators' certificates had been issued up to August 4th, 1914, in this country alone. It is true that many of them were Service people and that many never flew after qualifying for their certificates, but there certainly seemed much more flying before the war than there has been this year.

The figures for airworthiness certificates are equally disappointing. It hardly looks as if there can have been much civilian flying if only 241 machines were employed.

Still, it must be remembered that the Air Ministry prohibited civilian flying until so late in the year that it was impossible to make proper preparations for commercial work, and so all the organisation was of the sketchiest kind. Also, it must be remembered that the Committee of the Royal Aero Club, which appointed itself many years ago as the governing body for the Sport of Flying, has done nothing whatever to promote sporting flying right through the year, and that when it did busy itself over one event (the Schneider Cup Race) it made such an unholy mess of it that it did far more harm than if it had stopped at home and attended to its job of hotel-keeping—the only job at which it displays any competence or intelligence.

Therefore perhaps the figures are not so bad as they look, and indicate that the Aircraft Industry has achieved some success in spite of the Air Ministry and the Royal Aero Club.

The Hounslow Error.

One is mildly puzzled by the claim that Hounslow is the only terminal Customs aerodrome in Europe. One was under the impression that Le Bourgêt near Paris, Soesterburg near Amsterdam, and the aerodrome near Brussels fulfilled similar functions.

In any case Hounslow is no cause for congratulation, for it is the worst place possible for the purpose, being utterly inaccessible either by road or rail, as well as being on the wrong side of London. It is a consolation to learn—though not from this document—that Cricklewood is to be a Customs aerodrome in future. The astute Mr. Handley Page is to be congratulated. Indubitably Cricklewood will oust Hounslow as the recognised London terminal, for no other aerodrome can be found so near London or so well situated for quick communication by road.

One regrets to read that the impoverished Aircraft Industry has been "soaked" for £2,000 "in payment of housing and accommodation fees, etc." This accommodation could well have been given free of charge for the first few years.

Lympne is perhaps useful as an emergency landing aerodrome, and Felixstowe is the natural port of call for seaplanes from Holland, but one believes that a Southampton-le Havre air line will be very successful ere long, so it seems that another station will be necessary at Southampton.

It is encouraging to see that some Municipal Authorities are considering taking control of local aerodromes. As a rule town councils and such bodies are at least as stupid as Government departments or the Committee of the Royal Aero Club, but doubtless there are exceptions. It will be interesting to see which of the cities mentioned do in fact display intelligence and become possessed of municipal aerodromes.—C. G. G.

(*To be continued.*)

THE GREAT PEACE SCANDAL.

Probably the most scandalous of all the scandals of this devastating Peace is the finding of the Tank Inquiry Committee, which was published on Nov. 28th.

By this finding Sir William Tritton and Major Wilson were given £15,000 to divide between them. Major-General Swinton was given £1,000. Sir E. Tennyson d'Eyncourt was given £1,000. Mr. R. F. Macfie was given £500, and Mr. A. C. Nesfield was also given £500.

Nobody grudges the £15,000 to Sir William Tritton and Major Wilson. If anything, they deserved more. As engineers they were set to work to make a production job of the elementary armoured caterpillars on which the Landships Committee of the period decided. They produced in quantities, they did good work, and they are now rewarded.

Major-General Swinton also probably deserved more, for, besides doing the organising work which was his duty, he turned his great ability onto supplementary work as a propagandist. Also, being a Sapper officer, he contributed materially to the mechanical efficiency of the apparatus.

Why Sir Tennyson d'Eyncourt received anything is not very clear. As an Admiralty designer he was turned onto design, and he designed, as was his duty. His regular pay was presumably based on his ability as a designer, and if his ability in this instance appeared abnormal the Admiralty should have increased his pay. Still, none can grudge him a £1,000 bonus for his share in producing an absolutely novel instrument of war.

Nor presumably will anybody grudge Mr. A. C. Nesfield the gift of £500 for any extra brainwork or overtime which he may have expended at his works when they were occupied in producing the experimental models of tanks ordered by Commander Boothby, then O.C. Armoured Car Division, R.N.A.S.

The scandal is that Mr. R. F. Macfie, the real originator of the Tanks, should be insulted with a paltry £500 after having introduced not only the vehicle itself but its proper method of operation to the Government.

QUEER PROCEEDINGS.

Some of those who attended the meetings of the Inquiry Committee, among them the present writer, were surprised at the curious way in which some evidence was admitted while other evidence of greater importance was ruled out of court. It was plain that under such conditions the Committee could never have the whole story placed before them.

And it was equally surprising to find that the various claimants were limited as to the number of witnesses whom they were allowed to call. The impression conveyed to one was that the Committee was more anxious to get the whole thing over and finished than it was to thrash each claim out to the limit in an endeavour to discover the truth.

Nevertheless, after Colonel DelaCombe had stated that he had introduced Mr. Macfie to the Admiralty in order that his armoured caterpillar design might be considered: after Colonel Risk, the first O.C. Armoured Cars, had stated that he had introduced Mr. Macfie to his armament officer in order to discuss details of the machine: after Colonel Boothby, the second O.C. Armoured Cars, had related how he detailed Mr. Macfie to construct a working model of his machine: and after it was clearly shown that the ultimate Tanks derived from these early experiments, one would have thought that even a Government Committee would have recognised his right to be considered the originator of the idea.

Given such recognition it is difficult to see how he deserved less reward than did the two excellent engineers who produced the design which at last went into action on the Somme in September, 1916, just on *two years* after Mr. Macfie introduced an almost identical general design to the Armoured Car Division and to the Admiralty.

THE CUSTOM OF THE COUNTRY.

The result is perhaps not very surprising, for the inventor or the designer, of a genuinely novel machine never makes as much money as those who make to his designs. One could not expect Mr. Macfie to be given a sum equal to the profits made by the firms who supplied the parts of the tanks which broke and left the gallant crews at the mercy of German guns. Nor could one expect him to receive a sum equal even to the profit on the paint with which the tanks were rendered conspicuous. But one might reasonably have expected that he would receive enough to set him up in a nice little business in this country, instead of merely a sum about equivalent to that which the Treasury would have expended if he had been tried and deported as an undesirable alien when he first landed in this country with the Tank scheme in his head.

TANKS AND AIRCRAFT.

The reason why one devotes space to this subject in THE AEROPLANE is that in future wars Tanks and aircraft will be very closely allied. Tanks with aeroplane reconnaissance will operate much as ships will operate with aeroplane scouts at sea.

Also, in 1915, long before Tanks ever went into action, this paper did its best, guardedly in print, and by private correspondence, to force those in authority to pay attention to this new weapon. But, as usual, all efforts failed to move the civilian experts in charge, though the active service soldiers were quick enough to see the value of the machine.

It may be of interest to note that Mr. Macfie's designs have always been a year or two in front of the official designs, until quite lately when some very able people have taken charge of Tank affairs, and have not disdained to treat Mr. Macfie as an engineer whose suggestions are worthy of consideration.

One suggests that the best use that Mr. Macfie can make of his paltry £500 is to go to Germany or America, where his latest designs for high-speed landships capable of standing up to gun fire are likely to be appreciated and useful.—C. G. G.

SPECIAL BRITISH AIRCRAFT CONSTRUCTORS' ISSUES.

The Paris Aero Show begins on December 19th. On December 17th THE AEROPLANE will publish the first of Three Special Issues devoted to the products of British Aircraft Constructors. These Special British Aircraft Constructors' issues will provide a complete review of the British Aircraft Industry while the French Aircraft Industry is enjoying the advantages of its Exhibition. Copies of these issues should be ordered in advance so as to assure delivery. If desired copies will be sent by post for 7d. from The Aeroplane Publishing Offices, 61, Carey Street, W.C.2.

M. HENRI DEUTSCH (DE LA MEURTHE).

There are men in life who, possessed of wealth and all things that tend to make existence happy, make no effort to achieve those great things which bring public fame, yet who quietly and unobtrusively give material and moral assistance to struggling science or impoverished art. Of these was M. Henri Deutsch (de la Meurthe) who died in Paris on Nov. 24th. Born in 1846 he became in early life a pioneer in the development of the oil industry in France. With his brother he controlled the great firm of A. Deutsch (de la Meurthe) and Sons, vegetable and mineral oil merchants. It was an unpoetic beginning.

He took a great personal interest in the development of the internal combustion engine and in 1899 he demonstrated to President Carnot at the Paris Exhibition a new oil-driven car. But his efforts were directed towards the general furtherance of motoring and aeronautics. He was a founder member both of the Automobile Club de France and the Aero Club de France—of which he became President in later years.

Not only did he finance early experimenters with airships and aeroplanes, but he gave large sums of money in prizes for specific feats in aeronautics. One prize of £4,000 was won by M. Santos-Dumont with his dirigible in 1901 by a flight from St. Cloud to the Eiffel Tower and back within a period of half an hour. Other prizes followed, including many specifically allotted to aviation. Often in these matters he worked in co-operation with M. Archdeacon, another patron of aeronautics.

He gave the money (500,000 francs) with which the Aero Technical Institute at St. Cyr was founded and he endowed a Chair of Aeronautics at the Conservatoire des Arts et Métiers.

To the country itself he has displayed direct generosity. In 1909 he presented an airship, "La Ville de Paris," which he had had constructed at his own expense, to the Government in replacement of the airship, "La Patrie," which had recently been destroyed.

In 1911 he was present in company with the Premier and many leading members of the Government at the start of the Paris-Madrid race and was injured in the accident which killed M. Berteaux, the Minister of War, and amputated the arm of M. Monis, the Premier.

Many of the great aeronautical firms in France owe their existence to the money of M. Deutsch. Not only had he the interest of a patron in the matter but he showed a close practical interest in aviation, flying as passenger in many aeroplanes created by firms with which he was connected. Many machines he purchased and so accumulated a greater private stable of aeroplanes than any, save M. de Mumm.

The Government of the French Republic showed appreciation of his services by appointing him a Commander of the Legion of Honour in 1911.

Not only was he interested in the somewhat mechanical art of aviation but he had a great knowledge of music. In this, again, he was a patron of discrimination and gave assistance to many artists whose sole crime was poverty. In company with the Prince of Monaco and the Comtesse Greffulhe he subsidised competitions to encourage composers whose talents had met little public recognition. Here again he had practical knowledge and had composed many pieces, including an opera, suitably entitled "Icare," which was produced in 1912 at the Opera, in Paris.

At Deauville in the past autumn he had an accident in a motor-boat which revived the old troubles consequent upon his injuries of 1911, and from this relapse he failed to recover.

France has suffered a great loss by his death, and the world of aeronautics is robbed of one of its most distinguished figures. Modesty, coupled with true enthusiasm, directed his career.—H. F.

THE FLIGHT TO AUSTRALIA COMPETITION.

THE VICKERS MACHINE.

The following telegram from Crete, dated Nov. 17th, was received on Nov. 25th :—

Left Rome yesterday morning 9 a.m.—landed Taranto 11.45.—Again low clouds—visibility bad.—Passed over Capua Naples then turned east over mountains. Flew low over Vesuvius, but weather too bad to photograph.—Very bumpy over mountains, machine falling several hundred feet at times.—Good wind helping us.—Greatest assistance afforded us Taranto by aerial route.—Spent afternoon on machine.—Suda Bay reported good so decided land there to avoid long sea stretch.—Left Taranto 8 to-day.—Arrived Suda 3.45.—Strong wind on our beam.—Low clouds, rain all way to South Greece.—Attempted get above clouds but too high so flew at 800 feet.—Following coast nearly hit small island in mist.—South Greece to Crete good weather, slight head wind.—Aerial route station here giving all assistance.—Hope Cairo to-morrow.—Crew fit.—Hoping better weather now much warmer.—(Signed) ROSS SMITH.

The following telegram from Cairo dated Nov. 18th was received on Nov. 24th :—

Left Suda Bay eight to-day.—Arrived Cairo 3.30.—Weather again bad.—Low clouds made crossing Crete mountains difficult.—Wind slightly favourable.—Steered South course after leaving, but had fly through rain at 2,000 feet most way across Mediterranean.—Passed two steamers half way, checked ground speed and drift on them.—Crossing took two and half hours.—Struck African coast Sollum, then flew east to Cairo across desert via Matruh and Wadinatrun.—Hope Damascus or Bagdad to-morrow.—All very pleased to have got here.—Hope for better weather now.—So far have taken thirty flying hours mostly through rain and storms.—Throughout greatest assistance rendered by aerial route stations.—Nothing being too much trouble.—Largely due their excellent organisation we here so soon.—Vimy going perfectly.—Ross SMITH.

The machine was then reported to have reached Damascus on Nov. 19th.

The following telegram from Delhi dated Nov. 25th has been received :—

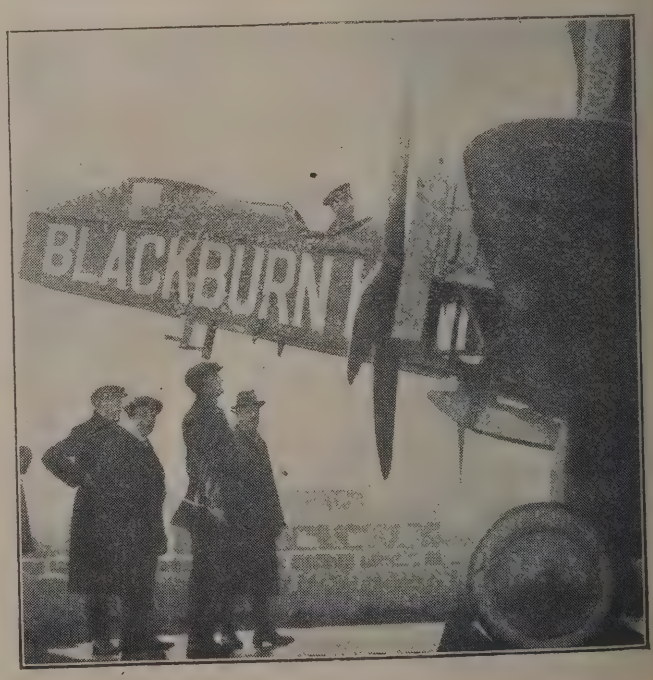
Ross Smith arrived Delhi, 4.15, 25th. Everything O.K. Proceeding Allahabad on 27th.

The Air Ministry announced on Dec. 1st that advice had been received from India that the Vickers-Vimy machine arrived at Allahabad at 5.0 p.m. on Nov. 27th, and left for Calcutta at 8.30 a.m. on the next day.

THE BLACKBURN MACHINE.

The Blackburn "Kangaroo" which left Hounslow on Nov. 21st left Romilly at 9.40 a.m. on Nov. 25th. St. Raphael was reached at 4 p.m. on Nov. 28th, and the machine left for Capua at 9.30 a.m. on the next day. The weather was fine but cloudy.

A message received from Italy stated that the "Kangaroo" landed at Pisa on Nov. 29th, where the pilot reported heavy wind and rain. On the next day the flight was resumed and the machine arrived at Rome at 4.45 p.m. They intended to fly on to Taranto on Dec. 1st.



BRITISH AIRCRAFT COMPETITIONS, 1920.

The Air Ministry announced on Nov. 28th :—

Owing to the representations made by British Aircraft Manufacturers, the Air Ministry has decided to alter the date of the commencement of the Small Type Aeroplane Competition to June 1st, 1920. Entries for this competition will, therefore, not close until Feb. 1st, 1920. The dates already announced in connection with the other two competitions will remain the same.

Both of the aeroplane competitions will take place at the Aeroplane Experimental Station at Martlesham Heath, near Woodbridge, Suffolk.

The Seaplane (Amphibian) Competition will take place at Felixstowe, with the exception of the tests for landing upon and rising off the ground for this class which will be held at Martlesham.

THE BLACKBURN "KANGAROO."—The machine being tested before leaving Hounslow.

GREAT BRITAIN.

FROM THE COURT CIRCULAR.

BUCKINGHAM PALACE, Nov. 26th.

The King held an Investiture in the Ball Room of the Palace at 11 o'clock this morning.

The following were severally introduced into the presence of the King, when His Majesty invested them with the Insignia of the respective Divisions of the Order into which they have been admitted :—

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE (MILITARY DIVISION).—Commander.—Lt.-Col. Alexander Reiss, R.A.F.

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE.—Officers.—Military Division.—Maj. Thomas Baxenden, R.A.F.; Maj. Alban Ellerton, R.A.F.; Maj. Albert Levick, R.A.F.; Maj. William Michie, R.A.F.; Maj. George Stevens, R.A.F.; and Sqdn. Leader George Williamson, R.A.F.

Members.—Military Division.—Capt. the Hon. Edward Knollys, Lond. R., attd. R.A.F. (also received the Distinguished Flying Cross); Mrs. Florence Day, W.R.A.F.

The King then conferred decorations as follows :—

THE MILITARY CROSS AND BAR.—Capt. Erskine Lindop, Indian Army, attd. R.A.F.

THE DISTINGUISHED FLYING CROSS AND BAR.—Lt. Horace Young, R.A.F.

THE DISTINGUISHED FLYING CROSS.—Capt. Robert Caley, R.A.F.; Capt. William Carrothers, R.A.F.; Capt. Thomas Dickinson, 16th Cavalry, Indian Army, attd. R.A.F.; Flt. Lt. Bernard Cross, R.A.F.; Flt. Lt. Grahame Donald, R.A.F.; Flt. Lt. Eric Donaldson, R.A.F.; Flt. Lt. Cecil Fawssett, R.A.F.; Capt. Alan Hill, R.A.F.; Lt. Victor Beechcroft, R.A.F.; Lt. Oliver Cassels, R.A.F.; Flying Officer Thomas Coates, R.A.F.; Flying Officer James Craig, R.A.F.; Flying Officer Charles Findlay, R.A.F.; Lt. Spencer Ford, R.A.F.; Lt. Horace Hern, R.A.F.; Flying Officer Oscar Heron, R.A.F.; Flying Officer Walter Simon, R.A.F.; Sec. Lt. William Dollery, R.A.F.; and Sec. Lt. Norman Frome, R.A.F.

THE AIR FORCE CROSS.—Wing Comdr. Sydney Harris, R.A.F.; Sqdn. Leader John Graham, R.A.F.; Sqdn. Leader Irving Hartford, R.A.F.; Flt. Lt. Robert Hughes-Chamberlain, R.A.F.; Flt. Lt. Edward Davis, R.A.F.; Flt. Lt. Ronald Dean, R.A.F.; Capt. Norman Dimmock, R.A.F.; Capt. Alfred Gilligan, R.A.F.; Capt. John Gotch, R.A.F.; Flt. Lt. Geoffrey Hall, R.A.F.; Flt. Lt. Frederick Hartridge, R.A.F.; Flt. Lt. Harold Hemming, R.A.F.; Flying Officer Ralph Dixon, R.A.F.; Flying Officer Charles Hatcher, R.A.F.; Flying Officer Reginald Houghton, R.A.F.; and Lt. Charles Hyde, R.A.F.

The following had the honour of being received by His Majesty, when the King handed to him, as "Next-of-Kin," the decorations won by his relative in the War :—

THE VICTORIA CROSS, THE DISTINGUISHED SERVICE ORDER AND TWO BARS, AND THE MILITARY CROSS AND BAR.—Mr. Mannock : Awarded to his son, the late Maj. Edward Mannock, R.A.F.—On June 17th, 1918, Maj. Mannock attacked a Halberstadt machine near Armentières and destroyed it from a height of 8,000 ft. On July 7th, 1918, near Doulieu, he attacked and destroyed one Fokker (red-bodied) machine, which went vertically into the ground from a height of 1,500 ft. Shortly afterwards he ascended 1,000 ft. and attacked another Fokker biplane, firing 60 rounds into it, which produced an immediate spin, resulting, it is believed, in a crash. On July 14th, 1918, near Merville, he attacked and crashed a Fokker from 7,000 ft. and brought a two-seater down damaged. On July 18th, 1918, near Merville, he fired 80 rounds into an Albatros two-seater, which went to the ground in flames. On July 20th, 1918, east of La Bassée, he attacked and crashed an enemy two-seater from a height of 10,000 ft. About an hour afterwards he attacked at 8,000 ft. a Fokker biplane, near Steenwercke, and drove it down out of control, emitting smoke. On July 22nd, 1918, near Armentières, he destroyed an enemy triplane from a height of 10,000 ft. Maj. Mannock was awarded the under-mentioned distinctions for his previous combats in the air in France and Flanders :—Military Cross. Gazetted, Sept. 17th, 1917. Bar to Military Cross. Gazetted, Oct. 18th, 1917. Distinguished Service Order. Gazetted, Sept. 16th, 1918. Bar to Distinguished Service Order (1st). Gazetted, Sept. 16th, 1918. Bar to Distinguished Service Order (2nd). Gazetted, Aug. 3rd, 1918. This highly distinguished officer, during the whole of his career in the R.A.F., was an outstanding example of fearless courage, remarkable skill, devotion to duty, and self-sacrifice, which has never been surpassed. The total number of machines definitely accounted for by Maj. Mannock up to the date of his death in France (July 26th, 1918) is 50—that total specified in the "Gazette" of Aug. 3rd, 1918, was incorrectly given as 48, instead of 41.

BUCKINGHAM PALACE, Nov. 27th.

The King held an Investiture in the Ball Room of the Palace at 11 o'clock this morning.

His Majesty decorated the following with the Victoria Cross :—

Flying Officer Andrew Beauchamp-Proctor, R.A.F. (also received the Distinguished Service Order and the Distinguished Flying Cross).—Between Aug. 8th, 1918, and Oct. 8th, 1918, this officer proved himself victor in 26 decisive combats, destroying 12 enemy kite balloons, 10 enemy aircraft, and driving down four other enemy aircraft completely out of control. Between Oct. 1st, 1918, and Oct. 5th, 1918, he destroyed two enemy scouts, burnt three enemy kite balloons, and drove down one enemy scout completely out of control. On Oct. 1st, 1918, in a general engagement with about 28 machines, he crashed one Fokker biplane near Fontaine and a second near Ramicourt; on Oct. 2nd he burnt a hostile balloon near Selvigny; on Oct. 3rd he drove down, completely out of control, an enemy scout near Mont d'Origny, and burnt a hostile balloon; on Oct. 5th, the third hostile balloon near Bohain. On Oct. 8th, 1918, while flying home at a low altitude, after destroying an enemy two-seater near Maretz, he was painfully wounded in the arm by machine-gun fire, but, continuing, he landed safely at his aerodrome, and after making his report was admitted to hospital. In all he has proved himself conqueror over 54 foes, destroying 22 enemy machines, 16 enemy kite balloons, and driving down 16 enemy aircraft completely out of control. Capt. Beauchamp-Proctor's work in attacking enemy troops on the ground and in reconnaissance during the withdrawal following on the battle of St. Quentin from March 21st, 1918, and during the victorious advance of our Armies commencing on Aug. 8th, has been almost unsurpassed in its brilliancy, and as such has made an impression on those serving in his squadron and those around him that will not be easily forgotten. Capt. Beauchamp-Proctor was awarded Military Cross on June 22nd, 1918; Distinguished Flying Cross on July 2nd, 1918; Bar to Military Cross on Sept. 16th, 1918; and Distinguished Service Order on Nov. 2nd, 1918.

The following were severally introduced into the presence of the King, when His Majesty invested them with the Insignia of the respective Divisions of the Orders into which they have been admitted :—

THE MOST DISTINGUISHED ORDER OF SAINT MICHAEL AND SAINT GEORGE.—Companions.—Air Commodore Charles Longcroft, R.A.F. (also received the Air Force Cross); Wing Comdr. Arthur Godman, R.A.F.; Wing Comdr. Felton Holt, R.A.F.; Wing Comdr. Roland Hunt, R.A.F.

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE.

Member.—Military Division.—Lt. Joseph Andrews, R.A.F.

His Majesty then conferred decorations as follows :—

THE MILITARY CROSS, THE DISTINGUISHED FLYING CROSS, AND THE AIR FORCE CROSS.—Flt. Lt. Gerald Maxwell, R.A.F.

THE MILITARY CROSS AND THE DISTINGUISHED FLYING CROSS.—Lt. George Gibbons, R.A.F.

THE MILITARY CROSS AND THE AIR FORCE CROSS.—Flt. Lt. Thomas Martyn, R.A.F.

THE DISTINGUISHED FLYING CROSS AND BAR.—Flying Officer John Griffith, R.A.F.; and Flying Officer William Harvey, R.A.F.

THE DISTINGUISHED FLYING CROSS.—Capt. Joseph Hallonquist, R.A.F.; Capt. Claud Morley, R.A.F.; Lt. Victor Dreschfeld, R.A.F.; Flying Officer William Green, R.A.F.; Lt. Gerald Griffin, R.A.F.; Lt. Philip Holligan, R.A.F.; Flying Officer James Holmes, R.A.F.; Flying Officer John Mayer, R.A.F.; Lt. Allan McGregor, R.A.F.; Lt. Bernard Porter, R.A.F.; and Lt. James Young, R.A.F.

THE AIR FORCE CROSS.—Flt. Lt. Herbert Irwin, R.A.F.; Flt. Lt. Neville Kemsley, R.A.F.; Flt. Lt. Frederick Lander, R.A.F.; Capt. Edward Landon, R.A.F.; Capt. James Line, R.A.F.; Capt. Peter Martin, R.A.F.; Flt. Lt. Angus McColl, R.A.F.; Flt. Lt. Cedric McDonald, R.A.F.; Flt. Lt. Denis Mulholland, R.A.F.; Flying Officer John Jennings, R.A.F.; Flying Officer John Lawson, R.A.F.; Flying Officer William Leete, R.A.F.; Flying Officer Harold Lydford, R.A.F.; Lt. Ivor McIntyre, R.A.F.; and Flying Officer Arthur Moody, R.A.F.

* * *

The following is extracted from the "Court Circular" of Dec. 1st :—

"The Prince of Wales arrived at Portsmouth on board H.M.S. 'Renown' (Capt. Ernest Taylor, R.N.) on his return from Canada and the United States of America. . . .

"The Prince of Wales was received on landing by the Prince Albert and . . . the Air Officer Commanding, Coastal Area. . . .

"The Prince of Wales, accompanied by the Prince Albert, with the Staff in attendance, travelled by special train on the London, Brighton, and South Coast Railway to Victoria Railway Station. . . .

"There were also present at the Railway Station . . . representatives of the Royal Navy, the Army, and the Royal Air Force. . . ."

NAVAL.

ADMIRALTY APPOINTMENTS.

The following appointments have been made :—

Nov. 25th.—Lt. C. R. Price, to "Pegasus," on recommg., Nov. 24th.
Sub-Lt.—E. T. Young, to "Pegasus," on recommg.
Mate.—T. Culliford, to "Pegasus," on recommg.
Nov. 27th.—Lt.—H. A. Taylor, to "Pegasus."
Payr. Commr.—H. E. Symons, O.B.E., to "Ark Royal," Jan. 1st.

H.M.S. "PEGASUS."

The following particulars are to hand concerning the aircraft-carrier "Pegasus." Built during the war, she was given the name of the light cruiser which was sunk by "Konigsberg" while at anchor at Zanzibar repairing her machinery. "Pegasus" joined the Grand Fleet after the Battle of Jutland, and last April was allocated for duty with the new Atlantic Fleet. She was recently sent away on detached service under Commander Oliver Stokes, D.S.O., R.N.

IN THE PRIZE COURT.

Mr. Wilfred Lewis, who appeared on behalf of the claimants, read, on Nov. 25th in the Prize Court before the President the Rt. Hon. Sir Henry Duke, an affidavit by Capt. Charles Edward Stafford Lusk, who said that he was senior surviving officer of His Majesty's seaplane 8,695, which on Sept. 22nd, 1917, was operating under the directions of the Admiralty and was then under the command of Flight Lieut. Norman Ausley Magor, who was killed in action on April 25th, 1918. When they were over the North Sea the crew of the seaplane saw an enemy submarine, which was believed to be the U.C.72. Bombs were dropped and one destroyed the submarine, with her crew of 32 hands.

The President granted a declaration that the bounty payable was £160 for the U.C.72.

Solicitors.—Messrs. A. Tyler and Co. (instructed by Messrs. Stilwell and Sons, Navy and Prize Agents) for the claimants; the Treasury Solicitor for the Procurator-General.

MARTINSYDE

DESIGNERS OF THE FAMOUS

F4 FIGHTER

WHICH ESTABLISHED THE

FINEST PERFORMANCE

FOR CLIMB AND SPEED AT HEIGHT.

A ROLLS-MARTINSYDE

CARRIED GOVERNMENT DESPATCHES

FROM LONDON TO PARIS

IN 75 MINUTES.

COMMERCIAL TYPE A.

INQUIRIES INVITED FOR PASSENGER—OR MAIL—CARRYING MACHINES OF THIS TYPE.
SPECIFICATIONS WILL INCLUDE

285 H.P. ROLLS-ROYCE FALCON ENGINE, or
300 H.P. HISPANO-SUIZA ENGINE.

APPROXIMATE PRICE £2,500.

Note.—All above Types can be fitted with interchangeable land undercarriage or seaplanes.
SPECIAL PROVISION IS MADE FOR HOT CLIMATES.

MILITARY.

THE CASUALTY LIST.

Reported on Nov. 28th.

Previously Reported Missing, now Reported Killed.—RAPER, Sec. Lt. S. E., Seaf. Highrs, attd. R.F.C.

Reported on Dec. 2nd.

Previously Reported Missing, now Reported Killed.—Ellis, Lt. P. C., High. L.I., attd. R.F.C.
Sage, Sec. Lt. D. M., R.F.C.
Streather, Lt. E. H. P., R.F.C.

THE WAR IN AFGHANISTAN.

A good deal of damage has been done by the air raids over the Mahsud territory. Up to Nov. 19th the casualties amounted to a hundred dead. Among the killed at Kamicuram, the chief town, was the son of the Chief of the Bahdozai. Over five tons of bombs have been dropped by twenty-five aeroplanes.

A Bristol Fighter recently made a bad landing near Datta Khel. The occupants were unhurt.

Reuter telegrams from India dated Nov. 28th show that the frontier situation is improving. In view of the peace feelers put out, it is proposed to inform the Mahsud Maliks that if they really are considering the acceptance of the terms the bombing of the local jirgah will be suspended for 24 hours.

AIR FORCE.

UNDER MILITARY LAW.

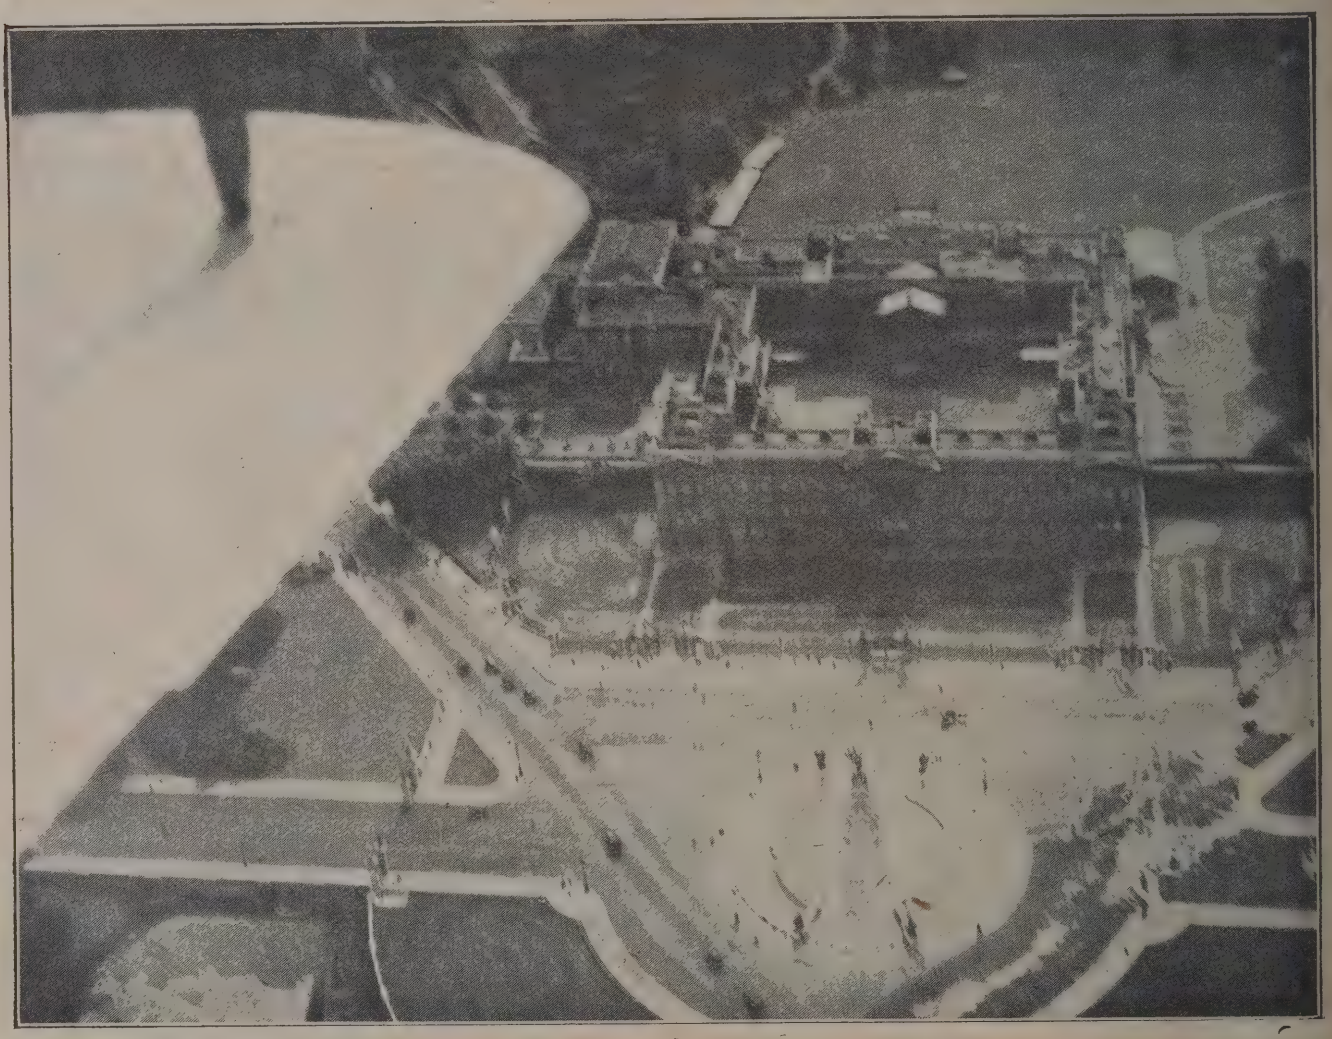
An Order of the Army Council and the Air Council issued recently provides that officers and airmen of the Royal Air Force acting with the military forces under or within the Command of the General Officer Commanding-in-Chief the British Army of the Rhine shall in all respects be subject to the Army Act while on active service as if they were officers and airmen attached to the Army.

THE RE-OPENING OF RECRUITING FOR THE R.A.F.

The Air Ministry announced on Nov. 28th :—

Owing to the large number of men who are due for discharge on the completion of their engagements, recruiting for the R.A.F. has now been re-opened, and there are vacancies for skilled mechanics of various trades.

Engagements are for four, six or eight years with the colours, with eight, six or four years respectively with the reserve.



In view of the newly revised rates of pay of the Force the openings are distinctly attractive, particularly as men will be working at their own trades and constantly gaining fresh experience which will be of great value to them on their return to civil life, by which time, in all probability, there will be a greatly increased demand for aircraft workers of all categories.

Skilled aircraft workers who are at present unemployed, of thos ewho are not employed in their own trades would, therefore, be well advised to consider the possibilities of the careers offered by the Service.

Full details as to pay, etc., may be obtained from 4, Henrietta Street, London, W.C., or from any R.A.F. Station.

"DEFICIENCIES."

Demobilisation and reductions in establishments always produce trouble and dissatisfaction. It is unavoidable under the conditions governing these matters. But there are certain grievances requiring redress. One of these is the liability of commanding officers for the deficiencies in the accounts and stores of their units. In ordinary times, and under ordinary conditions, it is proper that commanding officers should be held liable for losses and omissions, which presumably would not have happened had their powers of command been exercised with due efficiency. But of recent months Air Force units in course of dissolution have changed their commanding officers with great rapidity, and it has become increasingly difficult to allocate the blame for deficiencies. Each new commanding officer has had to take over from his predecessor in order that the unit might be closed down and the accounts have frequently been in inextricable confusion, with the result that the last C.O. has had to pay large sums of money when the closing down has been completed. It is hard that he should have to pay for the carelessness or inefficiency of those who went before. Would it not be possible to "write off" these deficiencies when it is found impossible to discover who was originally

An aerial photograph of Buckingham Palace taken from an Airco Biplane.

The "Bristol" Aeroplanes

"BRITAIN'S PIONEER AIRCRAFT CONSTRUCTORS."

The "BRISTOL" Tourer has proved a great success as a high-speed carrier of passengers or cargo, whilst the "BRISTOL" construction is in itself the highest guarantee of dependability, economy of upkeep and length of service.

Dual controls are normally fitted, though the machine can be supplied with pilot's controls only. Either 275 h.p. Rolls-Royce Falcon III engine or 230/240 Siddeley Puma engine can be fitted. The main specifications are;—

Weight Empty	1750 lbs.
Weight Loaded	2800 lbs.
Wing Span	39 ft. 3 in.
Wing Area	405 sq ft.
Wing Loading	6.92 lbs. per sq.ft.
Maximum Height	10 ft. 1 in.
Overall Length	25 ft. 9 in.
Petrol Capacity	70 gals.
Best Speed	125 m.p.h.
Cruising Speed	90 m.p.h.
Range	560 miles.

Further particulars will be supplied on application to—

THE
BRITISH & COLONIAL AEROPLANE CO., LTD..
FILTON — BRISTOL.

Telegrams: "Aviation, Bristol." Codes: A1, A.B.C. & Moreing. Telephone: 3906 Bristol.

responsible for the losses? It is customary in the Army to "write off" losses when the elements of fraud or criminal negligence are absent. Why should not the Air Force adopt a similar procedure?

An Egyptian Incident.

On Nov. 22nd an aeroplane while flying over Cairo fell upon a private house in Abdin Square, thereby stopping a demonstration which was to have been held there. The top storey was badly damaged, but one of the aviators escaped unhurt, and the other was only slightly injured.

Major McCudden's Will.

Major James Thomas Byford McCudden, V.C., D.S.O., M.C., M.M., R.F.C., of Burton Road, Kingston-on-Thames, who was accidentally killed in France on July 9th, 1918, left an estate valued at £266 14s. 3d. As he died intestate and a bachelor, letters of administration have been granted to his father, Mr. William Henry McCudden, retired warrant officer, Royal Engineers, as next of kin.

Rugby Football.

On Nov. 26th the R.A.F. played against the United Services at Richmond, the result being 34 points to nil. A victory for the United Services.

This match again showed that the United Services are much too strong a side for the R.A.F. team, who played one man short throughout and two men short in the second half.

The Air Force seem to get together no better and are still very scratch. The forwards playing so short put up a very good fight under the circumstances. The United Services played very good football in the second half, the backs handling the ball accurately and running well. In the first half they were not so good, and missed chances.

R.A.F. Team:—Flying Officer Damant, full back; Flying Officer Wagner, Sqdn. Ldr. Neale, M.C., Flt. Lieut. Thomas, D.F.C., Sqdn. Ldr. Penny, threequarter backs; Sqdn. Ldr. Smart, Sqdn. Ldr. Pulford, half backs; F. Os. Maxwell, Wakefield, Rose, Flt. Lieuts. Simpson, Munday, Scroggs and Lees, forwards.

BRAZIL.

Military Organisation.

The military aeronautical programme now in course of fulfilment arranges for the creation during this year of three escadrilles of ten aeroplanes, and allocated respectively for fighting, bombing, and observation. In 1920 another eight escadrilles are being formed—four for observation, two for fighting and two for bombing.

A French military mission has organised a school of aviation near Rio de Janeiro, which was opened officially last July. Good workshops are already in existence and there are 30 school aeroplanes.

An officer is being sent to Europe to study the latest methods of aerial photography and its connection with cartography.

HOLLAND.

On Nov. 24th Lts. Land and Van Dyk, of the Royal Netherlands Flying Corps, were killed at Soesterberg while flying a Rumpler biplane, owing to the machine catching fire in the air.

Mr. Land was preparing for a flight from Holland *via* India to the Dutch East Indies. His death will be deeply regretted by all who knew him. He visited England recently and achieved remarkable popularity in the short time which he spent in this country. Also he was a frequent visitor to the E.L.T.A. Show at Amsterdam, where he met and made friends with many British aviators.

As a pilot he was very skilful and capable, flying always with care and good judgment, and he was eminently fitted for the great flight to the East which he had undertaken. He married recently an English lady who left Germany during the war. To her all Mr. Land's friends will offer their deep sympathy in her great sorrow.—C. G. G.

FRANCE.

A squadron of aeroplanes recently left St. Raphael for Dakar. The squadron is destined for an aviation centre in Senegal.

ITALY.

The Italian correspondent of THE AEROPLANE writes:—

The "Official Gazette" gives the following as the peace-time establishment of the Italian Aeronautical Corps:—

An Inspector of Aeronautics.
A Brigade of Chaser Aeroplanes.
A Brigade of Reconnaissance Aeroplanes
Two "Groups" of Balloonists.
One "Group" of Dirigibilists.
One Training Command.
A Head of the Armament Department.

Three hundred and ninety officers are to remain in the Aeronautical Corps under the command of a Major or Brigade-General.

Post-War News.

Now that the depression of the armistice is wearing off, I find that in one of my "hushed to sleep" brain-cells there are numerous records of the Great War activity of the Ponte S. Pietro flying camp, the nearest Military flying centre to my part of the world.

A fleet of brigantines is reported as being fitted with subsidiary aero-engines for use in calm weather and in harbour. Here is something better than the scrap heap for old war horse-power.

The Italian technical papers continue to sound a loud note of alarm about the Huns hiding their best 'planes. Certainly, of the 100 or so German booty machines at Monte Celio, none are of late type.

One awaits more about the S.I.A.I. 1,200 h.p. with four engines and central boat, building at Sesto Calende.—T. S. H.

PERSIA.

It is understood that British aeroplanes are assisting in the restoration of order to the Urumian-Tabriz region.

RUSSIA.

According to the "Morning Post" correspondent a Bolshevik balloon recently landed at Nykyrka, Finland. The occupant of this stated that the garrison of Krasnaya Gorka at present consists of 1,500 men. At Kronstadt there is such a serious scarcity of fuel that the population have begun to break up the wooden quays for firing. All the food supplies are exhausted.

U.S.A.

An Appropriation for Army Aviation.

An additional appropriation has been unanimously voted by the Military Committee for Army Aircraft Construction. The amount is $15,000,000 (normally £3,000,000) and it is allocated in order to cover the additional charges incidental on the establishment of aerial routes (military) to Panama, Alaska, and possibly Asia. The plans of these routes were outlined to the Committee by Secretary Baker and Brig.-Gen. William Mitchell, Director of Military Aeronautics.

The total appropriation for construction is now £8,000,000. With this sum it is proposed to build 200 pursuit, 200 bombing, and 200 experimental pursuit aeroplanes. In the bombing machines 300-h.p. Hispano-Suiza engines will be fitted, and in the remainder Liberty engines will be used. Over 12,000 of the latter are available.

NEW BRITISH RECORDS.

On Nov. 15th an Airco D.H.9R biplane, fitted with a 450-h.p. Napier engine, and piloted by Capt. G. W. Gathergood, secured the following 18 official British records, certified by the Royal Aero Club.

Distance in a Given Time—Closed Circuit.

Time Hours.	Distance Kiloms.	Distance Miles	Kilometres per Hour.	Miles per Hour.
¼	57.09	35.47	228.36	141.89

A SUCCESSFUL CLUB.

It is stated in the "Aircraft Journal" of Sept. 20th that the Aviators' Club of Pennsylvania had only been formed one month. In that time 300 former Army, Navy, and Marine aviators had joined. At a recent meeting it was decided that they would not merge with the Aero Club of Pennsylvania.

Arrangements are being made to obtain several aeroplanes and to place them at the disposal of the members of the club. Pilots only are accepted as active members.

WESTLAND

If you are visiting the Paris Aeronautical Exhibition we shall be pleased to show you the Westland "Limousine" on Stand 20.

We shall also have another machine at Le Bourget Aerodrome for giving demonstration flights.

Above is illustrated the model we intend to exhibit. The first machine, which has been flying since last July, has proved an ideal machine for mail carrying or passenger transport-de-luxe.

For full particulars and arrangements as to trial flights apply to our London Representative, **Lieut.-Colonel C. H. MEARES**, c/o MESSRS. PETTERS LIMITED, 6, DEAN'S YARD, WESTMINSTER, LONDON, S.W.1.

GREAT BRITAIN.

CIVIL AERODROMES.

The Air Ministry announced on Nov. 22nd that the following lists of aerodromes are issued as an addition to or amendment of the lists already published.

LIST A.—Service Stations only available for Civil use in emergency.

AMENDMENTS.

The following aerodromes have been transferred to List E, and are now published in that list :—

Aerodrome.	Nearest Railway Station.	Nearest Large Town.
Tangmere	Drayton	Chichester
Tresco (S)	Penzance	St. Marys

Reference : (S) seaplane station.

LIST C.—Aerodromes temporarily retained for Service Purposes.

AMENDMENTS.

The following aerodromes have been transferred to List E, and are now published in that list :—

Aerodrome.	Nearest Railway Station.	Nearest Large Town.
Collinstown	Portmarnock	Dublin
Crail	Crail	Crail
Ford Junction	Ford Junction	Arundel
Gullane	Gullane	North Berwick
Helperby	Brafferton	Ripon
Lincoln	Lincoln	Lincoln
Port Meadow (Oxford)	Oxford	Oxford
Tadcaster	Thorrer	Tadcaster
Throwley	Charing	Faversham
Upper Heyford	Lower Heyford	Bicester
Whitley Abbey	Coventry	Coventry
Witney	Witney	Oxford

LIST D.—Aerodromes licensed as "Suitable for Avro (504 K) and similar types of Aircraft" only. Except in very few instances, accommodation does not exist. The licences have also in the majority of cases been issued for limited periods only.

Aerodrome.	Location of Aerodrome.	Nearest Large Town.
Ipswich	Priory Heath	Ipswich
Kidderminster	Somerleyton Avenue	Kidderminster
West Timperley	Lies to N.W. of Timperley	Altrincham

LIST E.—Stations no longer in use by the R.A.F. These stations have been passed to the Government Property Disposal Board. They will be relinquished as soon as the Government property thereon has been disposed of. In many cases the aerodromes are now under cultivation, but it is probable that the sites still form the best emergency landing-grounds in the immediate neighbourhood.

Aerodrome.	Nearest Railway Station.	Nearest Large Town.
Anglesey (A)	Llangefni	Holyhead
Collinstown	Portmarnock	Dublin
Crail	Crail	Crail
Ford Junction	Ford Junction	Arundel
Gullane	Gullane	North Berwick
Helperby	Brafferton	Ripon
Hythe	Hythe	Hythe
Lincoln	Lincoln	Lincoln
Port Meadow (Oxford)	Oxford	Oxford
Tadcaster	Thorrer	Tadcaster
Tangmere	Drayton	Chichester
Throwley	Charing	Faversham
Tresco (S)	Penzance	St. Marys
Upper Heyford	Lower Heyford	Bicester
Whitley Abbey	Coventry	Coventry
Witney	Witney	Oxford

References : (A) airship station; (S) seaplane station.

THE CONTINENTAL AIR SERVICES.

THE AIRCO SERVICE.

The weather during the past week ended Nov. 29th has been consistently unfavourable for flying, although only three of the scheduled flights had to be abandoned.

Aircraft Transport and Travel, Ltd., have now completed fourteen weeks' flying on the London-Paris service as follows :—Flights scheduled, 213; flights accomplished, 177; prevented by weather, 19; interrupted by weather, 12; interrupted by mechanical defects, 5; number of miles flown, 48,090; average speed (m.p.h.), 104.

Date.	Type.	Pilot.	Left Hounslow	Arr. Paris.	Left Paris.	Arr. Hounslow.	Pass
Nov. 24th	D.H. 4a	Lt. McMullin	12.45 p.m.	3.10 p.m.			Ma
	D.H. 16	Lt. Lindley			12 30 p.m.	3 00 p.m.	2 and Mail
Nov 25th	D.H. 16	Lt. Powell	12.45 p.m.	2.55 p.m.			3 and Mail
	D H. 9	Lt. Bradley			12.30 p.m.	2.50 p.m.	1
	Breguet				—	3 50 p.m.	Mail
Nov. 26th	D.H. 16	Capt. Baylis	12.45 p.m.	2.55 p.m.			2

Nov. 28th	D.H. 16	Capt. Baylis	Thick fog		12.30 p.m.	Landed Lympne	1 and Mail
Nov. 29th	D.H 4a	Lt. Lawford	12.30 p.m.	Landed Wimereaux	Carbur	ettertrouble	2 and Mail
	D.H. 9	Lt. Robins	12.40 p.m.	3 30 p.m.			1 mechanic Mail
	Breguet				—	3.30 p.m.	

An improved wireless telephone installation is to be placed on the roof of the seven-storey building in Westminster, which is now the headquarters of the Aircraft Transport and Travel Company. Wireless telephones will also be fitted in the aeroplanes, and it will be possible to receive messages from pilots while they are actually in flight between London and Paris.

The regular operation of a wireless telephone service, not only between aeroplanes and terminal points, but also between aeroplanes and alighting grounds, will enable the flight of machines between London and the Continent to be signalled stage by stage as is the progress of a train. In the head offices of the company in London will be installed a special map of the Continental routes, with small model aeroplanes attached to it; and mechanism will be provided whereby the position of these aeroplanes can be changed from hour to hour, by the wireless operator on the roof, according to the messages he receives from aircraft in flight and from land stations. Thus it will be possible, at any time, to see at a glance the position of the aeroplanes which are actually in flight.

THE HANDLEY PAGE SERVICES.

Despite fog, rain, and snow, 154 passengers and 19,990 lb. of goods were carried during November on the London-Paris and Brussels air services. The number of flights made in the best previous month was beaten by four.

LONDON-PARIS.—Nov. 24th, four passengers and 510 lbs. of freight were carried.

Nov. 25th, six passengers and 400 lbs. of clothing were carried.

During the week ending Nov. 26th, fifteen passengers and 1,342 lbs. of freight, including Christmas cards to Paris, were carried.

Nov. 28th, Lieut. Blake flew from Paris to London with passengers and freight. Fog was encountered along the entire route.

THE AIRCRAFT MANUFACTURING COMPANY LIMITED
AIRCO
HENDON LONDON N.W.9.

Chairman and Founder (1911): G. HOLT THOMAS

The Largest Aircraft Enterprise in the World

THE Aircraft Manufacturing Company, which with its associated Companies, is the largest aircraft enterprise in the world, is in a unique position to undertake the construction and complete equipment of aircraft for every kind of commercial, scientific and administrative purpose.

While many firms are dependent upon outside industries for essential parts of their output, the vast Airco resources and experience enable the associated companies to carry out practically every phase of modern aircraft construction in their own works and under their own skilled supervision. The importance of this fact will be appreciated by those responsible for the inauguration and development of public air services.

Among the highly specialised products of the associated Companies are:

HIGH-SPEED AEROPLANES, AIRSHIPS AND KITE BALLOONS, SEAPLANES AND FLYING BOATS, AERO-ENGINES, PROPELLERS, INSTRUMENTS OF PRECISION, etc., etc.

THE AIRCRAFT MANUFACTURING CO., LIMITED.

AIRSHIPS LIMITED. GNOME & LE RHONE ENGINE CO, (Peter Hooker, Ltd.),
MAY, HARDEN & MAY, Seaplane Base, HYTHE. INTEGRAL PROPELLER COMPANY, LTD.

London Offices: 25-27, OLD QUEEN STREET, LONDON, S.W.1.

Dressmakers, costumiers, and furriers frequently fly on the Continental air service with cargoes consisting of women's dress, which is carried in large quantities.

[Which seems a lamentable use for a service destined to higher purposes.—Ed.]

LONDON-BRUSSELS.—Nov 24th, two Handley Page biplanes flew side by side to Brussels, carrying 2,807 lbs. of clothing for Belgium.

Nov. 25th, two machines flew together from Brussels to Hounslow with cargoes of raincoats, boots and furs. The journey was made in four hours.

During the week ending Nov. 26th, twenty-two passengers and 5,094 lbs. of freight were carried.

There is an increasing demand for the conveyance of goods to Belgium by air, owing to the fact that by steamer or rail delivery takes three weeks, whilst by air the journey is accomplished in three or four hours. Over 10,000 lbs. of velvet, dress material, and bales of wool have been carried by air to the Belgian capital during the last fourteen days. To hasten delivery, Handley Page machines have been flying to and from Brussels in pairs, which is the first stage of a future scheme to run daily formations of commercial aeroplanes to carry freight and passengers on the Continental Air Services.

BOURNEMOUTH.

The Avro Air Carnival at Bournemouth, announced for Nov. 29th and 30th, has been postponed until Dec. 6th and 7th.

BROOKLANDS.

A correspondent writes :—

It is reported, on good authority, that the Sopwith Schneider Cup machine, fitted with a land under-carriage, has flown here at over 170 m.p.h.

It is said that the "Vimy" commercial machines which Vickers, Ltd., are constructing here for China, are being elaborately finished and fitted up, even to expensive silk curtains for the side windows in the fuselage.—J. F. S.

GLASGOW.

The British Science and Key Industries Exhibition of Glasgow made arrangements with the West of Scotland Aviation Co. for an aviation "spectacle" to be given on Nov. 29th. Capt. Reeve, of the company, whose headquarters are at Renfrew was to fly over the exhibition buildings and give a display of "stunt" flying. Tickets were to be dropped from the machine entitling the recipients to free admission to the exhibition, and others were to be dropped giving a present of £1 in addition to free entrance.

LONDON.

CRICKLEWOOD.—Handley Page Transport, Ltd., from the inauguration of civil flying on May 1st to Nov. 20th have carried 3,895 passengers and 27,465 lb. of freight. The total mileage flown was 50,150. This flying was accomplished without one serious mishap and includes long flights in rain, snow, fog and gales.

Among the passengers carried were H.M. The King of Greece, H.R.H. The Prince of Wales, and T.R.H. The Crown Princes of Roumania and Sweden. Lord Milner, the Lord Chancellor, Mr. Bonar Law, and the Emir Faisul of the Hedjaz.

The interior of the Handley Page passenger-carrying machine is silk lined and fitted with electric light and rose vases. There are gilt mirrors on the walls and dainty boxes containing wool for passengers who wish to plug their ears as protection against the roar of the engines.

NORTHOLT.—There is still a great amount of activity at Northolt aerodrome. The R.A.F. do a certain amount of flying on Avros and Bristol "Fighters," and also possess many other machines of varied type.

The Central Aircraft Co. are very busy, and some seven pupils are learning to fly on the Centaur biplanes. One of these machines, one believes the first to be built, is fitted with a 70-h.p. Renault engine and has been flown for some 80 hours by Mr. Herbert Sykes, O.B.E., including a voyage over South Wales.

The machine has now been examined by the A.I.D., who, forgetting that the strength of a chain is the strength of its weakest link, have demanded that several somewhat absurd alterations shall be made. The other Centaur machines are fitted with 100-h.p. Anzani engines and have a remarkably good performance, but are beaten on speed by the Renault.

The first large machine with two 160-h.p. Beardmore engines, which was built some months ago, flew very successfully until inspected by the A.I.D. During the inspection the tail of the machine was dropped heavily, and the fuselage was broken. It would be interesting to know whether the Department of Civil Aviation is responsible for damage done while machines are in its charge.

The second commercial machine is now being built, and has an enclosed cabin to seat eight passengers. The seats are easily removable and a considerable amount of freight may be carried. This machine should be completed in January next.

NEWCASTLE-ON-TYNE.

Owing to the number of passengers taken up at Middlesbrough last week, the Berkshire Aviation Co. have decided to prolong their stay and to postpone the start of the Newcastle flying week until Monday, Dec. 8th.

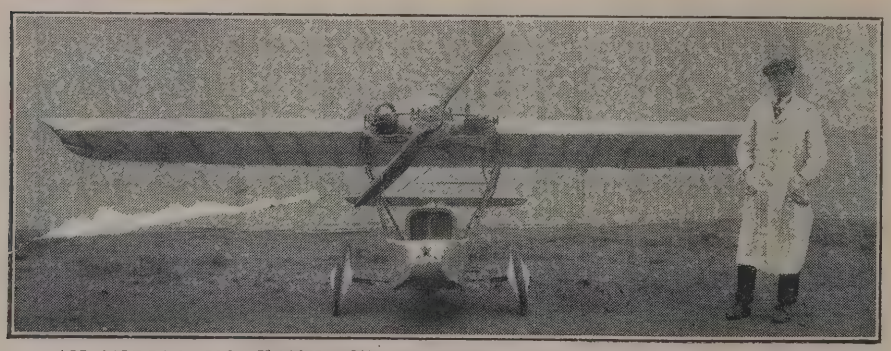
SHEFFIELD.

The Development Department of the Sheffield Corporation held a meeting on Nov. 27th to discuss the question of whether the manufacturers of Sheffield will co-operate with the civic authorities in retaining Coal Aston aerodrome as a civil aviation station.

Councillor Blanchard said that although Sheffield had been selected as a station on the national air routes, it was on a switch line from Nottingham, and if the Government decided to cut down the civil air stations the switch lines might be the first to go.

Lieut.-Col. Lockwood Marsh said that he understood that the Civil Aviation Department of the Air Ministry were anxious the Coal Aston should be maintained as Sheffield's aerodrome. Unfortunately they had no funds available to justify them keeping Coal Aston.

He understood that Vickers Limited intended to lay a scheme before the Development Department in a week or two. He was informed that the Air Ministry intended to bring before Parliament a short Bill which would authorise municipalities to acquire aerodromes with public funds. He believed that Leeds and Bradford contemplated participating in a joint scheme, and that Birmingham and Newcastle also had the matter under consideration.



The Chairman said the Development Committee were keeping the matter in hand, and would do all they could to encourage civilian aviation if the people of Sheffield supported such a proposal.

WESTON-SUPER-MARE.

As stated in a recent issue of THE AEROPLANE, the Urban District Council, Weston-super-Mare, refused an application from A. V. Roe and Co., Ltd., and the Warwick Aviation Co. for flying rights on the sands next year.

The matter was first considered by the Sands Committee, and a deputation representing the Golf Club and the residents in the South Ward waited upon them to protest against the granting of any concession. The main point made was that spectators had tramped down the bents and so caused a sand-drift, the removal of which would be an expense to the Golf Club, while mention was also made of the nerve strain suffered by certain residents through aeroplanes flying over their houses. The Sands Committee were evidently impressed, and by six votes to four decided to recommend that there should be no more flying from the sands.

When this recommendation was considered by the District Council, some opposition was manifested, and one Councillor alleged that the only reason for the objection to flying from the sands was that some golfers were put off their stroke. He said that exponents of the ancient game of golf were trying to crush the young sport of aeronautics. A letter was also read from the Avro manager, Captain Westgarth Heslam, stating that more than three thousand passengers had been carried during the season. His company was prepared, he said, to accept a site nearer to the River Axe.

AN AERIAL NOVELTY.—The B.A.T. "Crow" Monoplane, as described in "Aeronautical Engineering" this week.

ILLUSTRATED ON THE LEFT IS THE NIEUPORT NIGHTHAWK FIGHTING MACHINE. ON THE RIGHT IS THE SPECIAL CIVILIAN 2-SEATER MACHINE.

Ultimately the Council accepted the recommendation of the Sands Committee by eight votes to four.

It will therefore be necessary for aircraft companies to consider the acquisition of inland aerodromes for next year if flying is to be continued at Weston. That flying is popular with the people of Weston is shown by the number of passengers who booked flights during the season. Also, the interest of a still wider public is proved by the complaint of the Golf Club about the crowds.

CANADA.

The aeroplane, Pathfinder II, piloted by Mr. W. H. Brown, and with a passenger, left Victoria on Oct. 2nd for a voyage to the United States of America. The flight to Puyallup, a distance of 110 miles, was completed in 95 min. After giving exhibition flights at the fair at Puyallup, the machine was detained for a few days by the Custom authorities on a technicality.

The machine then proceeded to Friday Harbour in the San Juan County. Two photographic flights and a message-carrying flight to Anacortes were made from Friday Harbour. Several persons were taken up, including two trips of two passengers at a time.

The Pathfinder left Friday Harbour at 6.45 p.m. on Oct. 5th in thick mist and rain. Without a compass, and flying at 500 ft. in the clouds, the pilot landed safely at Victoria at 7.10 p.m. in the dark.

Recently a flight was made from Victoria to Seattle in 65 min., a time which created a record. In the first clearance certificate issued to the aeroplane at Seattle it was treated as an automobile, and the following questions had to be answered: Has the machine a wind-shield? Yes. Has it a top? Yes. License number ——. Number of cylinders? Eight. Tail light? No. The document was so unique in regard to aircraft that the Aerial League have had it photographed and a record is being kept of similar "clearances."

An aerial camera of the regular Royal Flying Corps type has now been fitted to Pathfinder II, and many pictures of the surrounding country and towns are to be taken.

SOUTH AFRICA.

Capt. S. Wood, the representative of Handley Page, Ltd., is in Cape Town preparing to establish an aerial passenger and mail service throughout South Africa, and to that end he is obtaining a number of machines from England. The daily service is to be between Cape Town, Pretoria, Johannesburg, and Durban. The complete journey from Cape Town to Johannesburg, including stoppages at Kimberley, Bloemfontein, and possibly other places, would occupy approximately thirteen hours. Exhibition flights will be made in Cape Town and other towns, before the service is started, to accustom the South Africans to aviation.

THE ARGENTINE.

It is reported from Buenos Aires that the French Air Mission is proving quite successful and so far there has been no accident. Passenger flights are being made in Farman Limousines and Bréguet Coupés three times a week. Up to Nov. 22nd two hundred and fifty passengers had had flights in aeroplanes and four hundred in gliders. [Presumably hydro-plane boats with airscrew drives are indicated by the word "gliders."—ED.]

The French Aviation Mission have organised routes for aerial services in the Argentine. It is hoped that an inauguration flight will soon be made.

BRAZIL.

The Brazilian Aero Club intends at an early date to organise two aviation schools for civil use.

The existing seaplane school is increasing in size. It is at present almost entirely equipped with American aeroplanes.

An Italian company intends to open a seaplane service between Rio Grande do Sul and the Amazon.

The Aero Club of Brazil has encountered the difficulties and confusion arising from the absence of a standardised system of aeronautical nomenclature, which is identified by the fact that the majority of aviators in Brazil have been trained in various countries abroad and have imported the aerodrome slang of the place of their apprenticeship. A committee has, therefore, been appointed to draw up a Brazilian glossary of aeronautical terms.

FRANCE.

THE PARIS-MELBOURNE FLIGHT.

M. Poulet arrived at Karachi on Nov. 11th, after a journey of 29 days from Paris, of which 12 days were lost through bad weather. He left Karachi a day or two later for Delhi, but had to land at Nasirabad, half-way between Karachi and Bombay, owing to the oil tank becoming unsoldered.

M. Poulet arrived at Calcutta on Nov. 26th, and left for Akyab (Burma), on Nov. 28th.

GERMANY.

AERIAL POSTAGE STAMPS.

Two types of postage stamps have been issued in Germany, a 10-pfennig orange and 40-pfennig green. The stamps are inscribed Deutsche Flugpost. The designs on them respectively are a winged posthorn and an aeroplane in flight.

GREECE.

THE BRITISH INDUSTRIES EXHIBITION.

A note from the Federation of British Industries states that the Exhibition of British Industries at Athens, which opened on Oct. 14th, closed on Nov. 23rd. H.M. the King of Greece manifested the very greatest interest in the Exhibition from its start to the final closing. He paid continual visits to the Exhibition, and his interest has been reflected through all classes of the Greek commercial community.

Intense interest was shown in the flights by the Handley Page machine over Athens. Although definite figures are not yet to hand, there is no doubt that this was a very popular feature of the Exhibition, and that large numbers availed themselves of the opportunity of a flight.

The Greek community in general were very kind in extending constant hospitality to the exhibitors, and the officials of the Federation of British Industries responsible for the Exhibition. At all these gatherings expressions of goodwill and sympathy towards the British nation and the British manufacturing community were frequent.

The business community of Serbia, Roumania, Constantinople, Smyrna and other Near Eastern and Balkan centres arrived in large numbers. It is estimated that 100,000 people visited the Exhibition.

THE HANDLEY PAGE AT THE EXHIBITION.

Capt. William Shakespeare, M.C., writes from Athens:—"I have the pleasure to report the successful completion of the first civilian trans-Europe flight. I arrived at Athens after the most trying and unpleasant stage of the journey from London. Taking advantage of what seemed to be good weather at Valona, I left in the early morning, and made quite good time, under good conditions, to Prevesa

"Shortly afterwards I landed at Tatoi, having done the journey from Valona in 4½ hours. This, I was afterwards told, was a record time. The people—Greek and English flying officers—were very surprised to see us, as the weather had been practically impossible all day; in fact, five minutes before we landed, an R.A.F. Handley Page machine, securely picketed, had been picked up by the wind and blown completely on its back, being a nasty mess of wreckage, which was spread out in front of us.

"Needless to say, after the buffeting I had received, I was greatly relieved to make our final landing; in fact, we were all pleased with ourselves at the successful completion of this long journey, although it had taken longer than we expected. This fact was due to conditions over which I nor the mechanics had any control. Altogether, the machine had been out in six whole days' rain. The engines, with the attention they received, stood very well

"On the day fixed for the inspection by H.M. the King of Greece, the Press turned up in copious numbers. We initiated them in the mysteries of the H.-P. and trans-Europe flight. I did two flights of Press people over Athens, and all went home very pleased with the machine, the new 'sensation,' and themselves. On these trips we did some pamphlet dropping over the city. Saturday, Nov. 1st, was a memorable day, for H.M. the King of Greece turned up and inspected the machine. He was greatly interested, and finally I persuaded him to come up for a flight. Since that occasion His Majesty has had two further flights, the last trip being from Athens to Corinth."

HOLLAND.

Mr. Fokker is said to be arranging a flight from Holland to the Dutch Indies, with Lausanne as the first stopping place.

ITALY.

The Italian correspondent of THE AEROPLANE writes:—

RAISING RECORDS.

Sérjt. E. Luit on the Marchetti-Vickers biplane has been trying for the speed record as well as the climbing record. On Nov. 20th, at the Monte Celio aerodrome, Rome, he raised his own February record of 260.8 kilometres per hour to 274.2. The weather was wet and the machine according to its designer not quite *au point*. Ing. Marchetti has not resolved the propeller question to his satisfaction, according to one of the dailies whose correspondent is usually well-informed.

THE ROME-TOKIO FLIGHT.

Reports of the start for Tokio being imminent are widespread, and it seems a fact that Gabriele D'Annunzio is to be at Rome before the end of the month.

(*Continued on page* 1871.)

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

In a note on the future development of aero-engines M. S. M. Viale suggests that the multitudinous poppet of the standard type of aero-engine could be replaced by a simple rotary sleeve valve, and that for horse-powers of 1,000 or so the Diesel type of engine is almost immediately practicable.

The Aeroplane's Danish correspondent has extracted from some of the German journals a series of interesting reflections on war-time practice. These will be found of considerable interest.

The call for engines specially designed for seaplane work is instructive, and the notes on practical war-time experiences with multiple-engined "Giant" aircraft are worthy of note.

The B.A.T Co.'s "Crow"—a diminutive machine of unusual design—is described and illustrated in this issue. To a certain extent the "Crow" resembles the famous Santos Dumos' "Demoiselle' of 1909, but the extreme simplicity and robustness of the design render it a noteworthy example of modern practice.

FUTURE DEVELOPMENTS OF AERO ENGINES.

By S. M. Viale.

Present-day aero engines, as developed during the war, have reached a fairly high standard of efficiency and reliability, and one may safely assert that they will be quite satisfactory for commercial purposes. As regards wear, conditions would be materially improved simply by slightly reducing the speed; the weight per h.p. would, of course, increase, but the life of the engine would be lengthened in much greater proportion.

Against the present standard system of high-powered aero engine (Vee, water-cooled type), there is, however, a very strong objection; excessive complication, leading to high manufacturing cost and decreased reliability. Many engines look complicated at first sight; some look simple and compact only because complication is, wisely, hidden under protecting covers.

One important reason for complication is the number of cylinders, as the power per cylinder cannot go over a certain figure without increasing the weight-power ratio owing to the limited piston speed. Very little can be done towards simplification on this side, except on some quite different principle.

Valve Limitations.

A second limiting condition which makes for complication is the number of valves, quite independently of the number of cylinders.

Roughly speaking, it does not seem possible or practical to get more than 15 h.p. per valve, at the best. As each valve requires at least five parts, if a 1,500 h.p. engine is wanted it will require 100 valves, and at least 500 small parts, all of them vitally important. It is useless to have a stiff crankshaft and a perfect lubrication if the engine will stop for a broken spring or a missing cotter-pin or a badly screwed nut, and there are one hundred of each. Supposing everything is well, think of grinding 100 valves and of overhauling the corresponding gear!

A solution which would give a real simplification is the adoption of the sleeve valve; all the objections that were made when the Knight system was suggested for car engines will be raised against the adoption of a similar system for aero engines, but one firmly believes that the practical result will be exactly the same. Instead of discussing, some enterprising firm will make an engine, and after careful (and probably long) testing, it will be a success. The chief objection would possibly be the excessive oil consumption; a large oil circulation is necessary, but this does not necessarily mean large consumption.

However, it is thought that the best solution, at least, in rather large engines of the Vee type, is not to be found in two or even one reciprocating sleeves, but in a rotary sleeve. This was suggested in 1910 by Mr. Butler, and if one remembers well an engine of the same type, single cylinder, for a light car was made, if not actually put on the market, in 1908 or 1909 in France. These particular engines were not, so far as is known, very successful. In the case of the French engine at least, the chief drawback was the rotation of the piston-rings. But this difficulty can be overcome, and there is no impossibility in the realisation of an aero engine of this type. The simplicity of the system is well worth a fair trial.

Rotary Valve Possibilities.

A steel sleeve rotating in an aluminium cylinder and driven by helical gearing will replace all the small parts of the ordinary timing gear. A slight reciprocating motion must probably be imparted to the sleeve in order to avoid the wear taking place in some definite portions of the cylinders. This will only require a fixed roller engaged in a cam cut in the sleeve; this roller with its pin, one skew pinion on the distribution shaft and the sleeve itself will supersede four valves, and, perhaps, 30 small parts of the standard type of distribution.

There will be only one shaft between the two lines of cylinders, and it will be much easier to drive; and all motions are smoother and without shock. In very large cylinders which would require six valves, it will be possible to increase substantially the dimensions of the ports by giving the sleeve a composite movement; uniform rotation, and harmonic angular motion superposed, the latter obtained by a harmonic sliding motion of the driving pinion on the distribution shaft. But for cylinders up to 7½ in. bore, uniform rotation of the sleeve will provide quite sufficient port area.

In the appended table some data are given for four engines of this type, two of them of the air-cooled type, as it seems possible to adopt this system of cooling, owing to the uniform temperature obtained through the rotation of the sleeve. Weights, of course, appear slightly greater than for the "Liberty" engine, given as a term for comparison; it must be remembered, however, that these engines were calculated for a low and commercial number of revolutions.

Even if the sleeve will simplify the engine itself very much, it does not allow of increasing the power without increasing, proportionately, the number of cylinders. There are now, flying or building, aeroplanes of 2,400 h.p., which represents six engines, 72 cylinders and . . . some valves. The time seems ripe for the 1,500 or 2,000 h.p. engine, either for aeroplanes or for airships. Taking 60 to 80 h.p. per cylinder, which is probably a maximum for engines of the accepted type, this means 24 to 30 cylinders. We think that this num-

ber is excessive; at any rate, it would be a boon if it could be reduced.

The simplest idea is to adopt the two-stroke cycle; but in order not to lose any precious fuel we are led to do the scavenging with pure air; hence to the Diesel principle.

As no Diesel has been made weighing less than some 50 lb. per H.p. (unless the report of a German Diesel aero engine, of which we heard something months ago, be true), conservative people will say that it cannot be made light. The same would certainly have been strongly held 25 years ago by any responsible maker of petrol engines if asked if it was possible to get one h.p. for, say, 10 lb. The truth is that no Diesel engine has ever been made with the modern materials now used in aero engines, and designed by a brain with flying tendency, if we may say so.

Ordinary Diesel engines work with only 100 lb. mean effective pressure, stationary petrol motors as well as gas engines work with some 60 lb. M.E.P.; we have now got 125 lb M.E.P. in aero engines, which is the double of the standard commercial figure. One hundred lb. is by no means a limiting figure for Diesel engines, Sulzer Brothers having obtained 177 lb. indicated pressure in their Diesel locomotive tested in 1914. Theoretically, by using exactly the quantity of air required for the complete combustion of the fuel it is possible to obtain in a two-stroke Diesel cylinder slightly supercharged as much as 180 lb. M.E.P.; with about 1/5 excess air 160 lb. are obtained. This does not take into account the work absorbed by the scavenging pump.

It may be objected that it is difficult to run a Diesel engine at high speed; but speed limits have so much increased during recent years that this is not a very strong objection. "Fiat" Diesel submarine engines are already running at 600 revs., and nothing proves that this is the highest possible speed.

In aero-engines it would be necessary to reach from 900 to 1,000 revs. This will prevent using both the hot bulb system and injection of fuel without air, as in these cases the initial combustion is more or less localised and cannot be spread with sufficient velocity. The best plan seems to be to spray the fuel with supercompressed air taken from the cylinder itself, without any independent compressor. Thus the fuel will be injected by hot air and the combustion will be very rapid. The apparatus required is not complicated and can be made with only two moving parts, including the fuel regulator.

As regards scavenging, two solutions are possible; reciprocating double acting pumps or turbo-compressor. Although less efficient, the latter is probably the best, as it is much lighter and does not require attention or lubrication.

Cylinders can be made either with double ports, for exhaust and scavenging, or with valve scavenging. The latter, again, is to be chosen if a high speed is required; double ports could be adopted only if the speed, for particular reasons and disregarding the increase of weight, could be reduced to some 700 or 750 revs.

The weight of an engine does not increase in exact proportion as the maximum pressure developed, as often the strength of parts increases more rapidly than the weight. Anyhow, present engines, for a M.E.P. of, say, 125 lb., are calculated for a maximum pressure of 450 lb., which governs the dimensions of parts. A Diesel engine with a M.E.P. of 160 will have a combustion pressure of 500 lb., although in a sudden explosion the pressure may reach anything up to 1,500 lb.; but with a well-devised safety valve it is possible to reckon on a maximum emergency pressure of about 850 lb. The ratio between maximum and mean pressure is then 3.6 for standard engines and 5.3 for Diesel engines. The weight, roughly speaking, would be increased by about 35 to 40 per cent. Whether this can be accepted is an open question; but for very high-powered engines there seems to be no other choice.

This increase of weight has been taken account of in the weights given in the appended table for Diesel engines. Figures for two-stroke, both with a turbo-compressor and with reciprocating pump, and four-stroke are given. The latter engine is not only much heavier, but requires four or perhaps six, valves per cylinder, half of which are exhaust valves. Three valves per cylinder are also necessary in the suggested two-stroke engine, but these are inlet valves and need much less attention. In this case we should have three inlet valves for about 165 h.p., which is a much better proposition than 12 exhaust and 12 inlet valves for 400 h.p. as in ordinary engines of the present time.

The Diesel two-stroke engine would not be interesting for less than 1,000 h.p.; but for larger engines the following advantages will more than compensate the difference in weight.

(1) Simpler engine, as the power per cylinder will be much larger, 250 h.p. per cylinder being a possible proposition.

(2) Lower fuel consumption, even taking into account the power lost in scavenging.

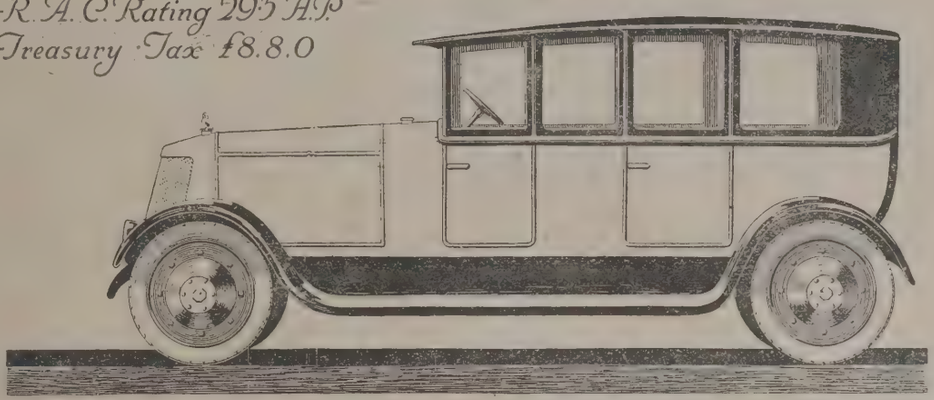
(3) Greater safety against fire, paraffin being used instead of petrol.

(4) Quality of fuel indifferent; can be run on crude oil, vegetable or even animal oil if necessary. Most important in colonies and desert countries.

(5) No electric ignition. This advantage is apparent when one thinks of the wiring of a 32-cylinder double-ignition engine.

(6) Engine can be easily reversed both for manœuvring airships and for braking big aeroplanes when landing.

(7) If the turbo-compressor is adopted, the power output is practically constant at any height up to 5,000 or 6,000 feet. Although not as important as in war time, this advantage is not to be despised even for commercial aviation.



In conclusion, one is firmly convinced that, barring air-cooled radial engines (offering an alluring solution both for small cheap power plants and for large ones too when the question of weight is paramount, as in fast military machines), the development of aero engines should be directed towards the adoption of a rotary sleeve as distribution organ for powers up to 1,000 or 1,200 horse; but from 1,000 h.p. upwards the Diesel two-stroke engine with turbo-compressor scavenging offers the best and probably the only possible solution.

The ARMSTRONG SIDDELEY *Six Cylinder Car*

R.A.C. Rating 29·5 H.P.
Treasury Tax £8.8.0

Saloon Double Phaeton (as illustrated) £1,000.

Public opinion at the Olympia Show unanimously endorsed our statement that you cannot buy a better car than the new Armstrong Siddeley 6-cylinder. It is a motor carriage of high efficiency and ample power, constructed of the best materials. It is light. It is comfortable. It is dependable. It runs smoothly, silently and is easily managed. Maintenance costs are small. Three years' free inspection.

LONDON PRESS OPINIONS.

"This 'Armstrong Siddeley' is as good value as is now to be had. Many people will be attracted by the novel appearance, which gives an immediate impression of ample power and great sturdiness."—*The Times.*

"This is the cheapest car in the high-powered class in the Show, being sold complete with elaborate coachwork for little if any more than the pre-war chassis price of vehicles of this power. I know of no other example of which this may be said."—*Morning Post.*

"A fine car which stands alone in respect of being of the high-class and comparatively big type and nevertheless produced on quantity lines. At £720 the chassis it does not sound cheap according to pre-war standards, but when contrasted with the current prices of cars of equal quality and many of less power, the figures are amazing, and I believe there will be a run on the new English product."—*Daily Chronicle.*

"Embodying in its graceful lines all that is best in aircraft-cum-motor-car practice, this promises to be one of the most notable cars of 1920, and is certainly one of the best value-for-money propositions on the market to-day."—*Daily Graphic.*

"Its high power in relation to the weight as a whole should render it economical in fuel consumption and tyres. Consideration for the owner-driver is manifest in numberless small details which tend towards increased driving comfort, ease of maintenance, and enhanced comfort of passengers."—*The Daily News.*

"The 'Armstrong Siddeley' is a true post-war design of luxurious character which has been fashioned mainly to meet the requirements of the owner-driver for town and country use. Elegance and general efficiency is the keynote throughout."—*Westminster Gazette.*

"The car is absolutely new at every point, and is unique from the fact that, though it is high quality product, it is also built by quantity methods. The general appearance of the car is dignified, and it makes a welcome addition to the list of high-class British cars at an exceedingly low price."—*The Globe.*

"The 'Armstrong Siddeley' have incorporated a great deal of their aircraft experience during the war in their new model, which is designed to be a quantity production job of the highest class. It is obviously one of the best values for money at Olympia."—*The Sunday Times.*

Godbold's

GERMAN POST-BELLUM REFLECTIONS ON WAR EXPERIENCES.

By ERIK HILDESHEIM, B.A., Copenhagen.

The technical aero journals of each of the former belligerent countries in their trade reports bear witness to the general eagerness to make the accumulated experiences of the war period universally known both with a view of claiming priority for new ideas and of showing the national interest to the best advantage.

So far as Germany is concerned the underlying idea in reviewing the work of the various aircraft firms is to illustrate how far German developments had gone in the various lines now that the end of the war may deprive the works for some time of the necessary means for going ahead experimentally.

The general condition of Germany may even foster commercial aviation beneficially in so far as cost proves not to be prohibitive, owing to the breakdown of other means of transportation. The delivery of their aircraft stores to the Allies leaves the Germans without inducement to convert existing war material, and they are thus free to discuss and enter upon the best lines for future development.

As the latter are best shown by commenting upon the past, the following news for which the source of information is given in each instance, may claim interest.

The Professor of aero engine design at Charlottenburg, himself the chief designer to the Mercédès firm, stated that beyond tempering before machining, heat-treatment of crankshafts for aero engines had now been abandoned in Germany.

The after treatment only increased the resistance of the shaft to repeated shocks, and as a life of 100 hours could be relied on from the untreated shafts, it is presumed that the saving in the time of production justified the step.

In this connection it is of interest to note the difference in the physical characteristics of the crankshafts of the 260 h.p. Mercédès and the 230 h.p. Benz engines, and that of the Basse-Selve engine, given in the British official reports on these engines. These are :—

	Ultimate Tensile stress Tons per sq. in.	Elongation on 2 inches %	Yield point Tons per sq. in.
Mercédès	62	13·5	55·7
Benz	62.5	21·3	55·2
Basse-Selve	55·5	19·5	44·5

It may be assumed that the Basse-Selve engine is a case of the untreated crankcase, the two earlier types showing the earlier practice.

The same Professor also stated that the Germans experimented for one year with copying the Rolls-Royce reduction gear, experiencing troubles from steel failures. Which should be read in conjunction with a statement by Naval Lieut. von Dewitz in a paper read before the German Aero Club that at one period the German Naval Air Force had difficulties in opposing the British opponent, owing to the Rolls-Royce motors in use there. The Hispano-Suiza reduction gear was also experimented with, the gears, however, failing after a few hours' running.

In an article by Marinebaumaster Fuhrberg, Berlin, asking for the development of a special motor for seaplanes in "Der Motorwagen," various well-known aero-motors are dealt with from the seaplane point of view.

The author first states that owing to lack of material German aero designers could not cut weights to such limits as their opponents, and that the works, having quantity production as the chief aim, had but small chances for experimental developments.

In fact, the Germans started with the Mercédès for their land-going and Benz aero-engines for their naval aircraft, which models remained favourites all through the war, and except for the introduction of three more makes of the same 6 cyl. vertical type (Opel, Selve and Maybach, the latter, as developed from the airship version), and the old favourite Argus of same type, only two new engines arose from the special needs of aerial warfare.

These were the B.M.W. (Bayern) motor and the Siemens 11-cylinder rotary.

To overcome the disadvantage of the high initial weight of the German engines, every effort was made to reduce the fuel consumption. As the most effective means super compression was chosen, which was driven almost to the limit of possibilities. For this reason the German aeromotors were too heavily built to attain good altitude flying.

Further arrangements for reducing the fuel consumption were a favourable designed form of the cylinder head, preheating of the gas mixture and attention to the carburetter, etc. Thus a reduction in petrol consumption to 185 grams per h.p. hour was achieved with the Bayern motor on test, and similar favourable results were obtained with the Maybach motor in airship service by the employment of a saving nozzle.

Low fuel consumption is, of course, of fundamental importance for long flights, and the figures for two German

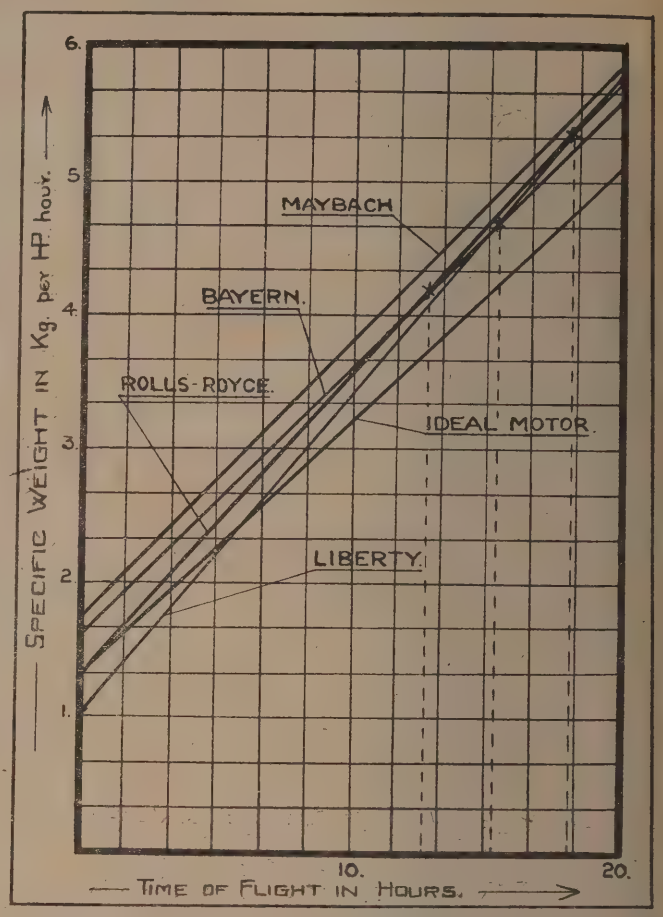

Chart showing total weight per B.H.P. of engine plus fuel for German and Allied aero-engines.

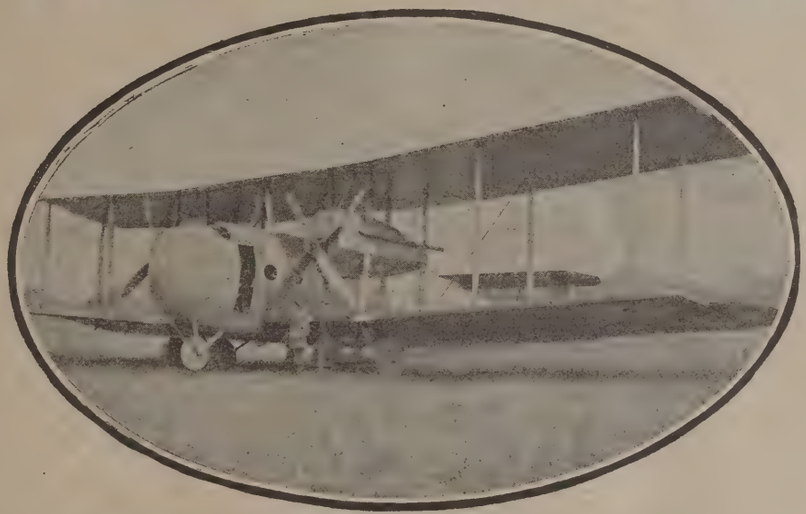
motors with special carburetter adjustment for sea flying are given together with two of the best enemy motors, viz., the 320 (350) h.p. Rolls-Royce and 400-h.p. Liberty.

It will be seen that the latter is the most favourable owing to the low engine weight up to flights of 15 hours' duration. At this point it crosses the curve of the B.M.W.IIIa. The Rolls-Royce motor is superior to the latter so far as about 13 hours' flight, though it must be remembered that the former is provided with a reduction gear, which improves the screw efficiency considerably. The Maybach IVa is absolutely the most unfavourable during the whole flying time.

The qualities required of the ideal motor for seaplanes include a super performance of 10 to 15 per cent. above the normal brake h.p. for about five minutes, as this increased power is needed to rise from the water, and the output should keep almost constant to an altitude of 4,500 ft., which is the normal flying height for seaplanes, and a petrol consumption of 190 grams per h.p. an hour, that of oil being left out of consideration as of little importance for the weight.

A further point commented upon is the radiator question, the author saying that a cooling area sufficing in flight will be insufficient for the oft-needed taxying.



It is mentioned that the Windhoff radiator, the normal one for German landgoing aircraft, turned out a failure for seaplanes, as leakages resulted from the mounting angles, and when the radiators had for some time to be made of iron sheets owing to lacking material, they got eaten away by rust in a few months.

Quoting an instance of the variation in conditions for land- and seagoing aircraft, the 195-h.p. Benz motor (model BzIIIa) is quoted. The magnetos were removed from the rear to the front above the reduction gear, which rendered the motor useless for seaplanes, as the sea spray hindered the function of the magnetos, and this could only be remedied at the cost of considerable weight, though the change was much appreciated for landgoing aircraft owing to the shortened length of the motor.

It is further stated that the conditions for seaplanes and giant aircraft are similar, the former having to avoid alighting in open sea, and the latter being unable to land outside specially-suited grounds, and as the writer believes that giant aeroplanes, for instance, above the present sizes will always

be equipped with floats. He intimates, by the way, that much danger was experienced in landing the giant seaplanes, wherefore petrol tank dropping experiments were entered upon in Germany, too, though from a different prime reason than the Allied fire-prevention efforts.

A paper, read before the German Aero Club by Lieut. Offermann, of the Reserve, can next be proceeded to for the information to be derived both with regard to details and to the history of the origin of German giant aeroplanes. It is both stated and illustrated how the first 3-engined biplane was built at the Gotha works to the order of Count Zeppelin, who, together with the Bosch firm, had been converted to the idea by the well-known German flying champion, Hellmuth Hirth, before the war, with a view to a transoceanic flight, and Count Zeppelin was induced to resume the project when an inventor offered him a 1-ton bomb capable of destroying the whole British fleet. Who would have neglected this statement without investigating its prospects? the German text asks with emphasis where one would have considered interrogation more appropriate. Count Zeppelin asked the assistance of Professor Baumann, as the best known aeroplane designer and of the technical director of the Bosch works, Klein, who lost his life together with the well-known pre-war pilot, Vollmoeller, in an experimental flight of the giant biplane; two other old-timers who gave their lives for the cause being Reichardt and Wittenstein.

The first Gotha-built Zeppelin Giant with three 240 h.p. Maybach engines.

The first giant was fitted with three 240-h.p. Maybach motors, one as tractor in the fuselage nose and two pusher plants, each in interplane engine nacelles, where later another motor was coupled to the other or drove a tractor screw. These German distributed drive giants were built by the Zeppelin works in Spandau and Staaken and by the licensees: Aviatik, Albatros, and Schütte-Lanz.

The first Siemens Steffen Giant Aeroplane.

The rest of German giant aeroplane types were provided with central power installation, viz., the Linke-Hoffmann 4-engined single-and twin-screw models, the 4-engined D.F.W. twin-tractor and twin-propeller type and the 6-motored 1,800-h.p. twin-screw and twin four-bladed propellered Siemens-Schuckert.

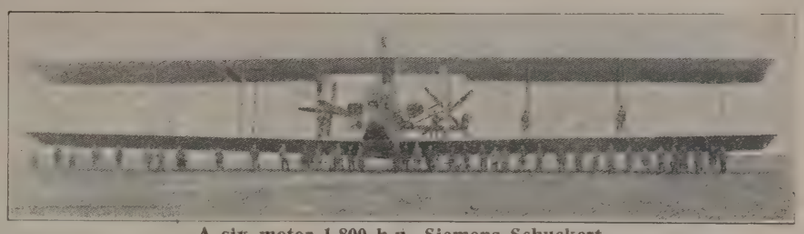
The first Zeppelin-Gotha was otherwise of normal design, of a span of 43 metres, weighed 6½ tons and could carry a useful load of 2½ tons, the 1-ton bomb hanging in a central body cage; all three engines drove through reduction gears. The first giant to be used on active service was R.12, in August, 1916, equipped with six 160-h.p. Mercédès motors. The first Siemens giant was built with the support of the firm's managing director, Secrete Chancellor Reichel, to the design of Engineer Steffen, under the supervision of Engineer Wolff, in Neumünster, 1914, flew to Johannisthal with seven passengers in June, 1915, and engaged on active service in the winter, its successors being employed, too, for school service. Great difficulties have been experienced with regard to insufficient lateral control, the first means of help being the Flettner auxiliary ailerons, while, owing to the Armistice the experiments planned by the giant aircraft inspection department, with a third pilot in form of a Servo motor combined with an automaton could not be carried out.

To raise the ceiling and increase the speed of the giants by maintaining the engine performance at high altitudes the R.30 aircraft was equipped with a turbo-blower supercharger, built by the firm of Brown, Boveri and Co., of Mannheim, to the designs of Engineer Noack (which may be the German aero turbine of rumours, equalling the French Rateau instrument comments). So far the ceiling of this Staaken biplane had amounted to only 11,400 ft., but on April 24th, 1918, an altitude of 18,000 ft. was reached, the speed being, at the same time, increased to 160 kilometres by the employment of adjustable airscrews to the design of Professor Reissner.

Further statistics and flight reports are quoted, as rendered hereafter. Twenty giant aeroplanes carried out 150 flights over enemy area, the distance covered amounting to about 50,000 kilometres, and 110 tons of bombs were carried. London was many times the object of the flights, those of greatest length going to Rouen and Le Havre.

The biplanes were often flown without intermediate landings from Berlin to the front station Gant in 7½ hours. R.33 reports of a flight to London that both engines of the left motor nacelle gave out, the front one stopping altogether, owing to the oil freezing. By cutting the tank and filling the motor by hand a landing in the sea was prevented.

R.25 reports:—Owing to some clips getting loose the left rear motor lost water; the clips were repaired and the engine continued running throttled. Then the motor lost several exhaust pipes, whereby the oil tank-covering was set on fire,

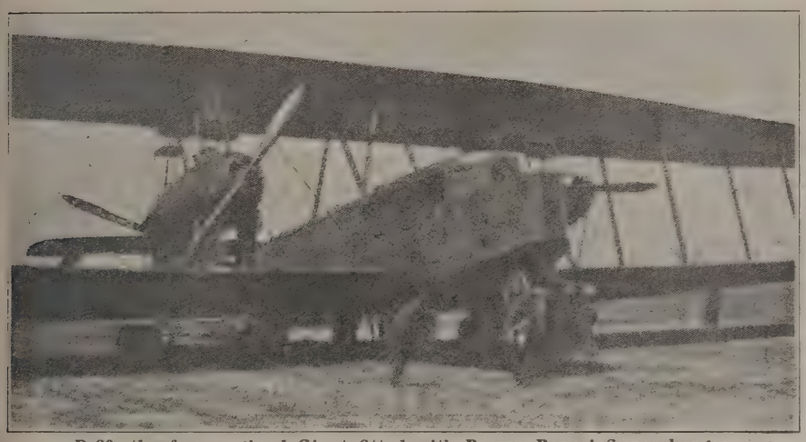


The airscrew drive housing of an A.E.G. Giant Aeroplane.

which was, however, extinguished, but the motor had to be stopped.

R.33 reports another time: A petrol pipe breakage and some ignition cables having come loose, but could be repaired in flight

R.13 report: A valve spring broke, the valve had to be lifted by hand on the whole return flight.



R.31 reports: Left rear motor stopped at the start, owing to non-circulation of the oil, yet the flight to Compiègne was carried out.

A six motor 1,800 h.p. Siemens Schuckert.

R.12 reports: The gear-drive in the left cabin broke and a fire started, which was extinguished during the flight. The landing was carried out safely with stopped left engine nacelle.

A fatal accident with R.21 was the result of a propeller made hurriedly to expedite front interests, that broke and caused the reduction-gear to break, whereby the cardan shaft got free and continued its eccentric movement, thereby destroying the plane, from which the accident resulted.

R.30, the four-engined Giant fitted with Brown Boveri Supercharger.

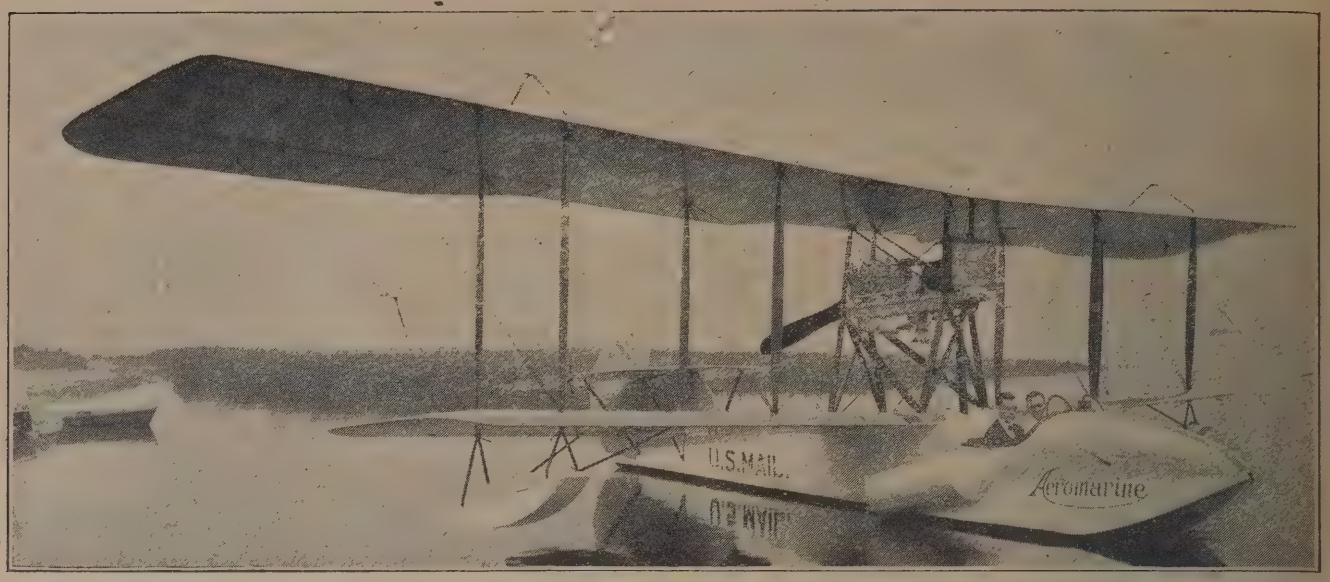
The weight of the instruments of a German giant aircraft is given as 500 kilos, 300 of which are, however, war equipment. This is naturally higher for aircraft with separated power units than for central power plant installation. The equipment includes tachometers for the number of revs. of engines and propellers, distance thermometers for the temperature of the radiator water and the oil in the motors and gears that must be kept constant, all in twin arrangement, first in the engine room, next in the pilot cockpit, electric transmission being generally adopted.

Of great importance are the means of communication, needing much improvement, long experiments with acoustic tools, like telephones, sirens, speaking tubes, having proved their uselessness for giant aircraft, as human hearing is, after long flying, unable to hear any more owing to the engine and propeller noise. Order transmission through a lens and prism system failed, as the orders written and projected on a ground glass screen blurred and got illegible. The engine telegraph has alone proved good, being in the latest form capable of submitting twenty orders, or even more by certain combinations. Special information is transmitted by means of a pneumatic mail tube as a supplement.

For night and cloud-flying the Drexel gyroscope position indicator is employed. The air speed is indicated to the pilot by either the Morell aneatachometer or by the Bruhn nozzle air current meter. The variometer tells the pilot whether the aircraft climbs or descends.

The value of the wireless receiving and sending plant, of a 600-kilometre capacity, is shown in the flight report of the commander of the giant aircraft squadron 501, reading:—

Report of the war flight in the night between August 24th and 25th, 1918, to B and C. "In favourable weather I started the flight to the aim, A, ordered by the 4th Army Headquarters, giving: Object, A; secondary object, B. Petrol was carried for 6½ hours' flight and 12 tons of bombs. The following giant aeroplanes participated: R.12, 13, 25, and 39. I am on board R.39. We were allowed to start after half-past 9 in the evening and must take the sea course, owing to the moonlight night, to avoid unnecessary losses. The barrier of the night scout region is felt to be a great hindrance, as the pointed-out route by the Dutch frontier means a considerable prolongation of the flight and holds in itself the danger of flying over Dutch territory. During the flight the weather conditions changed and the danger of fog had to be reckoned with from 3 o'clock in the morning. When I received this report by wireless, I made out by calculation that the aeroplanes could not be home before 3 p.m., and so ordered the squadron by wireless to attack B, this order being received by all aircraft. The ordered aim was attacked by three aeroplanes with three ½-ton bombs, with clearly observed good effect, while a fourth aeroplane had perforce to attack C, owing to engine trouble."



These reports from enemy sources clearly show that the accessibility of the power plant in the German central-drive type of machine possesses real advantages in the case of engine trouble. The report of repairs carried out in flight, extinction of fires, and so forth would in all probability have been entirely impossible in an interplane engine installation on a night flight.

[The note as to the R.30 being fitted with superchargers and with variable pitch propellers is of interest as showing the parallel lines of development in Allied and enemy countries.—ED.]

The Airscrew housing of a Siemens Schuckert Giant.

AERIAL MAIL DELIVERY TO SHIPS AT SEA.

The Aeromarine Flying Boat used for the mail delivery tests. The chute for the mail bag is seen on the side of the hull.

The following information as to a recent test of a method of delivering mails to a ship at sea has been supplied by The Aeromarine Plane and Motor Co., of Keyport, New Jersey.

As a means of expediting delivery of overseas mail, Mr. Otto Praeger, Second Assistant Postmaster-General of the United States, ordered the experiment of delivering mail by aeroplane to a ship at sea to be tried.

The Post Office entrusted the aerial part of the experiment to the Aeromarine Co., and with this end in view Mr. Uppercu, the president of the firm, started experimenting at his factory in Keyport. A number of plans were considered, but one suggested by Mr. Uppercu and thought most feasible by Pilot C. J. Zimmermann, was adopted. This consisted of trailing a weighted line about 200 feet long from the flying-boat. To the inner end of this line the mail-bag was attached, the idea being to entangle the trailing line in the rigging of the steamer, the release of the mail-bag taking effect as soon as the line became entangled. To try out this idea a 50-foot mast with guys, representing the rigging of a ship, was located on the beach at Keyport, and for a week daily tests were made until the apparatus used in the actual attempt was developed. It was found at the outset that to entangle the rigging and make the "tie" hold, more than one weight would be required.

A kind of cat-o'-nine-tails with seven tails was therefore adopted, five of the tails being of sash cord and two of steel cable, each being weighted by a bag containing one and one-half pounds of lead shot. The first attempt with this arrangement and a 100-pound mail-bag resulted in the parting of the main sash cord line. The cord was then replaced by five-thirty seconds cable and a half-inch strand rubber shock absorber. The trial resulted in breaking the shock absorber, and a larger one was substituted and two other shorter and heavier shock absorbers were added in the line, the line in this attempt being continuous to the bag. The mail-bag was carried in a built-up veneer chute firmly attached to the right-hand side of the hull of the flying-boat at an angle of 15 degrees slanting to the rear, the bag resting in it and being held by friction until pulled out from the open rear end by the cable when caught in the rigging.

Several attempts were made with this arrangement and the bag was found to be too weak. A heavily reinforced bag was then made and trials were continued.

It was found possible to hook the rigging on the stationary mast on every attempt, thus making a perfect score.

It was decided to make the actual trial by delivering mails to the White Star liner "Adriatic," which sailed from New York on August 14th, 1919.

Considerable apprehension was, however, felt as to the results with a moving ship, and this was by no means lessened by the fact that on the morning of August 14th the weather was far from favourable. Mr. Uppercu, however, decided to make the attempt and accordingly ordered Pilot Zimmermann to bring the boat to New York. After the necessary formalities with the Post Office officials, at which time Pilot Zimmermann and Mechanic Greisinger were sworn in as temporary messengers of the Post Office Department, the mail was placed in the special sack, taken aboard the flying-boat, and at 1.30 p.m., fully an hour after the sailing of the "Adriatic," the flight was started. Mr. Uppercu's yacht, the "Lounger II," had left the Columbia Yacht Club, New York, at 10.30 to be on hand to render any assistance necessary.

At 2.10 p.m., one hour and 45 minutes after the sailing of the "Adriatic," the mail-boat was encircling the ship.

A few seconds later the attempt was made, the cat-o'-nine-tails catching the forward stay, as planned, and the mail-bag dropping into the sea to be hauled aboard by the "Adriatic" sailors a few minutes later. Pilot Zimmermann made certain the mail was safely delivered and then flew home to Keyport.

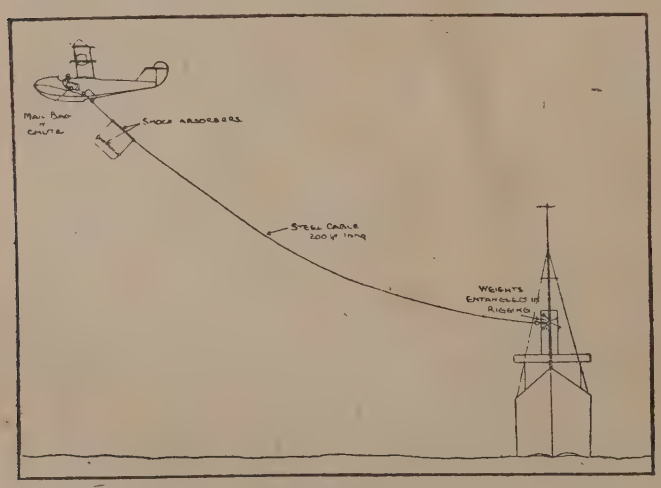


Diagram of the Aeromarine mail dropping device.

BRITISH INDUSTRIES IN SCANDINAVIA.

The Federation of British Industries has appointed Mr. Montagu Villiers to act as their Trade Commissioner in the Scandinavian countries.

Mr. Villiers has spent many years in the Consular Service, and lately in the commercial diplomatic service. He is well known in Stockholm, Copenhagen, and in commercial circles in Norway, and among other positions he held was that of British Consul at Stockholm from 1906 to 1913.

He speaks Norwegian, Swedish and Danish with the fluency of a native. The manufacturers of this country have been fortunate in securing his services.

Mr. Villiers was to leave for Scandinavia on the 25th inst., and he will make a tour of inspection, returning to England early in January next, when he will be able to make a report as to the economic conditions in Scandinavian countries, after which he will set up offices in Norway, Sweden, and Denmark.

Mr. Villiers will be accompanied by Mr. John Pitcher, who has made a special study of transport and trade conditions in various countries.

British Aircraft Constructors, please note.

AEROPLANE DOPE

FOR SALE BY PUBLIC TENDER.

The following quantities of Aeroplane Dope are available for disposal:—

18,292 Gallons Cellulose Acetate Dope.
7,252 Gallons Nitro Cellulose Dope.
1,834 Gallons Mixed Dope.
6,000 Gallons S.33 Dope Solvent.

The material is located at Coventry, Sheffield, Liverpool, Hendon and Farnborough, where it can be inspected in bulk.

Tenders are invited for the whole or part thereof.

All enquiries for information and tender forms should be addressed to:

The Controller, Aircraft Disposal Department, Welcome Club, Earl's Court.

(*Nearest Station—West Kensington—District.*)

Telephone: Western 4950. Telegrams: "Clearhouse, Aerosupply, London."

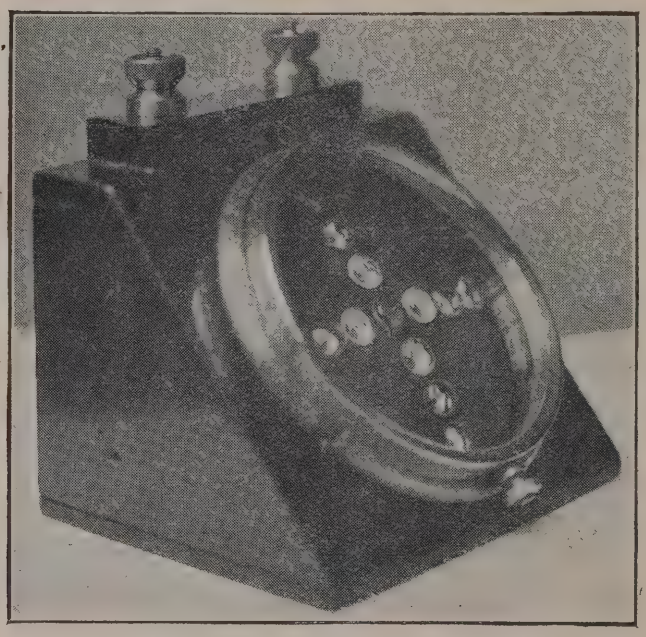
IMPORTANT.—Please note change of address from York House, Kingsway, to Earl's Court.

NOTE.—For further particulars of other Government Property for sale see "SURPLUS" price 3d., at bookstalls, or by quarterly subscriptions of 2s. post free, payable in advance to the Director of Publicity, Ministry of Munitions, Whitehall Place, London, S.W.1.

Above these main girders and towards their forward end a single-piece wing 18 feet in span is attached. This wing is built on two spars which taper in depth from the centre to the wing tip and which are sufficiently strong to support the wing loads without bracing wires.

Below the wing a long wooden skid is suspended from the main girders by six steel tubes and across the skid there is fastened a laminated wood axle carrying at its outer ends a pair of landing wheels. On the skid is built up the pilot's habitacle, consisting of a light wickerwork seat aft, and an arrangement resembling the fore end of a side-car for the reception of the pilot's feet.

The whole affair is extraordinarily simple—for instance, the wing may be removed for storage purposes by undoing 12 nuts and resecured by doing up again the same 12. There are no bracing wires to adjust and no trueing up to do.



The petrol and oil tanks are contained within a torpedo-form casing over the wing, and are attached to the engine mounting so that the whole power plant forms one unit and can be detached from the machine as such. The tank capacity is five gallons of petrol and ½ gallon of oil—sufficient for nearly two hours' flight or 130 miles.

The following are the chief figures relating to this machine :

Overall span	18 ft.
Overall length	14 ft.
Overall height	5 ft. 8 in.
Weight empty	265 lb.
Speed (maximum)	65 m.p.h.
Speed (minimum)	30 m.p.h.

THE CLAYTON CLINOMETER.

The instrument shown in the attached photograph embodies an extremely ingenious form of indicator of a type suitable for night flying. The instrument itself is a gravity controlled clinometer and it is so arranged that when the machine is on a level keel laterally or in any other position of no sideslip, and is also at its normal flying angle, a central small electric lamp coloured green is kept illuminated.

This green lamp is at the point of intersection of two rows of similar red lamps, which are caused to light up by any divergence of the machine from these conditions. The indication is extremely vivid and cannot fail to attract notice—which is by no means the case with the usual type of bubble clinometer.

This method of indicating could be applied to a number of instruments of varying types, and the inventor is open to receive offers to take up the British patent rights.

AN AMALGAMATION.

Arrangements have been completed for the amalgamation of the business carried on by Mr. Robt. W. Paul at New Southgate, London, with the Cambridge Scientific Instrument Company, Ltd. Mr. Paul will join the Board of Directors and the manufacture of instruments will be continued both at Cambridge and at New Southgate. Until the end of the year the selling and manufacturing arrangements will be unchanged, but on January 1st, 1920, the name of the Company will be altered to the Cambridge and Paul Instrument Company Ltd., and as soon as possible the Head Office and Showrooms transferred to London.

THE MARTINSYDE MOTOR-CYCLES.

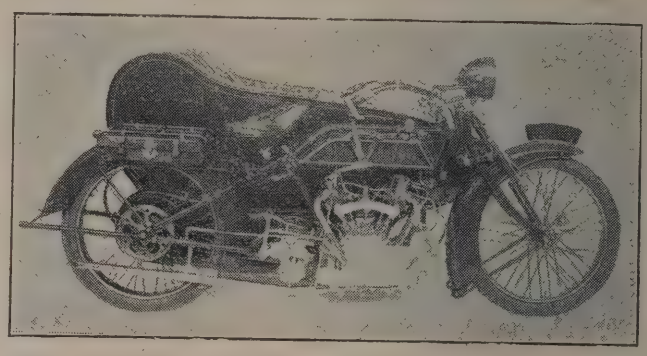
Like so many large aircraft firms who, since the signing of the Armistice, which brought with it the cancellation of all large aircraft contracts, have taken up the construction of sundry articles likely to be more in demand to a war-worn nation than fighting aeroplanes, Martinsyde, Ltd., of Woking and Weybridge, have turned their attention to the manufacture of motor-cycles on a large scale.

A brief specification of their 6-h.p. Vee-twin Martinsyde-Newman combination is as follows :—

Engine : 70 mm. bore by 88 mm. stroke, 680 c.c. 50 deg. twin cylinder. Overhead exhaust, and side inlet valves. Automatic lubrication.

Ignition : M.L. high-tension magneto.

Carburetter : Special two-lever Amac.



Gear Box : A.J.S. 3-speed countershaft with cork inset plate clutch and kick starter.

Forks : Brampton Biflex.

Tank : Square design , two gallons of petrol and ½ gallon of oil, with large filler caps, priming tap, hand pump and semi-automatic drip-feed.

Saddle : Brook's.

Wheels and Tyres : 650 by 65 Dunlop special.

Equipment : Includes carrier, two Brook's long pannier tool-bags, number plates, inflator, horn, oil can and spanners, separate stands to both wheels.

Side-car : Chassis specially designed for accessibility and quick detachment, 3-leaf Cee springs, large mudguard (well balanced), coach-built body with luggage carrier at rear.

Finish : Bicycle and side-car chassis enamelled black lined gold, all bright parts heavily plated. Side-car finished in Royal blue lined gold and upholstered in Royal blue.

A model has been on the road for some time and has been thoroughly tested, as the following letter given hereafter shows.

"After it had undergone a test of 5,000 miles we had the pleasure of personally testing the Martinsyde-Newman 1920 Combination for several hundred miles. We found it to be exceedingly speedy, an excellent hill-climber and, moreover, a very comfortable mount, and one that we highly recommend. "(Signed) J. L. and W. H. BASHALL."

Deliveries commence in January, 1920, and the makers state that there will be no increase on the present price of £170 during 1920.

THE TRANS-AMERICAN RACE.

The following letter has been received :—

Sir,—Some interesting data has just come to hand from Washington, D.C., in connection with the performance of the Rolls-Royce engined "Bristol Fighter" which was entered as a competitor in the recent American Transcontinental race and was piloted by Brig.-Gen. L. O. Charlton, C.M.G., D.S.O., the British Air Attaché at Washington.

This race started on October 8th last. The first day witnessed a number of accidents, amongst which was the forced landing of the above-mentioned "Bristol Fighter." Some misleading reports stated that the reason of the machine making a forced landing was due to engine trouble.

In response to our inquiries we have now received a letter from Brig.-Gen. Charlton reading as follows :—

"Many thanks for your letter of October 9th, and it was, as you say, a great disappointment for me to have been put out of the Transcontinental event at such an early stage, more especially as I consider that I had the best machine and engine in the race.

"It is not quite correct to say that I had carburetter trouble. What happened, actually, was that owing either to bad luck or bad management some water got in the petrol, with the usual consequences of a forced landing in not very favourable country. *I attribute no blame whatever to the engine,* and hope, in fact, to have it in the air again before many days elapse."

We venture to hope that you may be able to publish this communication. (Signed) For Rolls-Royce, Limited.

C. JOHNSON (Managing Director).

(*Continued from page* 1846.)

SOME NEW MACHINES.

From down South I am told of a very, very big seaplane on the stocks, as well as the three-metre biplane and a similar span triplane with 35 motor, previously mentioned. Still, one waits for the Government competition spoken of in the spring for these tiny flying things. I am told that the regulations are constantly being modified, and one constructor assured me that there is no call for a thing that will fly with 35 h.p., but would be infinitely more comfortable and comforting with 50.

THE U.S. AERO CLUB'S TOUR.

Secretary Augustus Post and Mr. Franklin Hunt of the U.S. Ae. Club are passing through Milan and other Italian cities on behalf of their organisation and in connection with the "Round the World" contest. They are not flying, but are busy choosing routes and assuring the co-operation of the Italian sporting authorities for the coming event. Comm. Mercanti met them at Milan and showed them the various aeroplane works and other places of interest in the city of Milan, not forgetting "Ceva"—not yet dry, or likely to be, despite American forced thirsts.—T. S. H.

JAPAN.

Further details of the aerial postage service Tokyo-Osaka are now to hand. The service, a distance of about 290 miles, was to have started on Oct. 4th. Prizes were offered in connection with the flights for the quickest successful round trip.

Unfortunately the weather on Oct. 4th was not favourable, and the next day it was worse, so the first air mail, for which 40,000 postage stamps had been issued and bought, went to its destination by rail. It was intended to renew the project on about Oct. 20th.

SWEDEN.

AN AERIAL TOUR.

Lieut.-Col. G. L. P. Henderson (ex-R.A.F.) reached Stockholm on Nov. 29th, from Copenhagen, on his own Armstrong-Whitworth biplane. The flight from Norrköping to Stockholm was accomplished in 55 minutes. He encountered heavy snowstorms and fog on the way, and had to land several times.

UNITED STATES OF AMERICA.

THE TRANS-ATLANTIC HANDLEY PAGE.

The four-engine Handley Page aeroplane, which was entered for the Atlantic Flight, piloted by Major H. G. Brackley, flew recently from Parrsboro', Nova Scotia, to Greenport, with twelve passengers, covering a distance of 600 miles in eleven hours. Hundreds of Americans waited half the night in the rain for the machine to arrive, the landing ground being illuminated with flares and searchlights similar to those which formed a beacon of welcome for the British airship R.34.

The flight was accomplished in wind, rain, and darkness, which made the task of Admiral Mark Kerr, the navigator, a difficult one. Whilst over New England coast in darkness and torrential rain the many lighthouses along the seashore were utilised as guiding landmarks.

A SEAPLANE HEIGHT RECORD.

What is claimed to be a height record for a seaplane was made on Sept. 30th last at Port Washington, Long Island, U.S.A., by Mr. C. S. Bragg, accompanied by Mr. C. J. Younger on a Leoning sea-monoplane. In 49 minutes from leaving the water the machine reached an indicated height of 19,100 ft.

The machine used was practically identical with the Leoning land monoplane two-seater and was fitted with a 300-h.p. Hispano-Suiza engine.

AIRCRAFT IN PARLIAMENT

HOUSE OF COMMONS.

Nov. 24th.—The following oral answer was given:—

DOUGLAS-PENNANT INQUIRY.

Sir J. BUTCHER asked the Prime Minister whether he can state the approximate total cost to all parties concerned of the recent Committee of Inquiry of the House of Lords into the case of Miss Violet Douglas-Pennant; what portion of that cost will fall on the public purse; and whether a method can be devised whereby persons who are, in the course of such an Inquiry, made the subject of charges which turn out to be totally unfounded may be protected against the cost of defending themselves against such charges?

Mr. BONAR LAW: It is not possible at present to state the approximate total cost of the recent Inquiry, or what portion of it will fall on the public purse. As regards the last part of the question, my hon. and learned Friend's suggestion is receiving consideration.

Sir J. BUTCHER: Will my right hon. Friend consider the propriety of making provision that evidence given before these Committees of Inquiry shall not be regarded as privileged?

Mr. BONAR LAW: Nobody knows better than my hon. and learned Friend that that would be a very big departure to make

The following written answer was given:—

AIR MINISTRY (STORES).

Mr. HOHLER asked the Under-Secretary of State to the Air Ministry how many yards of cloth (various), how many pairs of boots, how much hosiery, flannel, leather, hardware, crockery, and glass, how many brushes and brooms, and what amounts of timber are held by this Department; and will he give particulars of the amounts disposed of and to whom from April 1st last to October 1st last?

Mr. CHURCHILL: The stocks of cloths, hosiery, leather, and timber held by the Air Ministry are given below. The preparation of a list of the stocks of hardware, crockery, glass, brushes and brooms would involve an amount of clerical labour which would not be justified in the present reduced state of staff.

Cloth in yards: Gabardine, blue, 147; overcoating, khaki, 31,401; serge, blue, 136,963; tartan, blue, 67,930; serge, khaki, Canadian, 13,266; serge, drab mixture, 102; whipcord, blue, 3,220; whipcord, khaki, 20,658.

Boots, ankle, pairs, 15,535.

Hosiery in pairs: Socks, worsted, 445,947; drawers, woollen, 109,846; vests, woollen, 33,341; Shirts, flannel, 232,390; flannel, nil.

Leather in pounds: Soles, bend, 1,014; bellies, struck, 24; shoulders, 9; tongues, 5½. Lifts, assorted and in pairs, 4,217; soles, half, 32,404; tip, fillings, 17,568.

Timber in standards: Aeronautical timber, 338; other timber, 157.

None of the above classes of materials were declared surplus between April 1st and October 1st.

The following quantities of cloth were declared surplus on October 22nd and 25th, and are being handed to the Disposal Board:—Cloth in yards: Gabardine, blue, 147; overcoating, khaki, 31,401; serge, blue, 100,000; tartan, blue; 50,000; serge, khaki, 13,266; serge, drab mixture, 102; whipcord, blue, 1,165; whipcord, khaki, 20,658; cord, khaki, 20,658.

* * *

Nov. 25th.—The following oral answer was given:—

CIVIL AVIATION.

Major GLYN asked the Secretary of State for War whether the Government contemplate assisting the industry engaged in civil aviation by any of the suggested methods contained in Section III of the Air Ministry's Synopsis of Progress of Work in the Department of Civil Aviation (Cmd. 418).

Captain GUEST (Joint Parliamentary Secretary to the Treasury): Indirect assistance by the provision of key aerodrome and shed accommodation, the collation and issue of information and the provision of communication is being afforded to civil aviation. The question whether any further action is necessary is under consideration.

* * *

Nov. 26th.—The following oral answer was given:—

ROYAL AIR FORCE (HAIR FOR MATTRESSES).

Mr. PARKER, replying for the Secretary of State for War to Mr. Macquisten, said that a request was made to the Disposal Board by the Air Ministry to reserve 90 tons of hair, and that the Ministry has been informed that the hair so reserved is at Neasden. To a considerable extent airmen have hitherto been sleeping on straw palliasses and on bed boards, and the hair referred to above has mainly been obtained for the manufacture of hair mattresses to remedy this state of affairs at the stations to be permanently retained by the Royal Air Force. It is not the intention of the Air Ministry to store hair in excess of immediate requirements.

Mr. MAQUISTEN: Is the hon. Gentleman not aware that there are thousands and thousands of beds, belonging to the Army, stored up and down the country? I could give him instances. For what purpose are they making new ones when these stores are enough?

Mr. PARKER: I do not know anything further about the matter.

* * *

The following written answer was given:—

ROYAL AIR FORCE.—AIRSHIP SERVICE.

Lieut.-Comdr. KENWORTHY asked the Under-Secretary of State for the Air Ministry how many large rigid airships are now in commission; how many large rigid airships are under construction; how many large airship sheds are in use; and how many have full staffs and crews in attendance for handling airships; and what is the estimated total cost next year of the Airship Service, rigid and non-rigid, for the Royal Navy?

Mr. CHURCHILL: The reply to the hon. and gallant Gentleman's first question is that there is one large rigid airship (R34) in commission for the Navy, and that two (R32 and R33) are being maintained temporarily, pending a decision as to the most advantageous method of disposing of them.

The reply to the second question is that the construction of R38 is proceeding under an arrangement for her sale, when completed, to the Government of the United States of America. A certain amount of work is being done on three other ships, pending the issue of negotiations for their use for commercial purposes.

The reply to the third question is that the large airship sheds in use are five in number, at Pulham, East Fortune, and Howden. It is intended to retain permanently for service purposes the airship station at Howden with two large sheds. The reply to the fourth question is that none of the air ship stations has full staffs and crews. The reply to the fifth question is that the Estimates for the Airship Service are included in the general Estimates for the Royal Air Force, and that these latter being still under consideration no figure can be given. Even when the Royal Air Force Estimates are passed, it is not intended to show separate Estimates for the airship side of the Air Force, because the personnel of the different branches will, to some extent, be interchangeable within the Service.

* * *

Nov. 27th.—The following oral answer was given:—

ROYAL AIR FORCE.—GOVERNMENT POLICY.

Maj.-Gen. SEELY (by private notice) asked the Prime Minister whether the Air Policy of the Government in respect to the Air Ministry is the same as it was on Nov. 14th, 1917, when the present Lord Privy Seal stated that the whole of the Air Service must be independent of either the Admiralty or the Army Council; why the Secretary of State for War is now President, both of the Army

Council and the Air Council, and whether the Air Council is now independent of or dependent on the President of the Army Council?

The PRIME MINISTER: I regret that my right hon. Friend did not see his way to put notice of this question down on the Paper. Nothing has arisen in the course of the last two days which was not in existence before, and, therefore, notice might have been given. I will, however, do my best to answer, as far as I can, in the short time at my disposal.

It has already been stated that there is no change whatever in the Air Policy of the Government, which remains the same as it was when my right hon. Friend accepted the position from which, to my regret, he has recently retired.

Maj.-Gen. SEELY: May I ask the Prime Minister how he can say that there is no change in the policy of the Government as announced by the Lord Privy Seal when he said that the Air Ministry must be independent of the Admiralty and the Army Council; further, will he give an opportunity to this House to express its opinion on a change of policy from a decision which was so strongly endorsed by his own colleagues?

The PRIME MINISTER: The Army Council has no control whatever over the Air Force—none. It is perfectly independent of the Army Council.

Lord H. CECIL: Not of the President of the Army Council.

The PRIME MINISTER: That is the Secretary of State for War, who holds both positions. That has been done many times in the history of this country, and it is thought desirable in this case. With regard to the latter part of my right hon. Friend's question, I have already said, in answer to my noble Friend, that if there is a general desire on the part of the House for a discussion of the subject, the Government will find time—(Hon. Members: "No, no!")—but I would point out that the pressure of business is very great, and we do not wish to allocate time unless there is a general desire on the part of hon. Members.

Lord H. CECIL: Will the Prime Minister consider whether a few hours or half a day would not be quite sufficient for this purpose; has not recent experience shown that there is often half a day at the disposal of the Government, if they cannot promise a whole day, and could we not have a friendly arrangement that half a day should be assigned, without any inconvenience to the Government, to give the Government an opportunity of explaining to the House the rather metaphysical obscurities which have arisen?

* * *

Dec. 1st.—The following written answer was given:—

THE R.A.F. IN RUSSIA.

Capt. GUEST, replying to Lt.-Col. Malone, said that 277 aeroplanes had been sent to the forces serving under General Denikin. There were at present 101 Royal Air Force officers and 300 airmen serving with these armies. These troops volunteered for this service, and were to be maintained up to March 31st, 1920. The actual date of their withdrawal had not yet been settled.

ON AIR POLICY.

The following letter written by Major-General J. B. Seely, C.B., D.S.O, appeared in the "Times" newspaper on November 26th—

Sir.—In your leading article of November 13th, headed "The Turning Point in Air Policy," you pointed out that a fundamental issue had been raised. I venture to ask space in your columns in order to define that issue

In his letter to you last week Lord Montagu reminded your readers of the manifold drawbacks which were found in the old system of a divided Air Service, with divided control. Impelled by these reasons, the Government, in November, 1917, introduced the Air Force Bill

The scheme was commended to Parliament and to the country by Ministers who then formed, and still form, part of Mr. Lloyd George's Government, and it is well to recall the reasons then given by those responsible Ministers.

Major Baird introduced the Bill in the House of Commons on November 12th, 1917, and explained, in detail, the objects of the Bill, namely, to create a separate Secretary of State for the Air, a separate Air Council, and a separate Air Service. With regard to the first point he said:—

"The head of the fighting Service will have to discharge various duties now discharged by the Secretary for War, and which cannot be performed under our Constitution except by a Secretary of State. I will give one example. I believe the channel of communication between the Sovereign and an officer who feels himself aggrieved or the officer who has the right of reply is only through a Secretary of State It would not be satisfactory if an officer of the Air Service felt aggrieved that he should have to apply to his Sovereign through the Secretary of State of another Department. Another reason is to give to the Air Force the same status as we give to the Army and Navy to recognise that the Air is an element in which it is as necessary to make provision for national defence and offence as it is for us to do on sea and land. These are the main reasons why it was thought wise to have a Secretary of State instead of a Minister of lesser rank."

The present Lord Chancellor, then Attorney-General, in supporting the Bill, said:—

"It is the spirit and object of this Bill that the Air Service shall be recognised as an entirely distinguishable Service, that those who are responsible for it shall form a new and important Department answerable to Parliament and responsible for the Service for which it so answers to Parliament, and with complete control unfettered by any other Service over all those who belong to it."

Mr. Bonar Law two days later stated definitely the Government's determination that

"the whole of the Air Services must be treated as one and transferred to the new Department and become a new Service independent of either the Admiralty or the Army Council."

In the House of Lords Lord Crawford, the late Privy Seal, introduced the Bill on November 21st, and emphasised the independence of an Air Service in the following words:—

"Your lordships should remember that it is impossible for our Army to conduct a campaign without the assistance of the Navy, and I do not suppose there has ever been a naval war in which we have been engaged without the Army giving its assistance; but it is quite conceivable that without the help either of the Army or of the Navy a whole campaign could be conducted by aircraft. For these reasons the Government has presented this Bill. It creates an Air Council, an Air Staff, and an Air Force. It makes a distinct Service, which, although closely and indeed intimately connected with the Navy and with the Army, will have its own ideals and its own personality. It will be governed and controlled in a manner specially devised to develop its great and incalculable resources."

And, finally, on the same day, Lord Curzon, then, as now, Leader of the Government in the House of Lords, stated the Government's intentions quite definitely, and, as always, with admirable precision. These were his words:—

"The noble and learned viscount, Lord Haldane, made another observation which was perfectly true. I will give in substance what he said. He told us that this is not only a war measure, but a post-war measure too. Nothing could be more true than that remark. Astonished as we all have been by the scale and magnitude of the development of air service in the war, it ought by no means to be supposed that that development will cease with the war. On the contrary, every one of us knows that there are futures which lie before the Air Service—into which I need not enter to-night—which will render it not only for years to come, but permanently, a necessary part of what I may call our Imperial organisation. This Air Ministry is not wanted for France, Flanders, Salonika, or the East only, but it is required as a part of the material and mechanical resources of the country."

The Bill was unanimously approved by both Houses and duly received the Royal Assent.

Following on this great reform, our air power increased to an astonishing degree on the military side. On the civil side, we obtained the lead over all other countries, a fact which they have been the first to acknowledge. As will be seen from the report of the American Aviation Mission, which was issued as a Parliamentary Paper last month, the Mission definitely recommends the concentration of military, naval, and civil air activities in the United States within the direction of a single Government agency created for the purpose, co-equal in importance with the departments of War, Navy, and Commerce. It is not uninteresting to observe from the same Parliamentary Paper that the United States Secretary for War does not accept the report on behalf of his Department.

In the face of all this, the Prime Minisetr endorses a plan by which the air is placed under the Secretary of State for War. In addition to the fact, to which reference will be made later, that this proceeding is contrary to the declarations of Ministers and to the decision of Parliament, it is in itself a fantastic arrangement. No man can possibly be a responsible Minister at the head of two wholly independent Services, any more than a man can be a captain of two ships or colonel of two battalions. One must be subordinate to the other, and the work of one or both must suffer. In this case, it is the air which suffers now and must suffer still more in the future from the inevitable lack of attention by its responsible head, who already has to fulfil one of the most exacting duties under the Crown. In view of these facts, the Prime Minister's statement, in reply to a question by Lord Hugh Cecil last Thursday, that "there has been no change whatever in the policy of the Government in regard to the Air Force" is inexplicable to the plain man, for it is clearly at variance with the facts. Indeed, to make such a statement is to trifle with the House of Commons and the country. The present system cannot possibly continue, and the Government must frankly adopt one of three alternatives:—

1. To abolish the Air Ministry and again divide up the Air Force between the Navy and the Army, and hand over the immense possibilities of civil aviation to some existing Government Department;
2. To create a Ministry of Defence to which the Ministers of Land, Sea, and Air should be responsible;
3. To free the air entirely from control by the head of another Department.

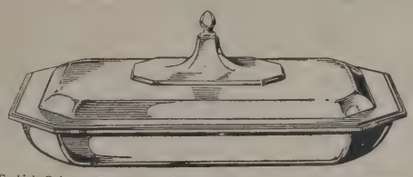
The first plan would be resisted to the utmost by all those who care for our future position in the air. The second would have the immense advantage of securing a proper co-ordination of our war efforts, but must take long to achieve. The third is to abide by the decision of Parliament and the declarations of Ministers. It is proper now to inquire and to press for an answer to the question whether those Ministers still adhere to their emphatic declarations of two years ago—that there should be a separate Secretary of State, presiding over a separate Air Council, directing a separate Air Service; that the need for a separate Secretary of State was inherent in the scheme, as pointed out by Major Baird; that the new arm of the air was established "for all time" in the words of the present Lord Chancellor, and in the words of the present Foreign Secretary, Lord Curzon; that the creation of the new organisation was not only a war measure, but a post-war measure, too, and "a permanent and necessary part of our Imperial organisation."

If the Prime Minister and his colleagues do not abide by the statements then made, Parliament and the country have a right to be informed what reasons they can give for the reversal of a policy which they then announced as being vital to the safety and well-being of our country and our Empire.

I am, Sir, your obedient servant,

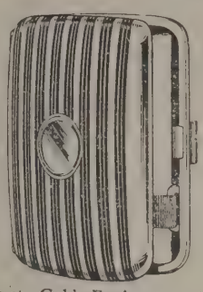
JOHN BERNARD SEELY.

AN INTERESTING CHANGE.



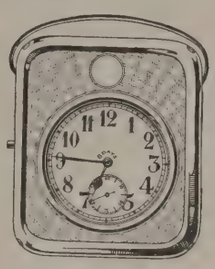
It is interesting to note what one time prominent people in the Aircraft Industry are doing now, and one is glad to hear that Mr. and Mrs. Latimer-Voight—formerly managing directors of the Integral Propeller Company, Ltd., and the Pegasus Aircraft Co., Ltd.—are doing well. They have established the City of London Service Co., Ltd., with offices at 43, Dover Street, W.1., where they are engaged in a large way of business.

They have also opened offices in New York, Brussels, Lisbon, Cologne, Athens, and Constantinople, and are actively engaged in importing and exporting articles, principally food stuffs. Later on, Mr. and Mrs. Latimer-Voight intend establishing branches in all important continental cities. Mr. and Mrs. Voight have as co-directors several men well known in commercial circles, and their prospects of building up a large business are exceedingly bright.



The City of London Service Company would be pleased to hear from firms in the engineering trade who wish to be represented in foreign parts. One of the directors is established in New York, and another is now proceeding to the Balkans. Mr. Voight will shortly be making an extended tour on the Continent.

THE PROCEEDS OF A THÉ DANSANT.



Lady (Milsom) Rees has handed over to the authorities of the Charing Cross Hospital a cheque for £300, being the proceeds of the Thé Dansant given at the London Flying Club, Hendon, on Saturday, November 22nd.

Solid Silver Octagon-shaped Entree Dish with cover. Length 9½ inches, **£20.**

9 ct. Gold Engine-turned Concave Single Row Cigarette Case, **£11 5s.**

A TRIP TO BANANA SIDING.

News from South Africa travels slowly. A copy of the "S.A. Pictorial," dated June 28th, has been received only recently. In that issue of the weekly paper, there is an account of a flight by Lieut. A. H. Gearing (late R.A.F.), which is written as a result of an interview with him by Mr. H. Goldstone.

Lieut. Gearing flew with a passenger in a B.E.2E. biplane from Johannesburg to Banana Siding, 115 miles by rail from Pietersburg. They left Johannesburg on May 20th at 9.30 a.m., and climbing to 3,000 ft., arrived over the Square at Pretoria at 10 a.m. Two pictures of the town from the air were taken from about 2,000 ft.

Just Off.—The start of the Flight.

The remaining 100 odd miles to Pietersburg was flown along the edge of huge slow moving clouds. They arrived over the landing ground near Pietersburg at 12 noon at an altitude of 6,000 ft. After spiralling down to 2,000 ft., a photograph of the landing-place was taken. There is a big lined cross showing the smooth ground on which to land. A landing was made at 12.10 p.m. amidst a great crowd, the whole town having turned out to witness their arrival.

On the following day an exhibition flight was given. People came from miles round to see the first aeroplane which had ever visited those parts.

They left for Banana Siding on the morning of May 22nd. Helped by a strong wind the cross-country journey was made in 40 minutes. Mr. Stamford, the Native Commissioner, met them on arrival. Before they touched the ground not a native was to be seen, but as soon as the machine came to a standstill, the place became alive with Moshlaba's people in all their war-paint.

The natives, who had all been amongst the trees and bushes, headed by their chief, then formed a huge square around the machine.

Lieut. Gearing was treated to the royal salute, "Bayete!" an honour seldom accorded to a white man. For the rest of the day they were fêted and feasted.

The following day was spent in watching the different schools of dancing rehearsing for the big dance. They saw the Circumcision Schools, which had never been visited before by white people.

On May 23rd an exhibition of flying was given. The Chief was invited to go up, but firmly refused.

Special trains from Pretoria and Pietersburg arrived on the following morning (Empire Day). Then the real dancing began. After days and days of rehearsing the different schools formed up in a double circle some thousands of yards in diameter. Day and night the tom-toms boomed reverberatingly. A most awe-inspiring sight. The dancers flung themselves into ecstasies of movement for nearly 48 hours. When they became exhausted others replaced them. Their dress was a waving mass of headdress, armlets, rings and bands of all descriptions. The arms and lower limbs only were visible. They had worn those costumes for three months previous to the day of the dance.

Before leaving Banana Siding Lieut. Gearing gave an exhibition of bomb-dropping. He demolished a small kopje in three shots. "King of the Air" was his native name after that. The Chief invited him to a hunt and provided a small army of beaters and attendants.

Lieut. Gearing and his pet squirrel which accompanied him on several flights, and has recently died.

After exchanging mutual good wishes, a return was made to Pietersburg on May 26th, where a stay was made and exhibition flights given during the Agricultural Show on June 4th and 5th.

The return trip to Johannesburg was made in a non-stop flight of 2 hr. 50 min. Not a single hitch marred the flying during the whole of the trip. Some 1,000 were flown over country never before traversed by air. No difficulty would have been found if a landing had had to be made in any part of the country covered. South Africa is a wonderful country for aviation.

THE 1920 MONACO MEETING.

The following further details of the seaplane competition which is to be held at Monaco next spring are now available.—

The contest is open to machines of all the Allied nationalities, but each machine is to be wholly the product of one nationality.

The pilot must be a citizen of an allied nation and must hold a pilot's certificate of a body affiliated to the Fédèration Aeronatique Internationale. He need not be of the same nationality as that of the machine he is to fly.

Machines must make the flights hereafter laid down, carrying a useful load of 400 kgms., in addition to crew, fuel, etc. Any machine carrying a complete wireless outfit independent of the main power plant will be allowed an abatement of 30 kgs. in the load carried—i.e., need carry only 370 kgms.

A start may be made on any day and at any time in the day which may be chosen by the competitor on or after 6 a.m., April 18th; provided that the whole test is completed by 6 p.m on May 2nd.

The first stage shall be Monaco-Corsica (alighting at Ajaccio or Bastia, at the competitor's choice)—Corsica-Bizerta. Distance, 750 kms.

The second stage shall be from Bizerta, round the Bizerta lighthouse, round the lighthouse at Sousse, and back to Bizerta. Distance, 500 kms.

The third stage is, Bizerta-Monaco direct. Distance, 750 kms.

The controls are open on each day from 6 a.m. to 6 p.m., and every complete stage must be made in one day between those hours.

The actual time taken on the last stage only will be taken —this stage being a speed test, and the speed on this stage will be used to discriminate between machines scoring equally on the other two stages for reliability and economy.

Each machine before starting on the trials is required to climb to 2,000 metres in not more than 45 minutes with its full load on board.

The prizes will be :—

1st prize	.....	100,000 francs
2nd prize	.....	30,000 francs
3rd prize	.....	12,000 francs
4th prize	.....	8,000 francs

During the course of the meeting there will be two other contests for seaplanes, each for 5,000 francs prize.

The first is an altitude test, and the second a speed contest. For the latter contest all entrants must qualify by climbing to 3,000 metres in less than one hour.

SPORTING FLYING AND THE ROYAL AERO CLUB.

The following letter has been received from a member of the Royal Aero Club who has long been intimately concerned with aviation. As a business man of proved ability his views are worthy of attention, not only by the Committee of the Royal Aero Club, but also by those of higher intelligence :—

Sir,—Apropos your leader in a recent issue, the contents of which reflect much thought for the powers that be at our clubs :—Perhaps they fed on those thoughts as well as Mr. Frisbee's good things the other day when "sitting" in one of the most comfortable rooms for lunch. I bowled in there myself, not having seen the notice on the door that the Committee was "sitting," because it was natural since they were also lunching, until my "faux pas" was, just in time, pointed out to me.

However, all that is by the way—my point is that if the R.Ae.C. are going to conduct the sporting shows of aviation, which I think they should do, now is the time for them seriously to consider the contests for next year. It would do Aviation a power of good if we had a series of really good sporting and international contests. In fact all contests should be international, because we might learn things from our friends abroad, and if constructors and designers can consider details after, say, Christmas, they can build machines and make plans in good time.

Claude Grahame-White, I understand, was in favour of the London-Paris, or London-Manchester race being not for speed but for general commercial reliability, and with this view I entirely agree, but, on the other hand, if we can have a series of races or competitions next year we can combine both speed and reliability.

I venture to suggest a programme, details as to prizes, distances, etc., to be worked out, of course :—

SPRING.—Two speed races, one for land machines and one for seaplanes, the power to be carried being specified. Two reliability trials over long distances in or round the coast of England

SUMMER.—Two speed races, one over land and one over sea for long distances.

Two reliability trials over land and sea for all countries, and the course embracing France.

AUTUMN.—One each speed race and reliability trial in or around England.

A series of good, sound competitions, such as I have suggested should find a great deal of support if efficiently worked by *our* Club. As you say, there are several people who *can* organise these shows, and the Royal Aero Club, being an impartial body, are the people to do it.

I would like to make one or two suggestions as to the programme set out :—

(1) Although the S.B.A.C. should certainly be consulted, *i.e.*, they should appoint one or two people to discuss details, the details and organisation should be settled by the Club Committee, or some other impartial body.

(2) The members of the Committee deciding the details should be specially selected for the work, and should not necessarily be Committee men appointed by the members of the club to run the club as a club.

(3) Speed races should be for machines carrying a fixed horse-power in one or more engines.

(4) Reliability trials should mean that machines must carry passengers and goods, or passengers only, or goods only, of a specified load. Also landings and stops should form a condition of some contests, and marks should be given for a separate trophy or prize for commercial utility as to arrangements for passengers and cargo.

(5) The amount of monetary prizes should not be the chief aim of competitors, but the contests should be made so attractive that firms winning them will get kudos and publicity helpful to them commercially.

The whole matter is one for long and careful consideration, but as I was hopeful at the beginning of this year that contests would be held, I am still convinced that the holding of contests will do more for Commercial Aviation than anything else.—OBSERVER.

BANKRUPTCY.

George Harold Humphrey, director of public companies, 23, Hangar Lane, Ealing, and late of 4, Ellison Place, Newcastle-on-Tyne.

The first meeting of creditors under a receiving order made against this debtor on his own petition was held on November 27th at the London Bankruptcy Court.

Mr. F. T. Garton, Official Receiver, who presided, said that a statement of the debtor's affairs had been lodged showing gross liabilities £8,500, unsecured £17,770, and contingent debts £58,500, which were not expected to rank for dividend. The assets were valued at £10,065. The debtor had stated that in August, 1914, he and another person formed the Rural Developments Co., Ltd., of which he was appointed managing director. The company was successful until November, 1915, but two years later went into voluntary liquidation. In June, 1914, a company in which he had been interested having given up certain works near Fawkham, Kent, he registered the Fairby Construction Co., Ltd., to work in conjunction with the Rural Developments Co. in building cottages on the Fairby Farm Estate. He was appointed managing director and acted in that capacity until 1917 when he became an ordinary director. In January, 1917, at the suggestion of a representative of Armstrong Whitworth and Co. who promised him contracts, he took the Victoria Works, Newcastle-on-Tyne, and formed John Dawson and Co. (Newcastle-on-Tyne), Ltd., to take over his interest and manufacture aircraft wings. The nominal capital of the company was £10,000. The debtor became managing director and took up the issued capital of £2,100, but later he transferred some of his shares to other persons who became directors. The company was financed by payments made on account of contracts with Armstrong Whitworth and Co. until December, 1917, but afterwards the company made contracts direct with the Government, who paid week by week. The company was very successful until the Armistice, when notice was given terminating the contracts, and differences arose between the company and the Government as to the amount due to the company. Pending the settlement of these differences the debtor endeavoured to sell his interest in another company (Allan Jones and Co. (1918), Ltd.); to George Clare and Co., Ltd., and out of the money so raised he paid the accounts and financed John Dawson and Co. On June 4th last the Government settled the claim for £30,000, which was less than the amount expected. The debtor then endeavoured to amalgamate the company with Allan Jones and Co. (1918), Ltd., a company of which he was governing director, which carried out contracts for aircraft parts. In anticipation he guaranteed debts of John Dawson and Co. to the amount of £15,000. Eventually the amalgamation fell through and John Dawson and Co. went into liquidation. The debtor was pressed on his guarantees and decided to file his petition. He attributed his insolvency to the failure of the company, of which he claimed to be a creditor for £10,000.

The creditors appointed Mr. Oliver Sunderland, accountant, as trustee of the debtor's estate. A committee of inspection was also nominated.

Steel & Service

The name of Edgar Allen's has always been associated with steel of the finest quality, and it is also linked up with the idea of service. The undermentioned list of handbooks and catalogues indicates one way in which this idea is carried into execution. Write for

BURBERRY CARAPACE AIR-SUIT

Worn by Sir John Alcock on his Trans-Atlantic Flight

The Carapace Air-Suit is made up of three layers, each of a different material, scientifically combined to ensure the greatest possible resistance to wet or cold. The outside is of Burberry Gabardine so densely woven and proofed that it will withstand intense pressure from wind or rain.

The second layer is in the form of a luxurious lining of Fleece, that supplies a wealth of warmth, yet is extremely light.

The innermost lining is of Glissade, a smooth-surfaced material, which enables the airman to slip into or out of the suit with celerity.

A double plastron of Burberry Gabardine across the chest and shoulders, a Burberry Puttee Collar, an adjustable waist-belt, and devices for tightening the sleeves and legs add comfort and stability to an outfit which ensures complete security, yet is much less weighty and cumbersome than leather kit.

BURBERRY MATERIALS ventilate naturally and thus avoid the condensed moisture which cold causes to form on the inner surface of air-tight fabrics, rendering them useless for flying.

Illustrated Catalogue & Patterns Post Free

Every Burberry Garment bears a Burberry Label.

PERSONAL NOTICES.

NAVAL.

ENGAGEMENT.

SMYTH-PIGOTT—FEILDING.—The wedding of Lieut.-Colonel Ruscombe Smyth-Pigott, D.S.O., R.A.F. (late R.N.A.S.), and Lady Clare Feilding will take place at Newnham Paddox, Lutterworth, on Tuesday, Dec. 30th, at 10.30.

MILITARY.

DEATHS.

KNIGHT.—Frederick Ayshford Knight—or Teddy, as he was usually known—who was recently killed while flying at Cambridge, was the eldest son of Major Eric Knight, M.P., and Mrs. Knight, of Wolverley House, Kidderminster.

A correspondent writes :—

He was educated at St. David's, Reigate, and Eton. He left Eton at the age of seventeen to join the British Army, but being too young he went across to France and succeeded in being taken on as an ambulance driver to the French Army. He went through most of the trying times at Verdun, and eventually came home to England and tried to join the Royal Air Force. For some obscure reason he was turned down as unfit, and eventually was appointed to a cadet battalion for the Guards.

On demobilisation he went up to Trinity College, Cambridge, where at the time of his death he was in his second year.

Teddy Knight was one of that all-too-rare type, the lover of flying for flying's sake. Recently at his own expense he started to learn to fly at a well-known English flying school and had the makings of a really fine pilot. His enthusiasm was unlimited, and he always took a joy-ride when he could get one, and it was during one of these latter that he met his death. So far as one can gather, it was the old story of a failing engine on leaving the ground.

Had he lived, Teddy Knight would undoubtedly have made a great name for himself in the flying world.

Always cheery and ready to help one out of a difficulty, good at games and his work and a brilliant pianist, the world is the poorer for his loss and the writer loses his best and most valued friend.—G. D.

SPENCE.—Lieutenant James Hamilton Spence, R.G.A. and R.A.F., who was previously reported missing on July 16th, 1918, is now officially presumed to have been killed. He was the only son of Mr. and Mrs. Hamilton Spence, Stoke Abbott, Beaminster, Dorset. He was 20 years of age.

ENGAGEMENT.

BODDY—EWEN.—The engagement is announced between Lieut. J. A. V. Boddy, D.L.I. and R.A.F., son of the Rev. and Mrs. A. A. Boddy, All Saints Vicarage, Sunderland, and Marjorie D'Arcy, younger daughter of Mr. and Mrs. A. J. Ewen, of Leicester.

MARRIAGES.

LINDOP—LEVASSEUR.—On Nov. 29th, at the Westminster Cathedral, Captain A. H. E. Lindop, M.C. and Bar, 37th Dogras, Indian Army, attd. R.A.F., elder son of Lt.-Colonel A. H. Lindop, late Royal Dublin Fusiliers, was married to Miss Ivy Gertrude Levasseur, elder daughter of Mr. E. Levasseur, of Frinton, Pinner.

MITCHELL—HINGSTON.—On Oct. 31st, at Brompton Parish Church, S.W., Wing. Comdr. W. G. S. Mitchell, D.S.O., M.C., A.F.C., R.A.F., was married to Essy, widow of the late Capt. F. L. Hingston, Duke of Cornwall's Light Infantry, of 118, Brompton Road, S.W., by Prebendary A. W. Gough.

STUART-WORTLEY—EDWARDES.—On Nov. 12th, at St. James's Church, Spanish Place, Major Nicholas Rothesay Stuart-Wortley, M.C., R.A.F., only son of Major-General the Hon. E. and Mrs. Stuart-Wortley, was married to Marie Louise, widow of the late Captain the Hon. Cecil Edwardes.

WINKWORTH—DONALD.—The marriage of Mr. Henry Winkworth, late Queen's Bay's and R.A.F., and Miss Margot Donald, was celebrated on Nov. 19th, at St. James's Church, Spanish Place, W. Father Thurston, S.J., officiated.

AIR FORCE.

MARRIAGE.

HAWARD—DUNCAN.—On Oct. 23rd, at Brechin Cathedral, Forfarshire, Reginald S. Haward, late R.A.F., younger son of Mr. and Mrs. Percy J. Haward, of Hendon, was married to Margaret Edith Balfour, daughter of Mr. and Mrs. James Duncan, of Balfour, Brechin, N.B.

BIRTHS

FORBES.—On Nov. 23rd, at 8, Kensington Gate, W.8, Marjorie, the wife of Wing Commander J. L. Forbes, O.B.E., R.A.F., of a son.

WARBURTON.—On Oct. 8th, at Simla, India, the wife of Capt. Peter Warburton, M.B.E., R.A.F., of a son.

WILCOCK.—On Nov. 8th, to the wife of Capt. C. A. Wilcock, A.F.C., R.A.F.—a son.

THE ROYAL AERO CLUB NOTICES.

NEW COMPANIES.

The following new companies have been registered :—

WEYBRIDGE MOTOR ENGINEERING CO., LTD.—Private company. Registered Nov. 21st. Capital, £200,000 in £1 shares. Objects : To take over all or part of the business, property, contracts and liabilities of Gordon Watney and Co., Ltd. (incorporated in 1913), and to carry on the business of buyers, sellers, importers, exporters, manufacturers and repairers of motors, engines, machinery, motor vehicles and motor cycles, motor, electrical and mechanical engineers, fitters, etc., and to enter into an agreement with G. E. Sandell and Gordon Watney and Co., Ltd. The subscribers (each with one share) are :—A. H. Hewett, 40, Cambridge Road, Bromley, Kent (secretary to a limited company), A. J. L. Greig, 53, Shepherd's Lane, Dartford, Kent (commercial clerk), J. S. Stack, 145, St. John's Hill, Clapham, S.W. (commercial clerk). The first directors are to be appointed by the subscribers. Solicitors : Piesse and Sons, 15, Old Jewry Chambers, E.C.

DOVER AIRCRAFT VENTURES, LTD.—Private company. Registered Nov. 20th. Capital, £1,000 in 750 ordinary shares of £1 each and 5,000 deferred shares of 1s. each. To establish, maintain and work lines and services of aerial conveyance, and to carry on the business of carriers of passengers, goods and mails, etc. The subscribers (each with one share) are :—J. M. E. Webb, 1, Heathfield Av., Dover (clerk), R. G. S. Williams, 22, Leighton Road, Dover (clerk). Table "A" mainly applies. Solicitor : E. E. Chitty, 19, Castle Street, Dover.

MODERN MOTION, LTD.—Private company. Registered Nov. 21st. Capital, £1,000 in 800 preference shares of £1 each and 800 ordinary shares of 5s. each. To carry on the business of dealers in motors, aircraft and their accessories, general merchants, etc. The subscribers (each with one share) are :—G. H. Bettinson, 93, Old Christchurch Road, Bournemouth (aeronautical engineer), Capt. H. Kirby, Linden Hall Hydro, Bournemouth. First directors : G. H. Bettinson and Capt. H. Kirby. Solicitor : A. Glynne Jones, Cromwell House, Surrey Street, W.C. Registered office : 93, Old Christchurch Road, Bournemouth.

THE AEROPLANE

VOL. XVII. No. 24.

The Editorial and Advertising Offices of "The Aeroplane" are at 175, Piccadilly, London, W.1.
Telegraphic Address: "Aileron, London." Telephone: Gerrard, 5407.

Accounts, and all correspondence relating thereto, should be sent to the Registered Offices of The Aeroplane and General Publishing Co., Ltd., Union Bank Chambers, 61, Carey Street, London, W.C.2.

Subscription Rates, post free: Home, 3 months, 7s. 6d.; 6 months, 15s.; 12 months 30s. Foreign, 3 months, 8s. 9d.; 6 months, 17s. 6d.; 12 months, 35s. Canada, 1 Year, $8. U.S.A., 1 Year, $8 50c.

ON SIX MONTHS OF CIVIL AVIATION—III.

Ground Work.

Naturally, after the subject of aerodromes one comes to the subject of communication on the ground, as follows :—

(*f*) Communications.—One of the lessons learnt during the war was the supreme necessity for rapid ground communication. It was early realised that for civil aviation ground communications, wireless, etc., must be speeded up, and greater facilities afforded, in order that the arrival and departure of machines should be promptly reported. For this purpose the ordinary public telegraph and telephone service is often insufficient. Owing to the time occupied in conveying the message to and from the nearest public office, and the pressure of traffic at the present time on the long-distance telephone lines, especially abroad, the aeroplane may arrive as soon as, or even before, the receipt of the message announcing its departure. The scope of the branch at the Air Ministry in charge of this particular work covers the requirements of both civil and Service sides. For the present purpose, however, it is proposed, as far as is possible, to refer only to its functions in regard to civil aviation.

The duties of the Communications Branch may be regarded as falling under two broad heads, which, for the sake of convenience, may be termed *signals* and *navigation*.

Signals.—Under the first heading an important part of the work carried out has been in connection with wireless telegraphy and telephony, and the development of aerial navigation by means of directional wireless. Wireless stations have been erected at Hounslow and Lympne, and wireless liaison has been established with the French for the purpose of the London-Paris air route. By this means machine reports and weather reports have been successfully exchanged, the number of such messages on this route averaging 30 a day. From the experience thus gained it has been possible to inaugurate similar arrangements, which are now nearly complete, for the Belgian and Dutch routes.

Meteorological reports will in future be transmitted almost entirely by wireless telegraphy. At present weather reports are received by this means from British and Continental Stations for the information of the Meteorological Service, and weather forecasts distributed three times a day from the Air Ministry.

A complete scheme of wireless organisations for the entire Meteorological Service has now been prepared. In addition to Communications, the branch is responsible for the supervision of the training and examination of the wireless personnel.

Regulations are also being drawn up in conjunction with the Post Office for a revised wireless operator's certificate in order to provide for qualified "Air" wireless operators. Similarly, the conditions for obtaining licences to work wireless stations have been revised to include the use of wireless in commercial aircraft and from ground to air.

It may be noted that the Communications Branch has, since the armistice, been instrumental in arranging for the release for public use of—

Switchboards	63
Trunk Lines	96
Exchange Lines	324
Telephones	2,040

Navigation.—On the navigational side, the whole of the London to Paris air route has been surveyed, an experimental strip map prepared for aerial purposes and "flying directions" compiled containing information as to aerodromes, landing grounds, wireless and meteorological data. This is the first of a comprehensive library of air maps and flying directions which it is hoped will be produced for all the main routes. Charts and maps are also prepared and issued for all intended flights on new routes.

In co-operation with Trinity House, proposals have been considered for the installation of an aerial lighthouse system on the London to Paris route, and an experimental lighthouse has been erected at Hounslow. Preparations have also been made for the lighting of the aerodromes on this route, in the event of firms setting up services which necessitate night flying.

None will quarrel with the pious resolution to expedite ground communications as an aid to aerial navigation. One is not aware how far the Air Ministry has been able to retain the services of those very able wireless officers who served in the R.A.F. One fears, judging by the wholesale demobilisation of the cleverest technical and research officers in other branches of the Service, that there can be but few left. But in any case the R.A.F. possesses an equipment of wireless apparatus, both telegraph and telephone, which is unsurpassed by any other country. It is only to be hoped that it retains people who are capable of operating the instruments.

On the meteorological side there does not seem to be so much reason for satisfaction. During the war "Meteor"—as the weather-service was commonly called—was reasonably good at guessing the weather for the next few hours, and sometimes for days, ahead. But since the war, either owing to defective communications or the lack of interest among observers, one hears that information concerning the weather even in this country has been anything but accurate.

Of all our sciences that of Meteorology seems to be the most backward. Those responsible for it seem to have their heads too much in the clouds in a metaphorical sense and not enough so in a practical sense. If some of the Meteorological Office officials did some flying they would doubtless learn quite a lot.

The notes concerning maps and the lighting of regular air routes are interesting, but not precisely informative. Something more might be said about these subjects in future communiqués.

Concealed Information.

Doubtless the fact that the Synopsis itself has been compiled by the Department of Information under General Swinton accounts for the modest brevity with which this department is dismissed. Its activities are described thus :—

(*g*) Collation of Information.—Technical information is collected and collated by the Information Branch from the various foreign journals with a view to assisting the constructive side of the industry, civil and Service. From time to time, as thought necessary, technical memoranda on different subjects are issued. The Research Branch of the Air Ministry is kept supplied with information, as also is the business community interested in civil aviation.

In regard to foreign markets, close co-operation has been established with the activities of the Department of Overseas Trade and the various naval and military attachés. By these means British firms are supplied with information in the form of periodical summaries, on such matters as foreign aviation, amalgamation of foreign aircraft firms, regulations and bye-laws affecting civil aviation in foreign countries. During the past two months 45 special notices have been sent out through the Society of British Aircraft Constructors, and numerous requests from British firms for information on urgent questions have been received and answered.

This branch is also responsible for the issue of Official Press Communiqués on all questions affecting civil aviation.

One is glad to hear that so much information is collected and disseminated by this branch, for one confesses to a lamentable ignorance of the fact hitherto. In the good old days when there was a war on, the Technical Department had a sub-department under Major Prance which used to collate technical information concerning enemy aircraft compiled by such eminent writer-artists as Captain Wilfred Aston and Mr. Gordon Crosby, and used to send this to the mere Technical Press, who used to publish it for the education of all in the Aircraft Industry and its ancillary trades.

Since the cataclysm of this devastating peace (to quote Lieut.-Col. Mervyn O'Gorman) no such information has been issued for the education of the ὁι πολλοι of the Aircraft Industry. No doubt—as the Synopsis tells us so—"technical memoranda on different subjects are issued." But they seem to be confined to the consumption of the managing director or the office-boy of the firms to which they are addressed. One has seen none of these memoranda oneself, nor has one heard any of them discussed by practical technical men among aircraft makers and users, as was always the case in the days of war.

Nor has one heard any discussion among the commercial people in the Aircraft Industry concerning "information in the form of periodical summaries on such matters as foreign aviation, amalgamation of foreign aircraft firms, etc." Presumably the circulation of these also is confined to managing directors and office-boys, so that the information does not percolate to such base varlets as sales managers, foreign representatives, and so forth.

Perhaps if the Department of Concealed Information kept more closely in touch with the Technical Press it might be helped in making its "periodical summaries" and "technical memoranda" better known and more appreciated among those for whose benefit they are presumably issued.

So far as "Official Press *Communiqués* on all questions affecting civil aviation" are concerned, one is the first to acknowledge that these are excellently adapted to their purpose. They are admirably suited to the mental capacity of the editorial staffs of the daily news-sheets to whom they are communicated.

Moving "Meteor."

In a previous paragraph one has perhaps indicated that the Science of Meteorology is a trifle backward. It is therefore of interest to learn that "Meteor" is to be moved. The Synopsis records the fact thus:—

(*h*) Meteorology.—To no other form of human activity are the vagaries of the weather so vital as to aviation. Information of air currents, and more especially of mists and fog, may make the difference between success and failure. For this reason, and although the claims upon a Government meteorological organisation of the Army, the Navy, the Board of Agriculture and Fisheries and other bodies concerned were fully recognised, it was recently decided by the Cabinet to transfer the Meteorological Office and attach it to the civil aviation department of the Air Ministry. With the exception of one or two details, the arrangements for this transfer are now complete.

As much as possible of the personnel, etc., are being moved from South Kensington to Kingsway; but lack of accommodation makes a complete transfer at present impracticable. A new Meteorological Committee has been formed, with the Controller-General of Civil Aviation as President, and Sir Napier Shaw, Director of the Meteorological Office, as Chairman. On this Committee the Royal Society has two representatives, and the Admiralty, War Office, the Board of Agriculture and Fisheries, the Board of Trade and Colonial Office have each nominated one representative.

Endeavours are being made further to assist scientific research, and, in addition to the ordinary routine work of the Meteorological Office, special attention is now being devoted to the requirements peculiar to flying.

A system of weather maps is being produced at six-hour intervals from information supplied by a network of R.A.F. and Civil Meteorological Office Stations, and reports and forecasts covering various aerial routes have been prepared and issued, together with maps showing the speed and direction of the upper wind over each.

In connection with the Cape-Cairo route, a statement has been drawn up showing the annual variations of the weather by months.

Special attention has been given to the London-Paris route, for which the service of weather reports is being improved. Good communications are vital to an efficient meteorological service and in this particular some difficulty is necessarily experienced in dealing with the large area and many foreign countries now concerned. All countries signatory to the Air Convention undertake to carry out certain arrangements with regard to communications; but the speed in setting up a through system must necessarily be that of the slowest country.

One of the first steps consequent upon the transfer of the Meteorological Office to the Air Ministry has been the closing down and elimination of many R.A.F. meteorological units called into existence during the war. General after-war requirements for meteorological information have been considered, and a scheme formulated providing for the least possible number of stations necessary. The policy followed has been to obviate overlapping between flying and non-flying meteorology.

The personnel of all meteorological stations at home is being placed on a civilian footing. Where service personnel is employed, as for instance in Egypt, it will be trained by the Meteorological Services. The necessary steps for the demobilisation of Service personnel and their substitution by civilians have been taken.

The formation of the mixed Meteorological Committee is distinctly interesting. It occurs to one that if it included one or two working members of farmers' co-operative societies and a few sea-going members of the Seamen's and Firemen's Union it might get more practical information on what weather is and why than it is likely to obtain as at present constituted. Also a few experienced cross-country pilots might be of value.

The "closing down and elimination of many R.A.F. meteorological units" may be a financial necessity, but it is much to be regretted, for some of these units included men with a "weather sense" which was more valuable than all the pseudo-science of the old Meteorological Office. It is to be hoped that some of those men may have been discovered and attached to the new organisation.

Such an organisation is a vital necessity to Civil Aviation, and one hopes that it will soon become at least as efficient as our telephone system.

Our Abandoned Airships.

We next come to the very sore question of civilian airships. This great subject is covered in one brief and pathetic paragraph thus:—

(*i*) Airships.—Although the rigid airship has not been exploited in this country to the same extent as the aeroplane, the commercial possibilities of this type of aircraft in connection with long-distance flights are fully realised. By the curtailment of the Government airship programme, a certain number of airships, in various stages of construction, became available for civil enterprise. A public meeting was held to explain the position, and those interested were invited to consider the formation of a company with a view to taking over these surplus airships and to investigate the commercial value of this type of aircraft. The formation of this company is now under consideration.

One believes firmly that for the long-distance passenger air lines of the future, such as New York-London, New York-Paris, London-Petersburg, London-Calcutta, Calcutta-Melbourne, and so forth, the airship is a better vehicle than the aeroplane or seaplane, though for mail-carrying relays of aeroplanes will be faster. It is therefore of interest to learn that the formation of a company to take over our abandoned airships is under consideration.

One cannot help thinking that if the great airship-building firms, namely Airships Ltd., Armstrong-Whitworth's, Beardmore's, Short's, and Vickers Ltd., were to pool a certain amount of capital and form a co-operative business to operate existing ships, they could make it

pay its way as a joy-ride concern. Thus they would learn enough to make it worth while to build new and improved ships for long-distance passenger lines. It will be of great interest to see how the existing negotiations develop.

The D.C.A. Staff.

Finally the matter of the Staff of the Department of Civil Aviation is discussed as follows :—

(*j*) **Staff.**—The staff of the Department of Civil Aviation on October 31st consisted of a total of 143, of which 52 are administrative officials and 91 clerical subordinates, at a total salary of £50,000 per annum. These figures include the Air Ministry meteorological staff, but not the personnel of the Meteorological Office recently transferred to the Air Ministry.

It should be borne in mind that the staff of the Communication, Accidents, and Meteorological branches are engaged on technical work for both the civil and Service sides.

The selection of a staff to deal with the many questions involved has not been an easy task owing to the fact that the Department must in the nature of things be a civil one, and that those officers possessing the requisite administrative and technical experience can usually be found only among those who have served in or with the Royal Air Force. It has been impossible until conditions are more certain to offer fixity of tenure in the Department of Civil Aviation and the terms of appointment have been necessarily brought into unfavourable comparison with the improved rates of pay recently conceded to the Royal Air Force. The result has been that recruitment has been difficult and slow. Steps are being taken to remedy this.

The Staff of the D.C.A. has been the subject of much discussion among all those concerned with Civil Aviation. It has been very generally said that though the individual members of the Staff are excellent their number is inadequate to their task. This appears evident when one learns that there are only 52 administrative officials and 91 clerical employees.

The fact that they have to administer only 241 aeroplanes, 374 pilots, and 258 ground engineers does not really affect the question. Their duty is to organise the Department so that it can deal with the future expansion of Civil Aviation. And from that point of view they are obviously too few, even if each and all of them were a genius in his own way.

Such complaints of delays and hindrances as are laid against the D.C.A. are not against the individual official, but against the general system, which is due to the parcimony of the Treasury. And where complaints against officials are justified it will frequently be found that the official in question belongs to another Department working in conjunction with the D.C.A., as for example the R.A.F. doctors who turned own the pilot mentioned early in these notes, or incapable A.I.D. officials who remain in the A.I.D. because they cannot get jobs outside and can command influence inside.

As the Synopsis suggests the pay and conditions of service in the D.C.A. are uniformly bad. Yet a number of very good men are accepting very bad money because they believe in Civil Aviation. The more honour to them. But, if the Treasury refuses to pay the D.C.A. Staff adequately and refuses to permit a staff of adequate size, it seems fairly evident that Civil Aviation would progress better without the Department of Civil Aviation.

Such, at any rate, is the opinion of a good many people in the Aircraft Industry, who believe that the money which is being spent on the D.C.A. might be better spent in subsidising air lines.

Things in General.

The Synopsis is ended by a general consideration of work done. This reads as follows :—

St. Paul's Cathedral and the River Thames as photographed from an Airco biplane.

III.—GENERAL CONSIDERATIONS AND CONCLUSIONS.

This brief summary of the work carried out during the last six months, and the organisation of the Department of Civil Aviation has been written as a record of work done. If it appears that a useful purpose will be served it is proposed to issue a further Synopsis at the end of another period of six months. No attempt has been made to suggest the potentialities of civil aviation. The speed at which it will develop cannot be gauged even approximately, but the possibilities are undoubtedly great, and there seems no doubt that when once the postulates of reliability, safety, comfort and economy have been met, as they will be, civil aviation must play an increasingly important part in the development of civilisation.

It is in any case, perhaps, not too much to say that when civil aviation has developed it will be the main reserve of strength from which the R.A.F. will draw in times of stress. The R.A.F. of the future should be capable of rapid expansion and of the organised assimilation of large numbers of personnel and material at short notice. As the mercantile marine reinforced the Navy during the war, so should civil aviation be regarded as the potential reserve of the R.A.F. in future crises. This source of supply can only be regarded as satisfactory if civil aviation is in itself a healthy and well-developed body. The building up of such a body on a true basis is largely dependent upon the growth of a steady demand for quicker communication. Irregular and spasmodic demands keep the cost of such communications at a high figure, and do not, therefore, assist development.

The carriage of mails promises to be one of the most important and regular demands which can serve to develop civil aviation, and to place aerial transport concerns on a firm footing. The future of aerial mail services lies on those routes where a material saving of time can be effected so that a definite commercial advantage may be obtained. In England, railway communications and distances are such that letters posted at the end of the business day can be delivered early next morning at almost every large town by the regular train services. The Postmaster-General is doubtful, therefore, whether the demand for express mails during the day-time between the more distant towns in the United Kingdom is likely to be sufficiently extensive to meet the considerable expense of running such a service for mails only. But if commercial services were established for passengers and goods, the opportunity would be taken to utilise them for express letters.

The line of development of aerial mails would seem to lie more on the continental and Imperial routes where the long distances give more scope for the element of speed. For example, in normal times the ordinary time of transit by railway is 36 hours to Turin, 48 hours to Rome, 23 hours to Berlin, 58 hours to Christiania, and 24 hours to Berne. Over such distances the potential saving by aerial transport is considerable. If such acceleration could be obtained, and regularity of service kept up, sufficient correspondence might be attracted to enable the extra fee to be fixed at a relatively small figure. When regular services to extra-European countries become practicable, the gain in time will be still more marked.

The more such services can be brought into being, the larger is the area over which the overhead charges are spread, and the lower becomes the cost of each additional service which automatically produces an increased demand for such service on routes where high cost has hitherto negatived the desire for speed.

It has been the object of the Department to ensure the safety both of the flying and non-flying public, without imposing irksome restrictions on the various firms concerned. In numerous problems on which technical advice has been required, the Department of Civil Aviation has received the assistance of the directorates of research and aeronautical inspection of the Department of the Director-General of Supply and Research, which is a separate Department in the Air Ministry from that of civil aviation. Hitherto all machines employed by civil aerial transport firms have been converted war machines, and although numerous new types are on the stocks, it may be said that no true commercial machine has yet appeared. Divergencies in type and construction between service and civil aircraft will, however, rapidly appear.

Partly owing to the difficulty of determining the future composition of the R.A.F., and the consequent uncertainty of what aerodromes will be required by the Service, it has not yet been possible to settle the aerodromes to be retained by the civil side, and to complete negotiations with the municipalities and others concerned. An Advisory Committee has been discussing this and kindred problems, together with the question of Imperial air routes, and their report is expected shortly.

The work of the Department must necessarily be of a pioneer character. The results of its labours—if indeed the foundations of the new scheme of things have been well laid—can only become visible in their entirety in years to come. Had the spade work not been done, however, it is doubtful whether this country would have been able to inaugurate and maintain the first international air services.

It may be questioned whether civil aviation in England is to be regarded as one of those industries which is unable to stand on its own feet, and is yet so essential to the national welfare that it must be kept alive at all costs.

If this question is answered in the affirmative there appear to be three methods of assisting it:—

(1) By means of direct Government subsidies—it is in this way that France has decided to act, and 18,000,000 francs have already been earmarked for this purpose.

(2) By recognising that *at the beginning* the British aircraft industry cannot stand on its own feet, and that to ensure its existence, although foreign to usual British practice, some form of *direct* Government assistance, probably in the shape of a grant to approved aerial transport companies for mileage and weight carried, is a necessity.

(3) By following the principle usually accepted in this country, that if an industry is to survive it must stand as nearly as possible by itself, and that a policy of "doles" is unsound. In this case the assistance given would take the indirect form of the provision of certain "key" aerodromes and shed accommodation at home and on the Empire routes; and the collation and issue of information, including meteorological date, and the provision of communications.

The problem is how best to tide over the difficult transition period through which we are passing. Adhesion to the British principle of independent private enterprise will undoubtedly be right eventually, but if a limited industry is to be maintained—as it must be to meet the requirements of the Royal Air Force—it is for consideration whether it will not be necessary to adopt a combination of (2) and (3) above.

(*Signed*) F. H. Sykes,
Controller-General of Civil Aviation.

Air Ministry, *November 1st*, 1919.

It is interesting to learn that another Synopsis will be published six months hence. It will cover the worst part of the year, including the present months in which our fatuous Postmaster General has chosen to start a London-Paris postal service, apparently with the sole object of demonstrating the truth of his statement some months ago that an aerial post is only 60 per cent. efficient. Therefore the next Synopsis will probably be properly depressing, so as to act as a deterrent on those who are cheerfully preparing for an Aero Show at Olympia in July—very cleverly fixed at the very worst time of the year, so as to interfere with joy-riding, and so late as to preclude any possibilities of orders for exhibitors.

The view that Civil Aviation will be to the R.A.F. in the next war as the Mercantile Marine was to the Navy in this war is optimistic. It assumes that Civil Aviation is going to be a bigger thing than the R.A.F. and very much more efficient. One can only hope that the optimism may be justified.

For once the Postmaster-General is right in suggesting that postal air lines in England cannot pay. It will be noticed, however, that nothing is said about postal lines to Ireland, which would probably pay very well, if letters were charged at reasonable prices and not at that absurd 2s. 6d. per ounce.

A Grave Mis-statement.

There is one grave mis-statement in this section, namely that "hitherto all machines employed by civil aerial transport firms have been converted war machines." The compilers of the Synopsis have apparently forgotten that the Commercial Vickers "Vimy," the F.K. Bat, and the Westland Limousine are commercial machines designed *ad hoc*, and bear no resemblance to war machines.

It is fully consonant with the custom of this country that there should not have been sufficient official encouragement to justify either of these excellent machines being put into production for regular use on air lines. One hears, however, that the Westland Co. have very pluckily put their limousine into production as a speculation, in full faith that there will be a big demand for genuine civil aerial transport machines next year. Is it possible that the Civil Aviation Department is so supremely ignorant as to be unaware of these facts?

Standing Alone.

The question as to whether Civil Aviation is unable to stand on its own feet and so must be supported in some way as essential to the Nation is one which may be debated *ad nauseam*. One's personal view is that it would be better to cut the Aircraft Industry loose and let it stand or fall on its merits. Hardships in youth give strength to the adult.

But if the Industry is to stand on its merits as an Industry it must be free from special rules and regulations and must only be controlled by the Common Law of the land. That is to say it must not steal, it must not kill, and it must not be a nuisance.

Nevertheless the suggested subsidies are of interest. One suspects Sir Frederick Sykes of having written this particular part of the Synopsis himself. One's own belief is that if subsidies are to be given at all they should be given in the form of direct subsidies to mail-carrying lines only, and that those lines should be left to please themselves whether they build or buy their machines.

Grants to manufacturers or operating firms, except as payment for work done, are unsound and help to keep alive those who are lacking in enterprise. But if the Government agree—as they have done with steamship lines—to hire enough cargo space daily (for mails) to pay for the running of the line, then the firms can carry passengers as well, and every passenger fare will then be pure profit.

One cordially agrees with Sir Frederick Sykes that "adhesion to the British principle of independent private enterprise will undoubtedly be right eventually." But if it is to be right, that private enterprise must be free from official interference.—C. G. G.

THE DOUGLAS-PENNANT CASE.

The Report of the Select Committee of the two Houses of Parliament inquiring into the Douglas-Pennant case was issued on Dec. 8th as a Parliamentary paper (No. 243). It contains a condemnation of Miss Douglas-Pennant's actions and statements in connection with the W.R.A.F. and her dismissal therefrom almost unrivalled in Parliamentary history. The mass of the public will be pleased to hear that the case is now concluded for ever, and that the Government action in the matter has been completely vindicated. A brief report of the case and the findings of the Committee will be published in the next issue of this news-sheet.

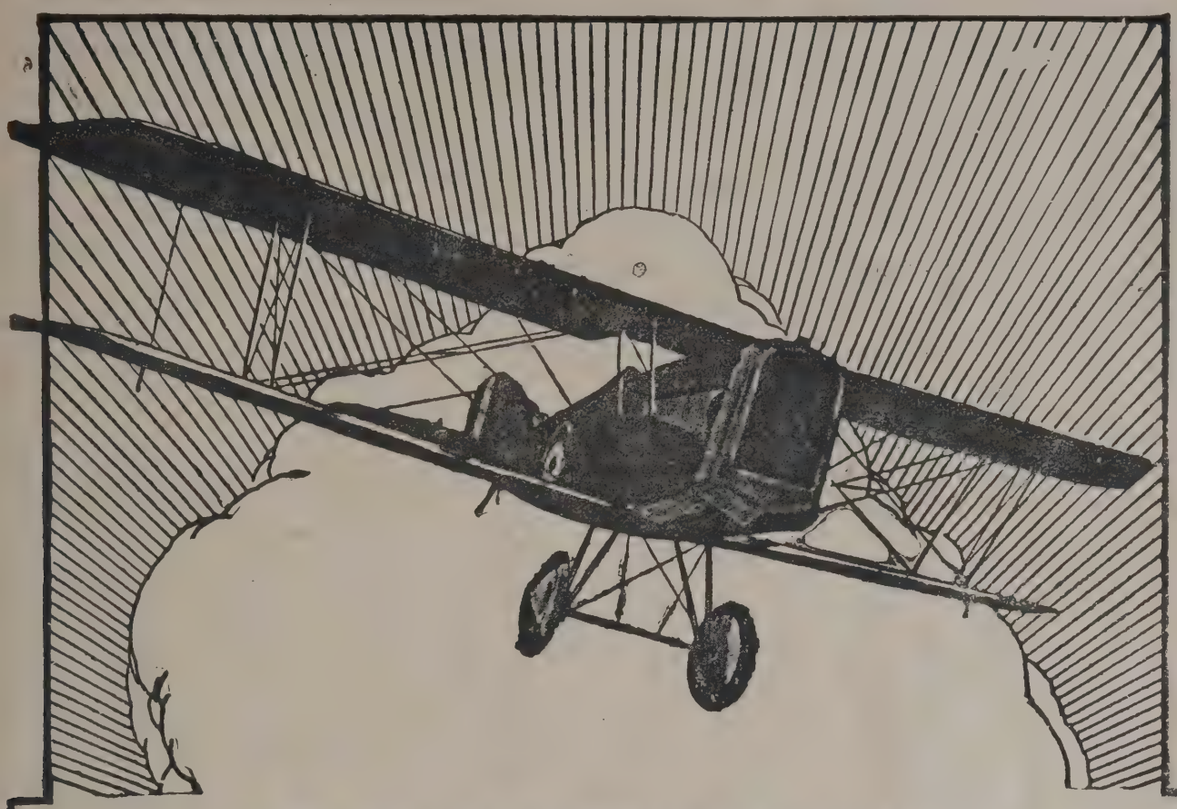
THE MINISTRY OF MUNITIONS AND THE EARL OF ROSEBERY.

The unconscious humours of the Ministry of Munitions do not fade. Recently that department has been advertising Turnhouse Aerodrome for sale by auction. The land on which this aerodrome is situated belongs to Lord Rosebery, who discovered the curious intentions of the Ministry of Munitions apparently by accident. He wrote a letter on Nov. 29th to "The Scotsman," of which the following is an extract :—

"I cannot help being surprised at this [the advertised sale] because I am under the impression that the farm belongs to me, and not to the Ministry. At first this might seem to be due to adoption of Irish methods by our Ministers, but I do not wish to exaggerate and I do not think it is due to lawlessness, but simply to gross carelessness from the fact that the Government, during the war, have so abridged the rights of individuals that its numberless departments have come to the conclusion that these no longer exist."

Apparently he received a reply, the sense of which is given in the following extract from a second letter to "The Scotsman" on Dec. 3rd :—

"I wish I could flatter myself that I understand the unsigned communication which you call the Government reply to my letter. So far as I can follow it, the department claims the right to purchase the land on which they have placed their unsightly buildings. However, from that right to the right to advertise it for sale without communicating with the person who, after all, is the owner, there is a very long step. I still think that for anyone, whether a Government department or not, to advertise the sale by auction of land which does not belong to them is a lawless proceeding and a dangerous precedent. If I were in arrear for rates and taxes I presume that the Government would take some such course. But even then they would be obliged to give me notice. In this case there is not, so far as I can see, a shadow of excuse for their procedure.



"'Oh, but,' says the department, 'we only offered it by auction to ascertain the value.' This is a privilege denied to individuals, who are supposed to act on their own judgment. But would it console me, if I found that my watch had been sold or pawned, to be answered by the pickpocket that this was only done to ascertain its value? The 'answer' only confirms me in the conclusion of my last letter : 'The Government during the war have so abridged the rights of individuals that its numberless departments have come to the conclusion that those no longer exist.'"

One waits expectantly for the next effort in departmental humour.

[Note.—Lord Rosebery has addressed a communication to Sir Howard Frank. This letter will be dealt with next week.]

SPECIAL BRITISH AIRCRAFT CONSTRUCTORS' ISSUES.

The Paris Aero Show begins on December 19th. On December 17th THE AEROPLANE will publish the first of Three Special Issues devoted to the products of British Aircraft Constructors. These Special British Aircraft Constructors' issues will provide a complete review of the British Aircraft Industry while the French Aircraft Industry is enjoying the advantages of its Exhibition. Copies of these issues should be ordered in advance so as to assure delivery. If desired, copies will be sent by post for 7d. from The Aeroplane Publishing Offices, 61, Carey Street, W.C.2.

THE ROYAL AIR FORCE AND THE FUTURE.

On Nov. 15th the following letter, headed "Gen. Seely's Resignation," appeared in the "Times" newspaper :—

Sir,—General Seely's resignation of his post as Under-Secretary for Air raises two important questions :—First, is there the necessity for a separate Air Ministry? Secondly, is there the necessity for a separate Air Force? These two questions should not be confused. It may be necessary for the future development of aviation that the Air Ministry should retain its independence. Upon that point I do not feel qualified to give an opinion. But the necessity for the retention of the Royal Air Force on a basis of independence of War Office and Admiralty control seems to me to be very much open to question.

As a chaplain to the R.A.F. I have had considerable opportunity of estimating the efficiency of its organisation and administration. I have come to the following conclusions :—

(1) The discipline and administration of Air Force stations, being in the hands of (in the majority of instances) extremely youthful officers, who have risen to senior rank by skill and gallantry in the air during war service, could be much more efficiently and economically carried out if such stations were under purely military (as opposed to Air Force) control, and commanded by Regular military officers of senior rank.

(2) Military and naval officers, who have transferred to the R.A.F., can never work in harmony, their traditions and methods of discipline being diametrically opposed to one another. The same applies to all ranks.

(3) The training required for naval flying officers is entirely different from that required for military flying officers. A naval or military officer can be taught to fly in six months, whereas a pilot cannot be made an efficient naval or military officer in under six years.

(4) The higher control of the R.A.F. administration could easily be carried out by the War Office with but a comparatively slight increase of personnel, thus releasing a large majority of the staff at present employed at the Air Ministry. Under the existing arrangement every administrative branch is unnecessarily duplicated.

I therefore am strongly of the opinion that the best interests of the nation would be served if the Royal Air Force should cease to be a separate organisation, and that the naval and military branches of the Flying Service should once more be placed under control respectively of the Admiralty and the War Office.

I am, Sir, your obedient servant,

Salisbury, Nov. 13th. Ex-Chaplain, R.A.F.

"Ex-Chaplain, R.A.F.," summarises in his letter the views which are strongly held by a number of well-informed officers who have had experience of the flying services throughout their history. The Royal Air Force in its existing state pleases nobody save a few politicians whose love for publicity directs their daily action and a few officers whose best interests are served by the existence of a separate service in which they can hold positions of relative grandeur.

It has been a happy habit in public life to describe the War Office as a monument of inefficiency designed to spend the nation's money with careless disregard of economy and to win wars unwillingly by the aid of enthusiastic amateurs whose services are accepted ungraciously and rewarded with habitual meanness. In common with all public labels the description is meticulously inaccurate. The public, with a customary lack of precision in its observations, collects readily every scrap of scandal relating to the science of offence and each derogatory detail affecting any department which, having employees in uniform, can readily be confused with the War Office, and then, rendered happy by the mass of unpleasant matter, lays it all at the door of the Secretary of State for War.

The Genesis of the R.A.F.

In accordance with this pleasing principle the primary reason given by the politician agitators for the creation of the Royal Air Force was that the War Office, deeply embedded in the superstitions of past ages, was incapable of giving enlightened attention to the needs of the Royal Flying Corps, whose duties were based on the use of a far-reaching invention of modern times. The Admiralty, secure in the methods and traditions of Nelsonic days, was left undisturbed by abuse. Their lordships at that time had little interest in aviation, did not appreciate its importance in war, and were not unwilling to allow the Royal Naval Air Service to disappear.

Two other major reasons for the creation of a separate Air Force were (i) the alleged necessity for unity of control and (ii) the assumed inability of the War Office and Admiralty to develop and control the vast aerial arms of the future.

Disunited Control.

It is a little hard to understand in what manner unity of control has been gained by the creation of the Royal Air Force. Administration and supply are, it is true, centralised under one staff. Control in operations remains almost exactly as before save that the complication is greater and there are certain obvious disadvantages.

In the operations of war the Air Force detachments serving under the Army or the Navy are directly under the orders of the Military General Staff or of the Naval Higher Command. That is to say, a third service exists which in part of its existence is managed by its own officials and in the remaining part, that for which it was primarily created, is governed by the orders of two other services from which it has an entirely separate *vie intime*.

Administration in the Air Force need not necessarily differ from that common in the Army. The latter service has a well-tried system, the defects of which have been eliminated during the long history of the Army. Supply—though the articles required are different—can be maintained in the same manner as is the supply of guns, ammunition, motor-cars, etc., to the military forces. The aeroplane is rapidly reaching a stage of existence in which the attributes of the various types are similar. There is little to choose between the fighting machines made by any of half a dozen firms, and none can be said in justice to be of much higher efficiency than the remainder. Therefore the simplicity of ordering is greatly increased. The flying arm asks for the desired machines, and the Supply Department executes the order. But this procedure does not necessitate the existence of a separate Ministry. The duties of the War Office and Admiralty are diverse enough to admit of additional responsibilities without courting disaster.

Decayed Aviators.

There is an additional reason why it would be of advantage if the Royal Air Force were abolished and the Royal Flying Corps and Royal Naval Air Service were revived. There are many pilots who become unfitted to fly either from loss of nerve or because of physical disability. These pilots are not necessarily suited for staff or administrative work. In the Royal Air Force there is no other outlet for the energies of disabled pilots. If, on the other hand, the sea and land flying arms were part of the Navy and Army personnel to whom piloting had become distasteful might be transferred to other units or sections of the respective services, provided their mental and moral qualifications were suitable.

Flying arms of the two services would also have a ready source from which to draw personnel. Officers whose devotion to their regiments and the Army are the predominating interest in their lives would willingly be seconded to a flying unit which was an integral part of the Army, yet few of them would go to an independent service even temporarily. *Esprit de corps* is of vital importance in the fighting forces, and it should be fostered and preserved with every care.

London-Paris
Air Express

Mails—Parcels—Passengers

DAILY TIME TABLE.

HOUNSLOW (depart)... 12.30 p.m.
LE BOURGET (arrive) 2.45 p.m.

LE BOURGET (depart) 12.30 p.m.
HOUNSLOW (arrive)... 2.45 p.m.

Mails

By arrangement with the British and French Post Offices an express air-mail is now carried daily on this route. The fee is 2s. 6d. an ounce, over and above the usual rates of postage, and letters which are handed in during the morning in London, up to the times indicated, and at the Post Offices specified below, will be delivered in Paris by about 4 p.m. the same afternoon.

G.P.O., King Edward's Buildings, 11 a.m.; Threadneedle Street, 10.45 a.m.; Lombard Street, 10.45 a.m.; Parliament Street, 10.45 a.m.; Charing Cross 10.50 a.m.; W.C. District Office, 11.10 a.m.; W. District, 11.15 a.m.; S.W. District Office, 10.40 a.m.

Passengers

The passenger fares are as follows:—Single, £21; return, £42. This fare includes free conveyance by motor-car to Hounslow Aerodrome from any point within a mile of Piccadilly Circus, and also conveyance by motor from Le Bourget into Paris. Similar arrangements exist as to the journey from Paris to London. A passenger, called for at an hotel in London at 11 a.m., arrives at the door of his hotel in Paris by 4 p.m. the same afternoon.

Parcels

The rate for parcels is 5s. 1b., but in the case of parcels weighing more than 2 lbs., or for regular consignments, much lower rates can be quoted If handed in up to 10 a.m. at the agents specified below, parcels will reach Paris the same afternoon; whereas by land and sea, even if a special "Grand Vitesse" fee is paid, a parcel is several days, and perhaps a week, in reaching its destination.

Full particulars regarding freights can be obtained from Aircraft Transport and Travel, Ltd., 25-27, Old Queen Street, S.W.1., or from the American Express Co., Queen Street and Haymarket; Thos. Cook & Son, Ludgate Circus, E.C., and 38-39, Piccadilly, W.; General Transport, Ltd., 52, Crutched Friars; J. Jackson & Sons, 7-8, Charing Cross, and King William Street, E.C.; Henry Johnson & Sons, 18, Byward Street, and Beak Street, W.; Carter Paterson & Co., 6, Maddox Street, W., and 3, Cannon Street, E.C.; Lep Aerial Travel, Piccadilly Circus (Criterion Corner); and Hernu, Peron & Co., 98-100, Queen Victoria Street, E.C.

NOTE.—Parcels are received up to 10.30 a.m. at the two depots mentioned above of the American Express Company; or up to as late as 11.30 a.m. at the Hounslow Aerodrome.

THE DESIRABLE C.O.

The first conclusion of "Ex-Chaplain" is that, in order to maintain discipline and all that is therein implied, senior Regular military officers should command stations. Supporters of the R.A.F. say that in many cases senior military officers have failed lamentably when in command of R.A.F. units. There are certainly cases of this kind on record, but I think it will be found on inquiry that these officers were not regarded as efficient when in the Army and only transferred to the R.A.F. because their career in their own service was not proceeding with the distinction they believed to be their due.

Promotion in the Royal Air Force has proceeded mainly on two lines. Those who have fought gallantly and have proved themselves daring leaders in action have become squadron leaders and wing commanders with automatic ease. Skill in the office, on the other hand, has also brought many to high rank. Neither of these classes are necessarily qualified to command any unit. The greatest test of the commander is a period of inaction. In war-time and on active service the defeat of the enemy is a sufficient inspiration to prevent demoralisation in personnel. But peace-time, with its deadly routine, its monotony, its painfully slow rate of promotion, makes difficult the preservation of efficiency and the observance of the amenities of life among men whose physical fitness makes apparent stagnation entirely unattractive. It is then that the commanding officer of long experience and inborn tact is necessary. Such people are hard to find in a new service where, until the present, the main habit has been the breaking of old traditions without the creation of new principles.

There is no need to discuss his second conclusion. Naval and military officers will never work in harmony. It is not the difference in the work so much as the dissimilarity in initial training which sends them along divergent roads.

His third conclusion is also obviously true. The necessary knowledge of the principles governing the operations of the Army differs totally from that of the Navy. Both are vast in extent and their acquisition to the instinctive degree takes years of experience.

His fourth and final conclusion is the most important of all. The staff at the War Office in peace-time, though it could not be reduced, is not fully occupied at all times and could with ease cope with the additional work of directing and administering that share of the R.A.F. which properly would come to the Army where it redivided. A few additional staff officers in each of the great departments of the War Office would be desirable and an additional member of the Army Council would be essential. In matters of Q.M.G. services the requirements of the aerial arm could be met without any additional help.

THE REPLY OFFENSIVE.

But such a letter as that of "Ex-Chaplain" is provocative of replies, and two at least have appeared in the "Times" during the past week. The first of these is signed "Ex-Flight Leader" and bears internal evidence of the truth of many of "Ex-Chaplain's" statements. Dealing with the question of discipline he says:—

". . . the individual flying officer is allowed to exert more initiative than his military brother. He is not so closely fettered by rusty chains of obsolete etiquette and hard and fast rules. Nor is it to be desired. In the career he has adopted he is never called upon to meet a situation which is exactly paralleled by a preceding one; and as a consequence has no need for manuals and regulations written in an age long since passed away. But he does require a leader; and in the very essence of things he prefers a comrade who has proved his worth in 'actualities' to a relic of ancient days, dug up, may be, from a Reserve battalion or an A.M.I.O.'s office, or to an ex-Brigadier whose only excuse for appointment would be, 'We must find him a job somewhere,' and whose interest in aviation began and ceased the night that the Hun bombed his chateau in France."

This passage is offensive without being in the least true. Of all branches of all the fighting services the aerial arm adheres most closely to routine in action. What difference is there between any number of aerial fights? The same acrobatics, the same system of endeavours to outmanœuvre, obtain. In flying each awkward incident is countered in a set manner laid down by experience.

A flying officer in the R.A.F. is concerned with flying alone. He is not responsible for the well-being of his men. He is never charged with their control in action. His life, except during his hours of fighting, is one of ease and comfort. Compare this with the existence of an infantry subaltern either behind the lines or in the trenches. In the first case he must give constant attention to the training, comfort, and amusement of his men. In the trenches he is never free from danger, and he has the responsibility of the lives of the personnel immediately under him.

The manuals and text-books at which "Ex-Flight Leader" jeers are those which, though not "written in an age which has passed away," convey the experience of warfare amassed throughout the centuries to the unfledged warriors produced in a national emergency. As to the "obsolete etiquette" which annoys "Ex-Flight Leader," one imagines it to be those conventions by which the life of the decently born is regulated. Inexperience in these matters often produces annoyance, but in time he himself would have found the social code to be of use.

Later he says:—

Before April, 1918, the R.N.A.S. had enjoyed the pick of machines and engines. With the coming of the Air Force a better and juster apportionment of the good things in aviation ensued, with strikingly successful results on the *moral* and efficiency of the new arm.

As the Royal Air Force only came into existence seven months before the Armistice, any credit for its good work overseas must be given to the Army and Navy from which it was drawn. Can anybody say with honesty that either the *moral* or the efficiency of the R.A.F. were higher than in the R.F.C. and R.N.A.S.?

In a very offensive passage on the War Office he says that "he would indeed be a bold man who dared to affirm that the War Office is competent to handle the Army with thorough efficiency." One must be grateful that courage is not lacking in England to-day, for there are many thousands of officers, all of whom are well qualified to judge, who believe fervently in the efficiency of the War Office and who regard it as having by far the most creditable record of all the Government offices.

The Higher Command of the Army realise that aviation is an essential element of war, and it is inconceivable that they would or will in any way fail to give adequate support to the new arm. Experiments never attracted the soldier, for it must not be forgotten that for each invention which has proved a success there are many thousands which have failed lamentably.

"A CRITIC IN PALL MALL."

The Lord Montagu of Beaulieu also wrote a reply to "Ex-Chaplain, R.A.F.," which appeared in the "Times" of Nov. 20th. The text is as follows:—

ONE ELEMENT: ONE SERVICE.

To the Editor of the "Times."

Sir,—The proposal of the Government to put the Royal Air Force again under the War Office should be resisted by every one who has the future of the Air Services at heart, or remembers the past history of the previous bad system now proposed to be revived.

First of all, I desire to allude to the past. When I was a member of the War Air Committee with Lord Derby and others, in the spring of 1916, my experience then of the difficulties in regard to supply and administration which arose from the dual control of the Air Force by the Navy and Army, and the impossibility of harmonious working, led me to resign as a protest against the waste of time, lives, and money under the old system, and in order to bring to public

notice that the independence of the Air Service was essential for its progress and proper efficiency. The same reasons which led the Government to accept this view hold good to-day.

The Air Force should remain independent, free to work out its own salvation, to create and carry on its own traditions, and alone to be responsible for its own efficiency in offence and defence throughout the Empire.

Then, as now, some Cabinet Ministers and some exalted naval and military authorities were bitterly opposed to the independence of the new force, and some of these authorities had either actively hampered or passively resisted the progress of the Air Force since its early days. Later on three factors compelled the Government to grant the Air Force independence :—

(1) The pressure of both Houses of Parliament and public opinion.

(2) The need of an Air Force for war purposes larger than that which could be controlled by either the Admiralty or the War Office.

(3) The weighty and explosive arguments in London and elsewhere of the Zeppelins, which showed every one that war in the air was a very real and increasingly important part of the great European struggle.

Thus the first Air Ministry and independent Air Force was formed under Lord Cowdray in the autumn of 1917. [All this is history.]

Now what of the future? It would be madness to imagine that the need of an efficient Air Force will be less in future. It will be far, far greater. Both by sea and land, air power will become more and more important actually and relatively every year, both in peace and war. And the possibility of sudden, blinding, annihilating attacks by an enemy, without a declaration of war—an enemy panting for vengeance—will grow with every year. Has the War Office knowledge, time, or ability to think out the special problems of the air, or administer efficiently this novel, peculiar, and wonderful force, whose pilots must always be pilots before they are sailors or soldiers, brave beyond telling, and reckless in initiative to the verge of insubordination? Of the two I would rather put them under the Admiralty, where initiative is understood, and insubordination, if successful, winked at.

And, Sir, it should be enough for most people to know that General Seely has resigned on this most important question of principle. There has never been a more capable Chief of the Air Ministry, one with more vision, experience, practical knowledge, and belief in the future of the Air Force. He has been Secretary of State for War, still is a member of the Imperial Defence Committee, and has worked the Air Force under both systems, dependent on the War Office and independent of it.

And, finally, let us remember that while we are all war weary, war is still possible, even probable, in the future. Germany is crippled on the sea and on land. In the air she can build up—and is building now—a force for peaceful commerce which in 24 hours could be used for war with deadly effect. The first week's air warfare may decide the next war.

Any independent Air Ministry, though its estimates and personnel be small, is preferable to no Ministry at all, and to the overshadowing and deadening influence of another Department. Three years ago I wrote, "One element : one Service." That, Sir, is as true a motto to-day as then.

Yours faithfully,

House of Lords, Nov. 10th. MONTAGU.

It is written in the manner one would expect from Lord Montagu of Beaulieu, a nobleman who has played with the problems of the internal combustion engine and its application as his ancestors played with politics and literature in the centuries which now are dead. Gifted with mental activity above the average and possessed of talents which suggest the kindly intervention of fairies at his birth, he, like Philippe, Duc d'Orleans, Regent of France, lacks the one inborn gift which would enable him to put his powers to their finest public use.

He speaks of his membership of the War Air Committee in 1916 and his resignation because of the "impossibility of harmonious working." Has there ever been a Committee which succeeded in initiating direct and prompt action in time of war? Is it possible to find agreement in councils on which soldiers and sailors sit with equal powers? The answer is surely "No." One would suggest that the real failure indicated by Lord Montagu's letter was that of the Committee. Had the R.F.C. and the R.N.A.S. been less hampered by the interference of Committees and Boards manned by political and scientific theoreticians their work would have been simpler, the confusion would have been less.

Later in the letter he admits that exalted authorities were in bitter opposition to the formation of the Royal Air Force. Who is to say that these authorities thought with less wisdom than the heterogeneous band of minor politicians, Fleet Street journalists, and disgruntled aviators who brought about the formation of the Royal Air Force?

The Three Factors.

He gives three factors in the compelling of the Government in the matter of the birth of the Royal Air Force. His first matters little, as Parliamentary and public opinion are swayed easily by multitudinous extraneous passions uncontrolled by pure reason or logic, and both were ever ignorant of questions affecting military science.

His second is a matter of opinion. A War Office designed to direct and maintain an army of a million men satisfactorily produced and controlled forces seven times that number. Is it reasonable to assume that the relatively small addition of an aerial arm would bring about the disintegration of the War Department whose war experience had brought it the power to think easily in millions, an attribute rare in all other departments save the Treasury?

The third factor is curious. According to this the air raids over England assisted in the birth of the Air Force. The war is responsible for many strange midwives. It is odd in view of this argument that the anti-aircraft defences of this country were a part of the Army, commanded by a major-general, assisted by an exclusively military staff. It will be generally admitted, I think, that those defences were effective, and that the despised War Office has at least one considerable success to record in its annals.

The Seely Touch.

There is the true spirit of General Seely in a later passage of his lordship's letter :—"Has the War Office knowledge, time, or ability to think out the special problems of the air or administer efficiently this novel, peculiar, and wonderful force, whose pilots must always be pilots before they are sailors or soldiers, brave beyond telling, and reckless in initiative to the verge of insubordination? Of the two I would rather put them under the Admiralty, where initiative is understood, if successful, winked at."

That blind eye of Nelson is still doing its deadly work! It is consoling to note that Lord Montagu realises the connection between his form of initiative and insubordination. "Unity is strength," and insubordination (even in the "initiative" form) is destructive of "unity." There are a few cases of insubordination which have brought about great and effective results in action. We hear of these. They are well advertised. But nothing is said of the "initiative" which has brought about countless disasters because of its destruction of the unity essential in war. The use of intelligence is vastly more important in hostilities than is careless, self-satisfied "initiative." The soldier who understands the principles of his profession and is capable of applying them on all occasions shows initiative of the true order. He is the type of soldier to be encouraged, and the records of the war show that his class is large. On many occasions the tide of battle might have turned in our favour had pilots and observers in all cases carried out their orders strictly, before entering into little campaigns of their own, which, however attractive, were nevertheless useless to their country.

Lord Montagu ends his letter with the phrase, "Three years ago I wrote, 'One element : one Service.' That, Sir, is as true a motto to-day as then." It is surely

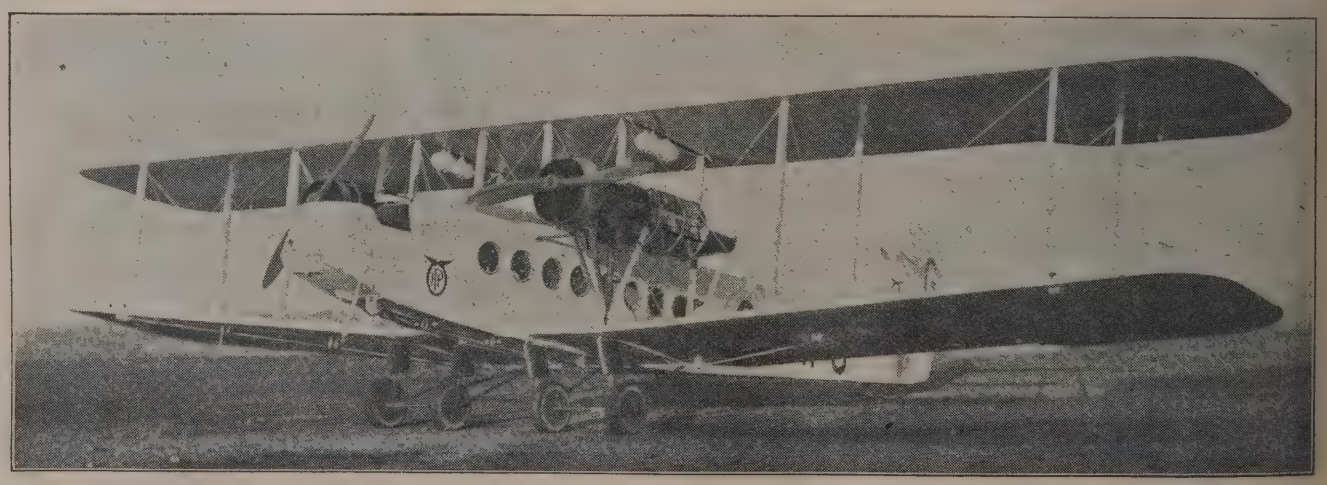
a little unkind that his lordship in his disbelief in the qualities of the soldier and sailor should wish to deny them the right to breathe!

Other letters in this correspondence appeared on later dates. The Lord Sydenham, than whom there have been few greater administrators in the history of the Empire, wrote to the "Times" on November 29th and Dec. 5th, supporting the existence of a separate Air Force. In the first letter written to support Lord Montagu he says, in essence, that the Air Force "has a psychology of its own, and it will never reach the full measure of achievement unless it develops a distinct air policy and is trained in peace and directed in war by flying men." His second letter emphasises the importance—according to his school of thought—of the claims of the Royal Air Force to complete independence. "There is greater reason for independence in regard to the R.A.F. than in regard to the Army and Navy."

Admiral Sir Reginald Custance and Maj.-Gen. Sir John Davidson also wrote letters on this subject.

By far the clearest and most convincing contribution to this discussion is a letter from Maj.-Gen. Guy Dawnay which appeared in the "Times" on December 5th. The following extract will explain itself and the general trend of the whole letter:—

> Only by the very fullest measure of co-ordination will it be possible to fit the Air Force into its proper place in the complete military (which, of course, includes naval and aerial) machine. And further, to each arm or service its own tactics; but it is a main essential that air forces working with Navy or Army should be thoroughly familiar with, should have most detailed knowledge and understanding of, naval and military tactics respectively. Moreover, as strategy is all one, there must be no risk of an independent Air Service devising divergent or unrelated theories in the region of strategy, or even in the borderland of "grand tactics." But these desiderata cannot be ensured without either a combined Ministry of Defence or, as General Davidson urges, a Joint General Staff, or both; nor without a most comprehensive scheme of attachment of Air Force *personnel* for thorough training with the older Services.
>
> On the second point—the provision for the Navy and the Army of efficient organs of their own—what is the position? Of the Navy I shall not presume to speak, but the outlook, at least as regards the Army, is dubious. In the sense in which cavalry used to be called "the eyes of the Army," aircraft rather may now be so called. But if aircraft are the eyes of the Army, the Army has no eyes of its own. Yet in modern war eyes of its own are more than ever necessary; it is no longer mainly a matter of strategical or tactical reconnaissance, for modern artillery requires eyes of distant vision incessantly. In ten years' time, will the young Air Force officers know enough about warfare on sea and land, enough about naval and military tactics, to undertake reconnaissance efficiently for Navy or Army? In ten years' time, will they know enough of artillery on sea or land—highly complex subjects—to be able to co-operate with that arm afloat or ashore to fullest advantage? Ten years' complete independence without some exceedingly strong co-ordinating factor might easily produce a dangerous loss of efficiency in co-operation. No one who saw the working of the Dardanelles Expedition from within can disguise from himself that, in spite of the most loyal, admirable, and unbroken harmony between Navy and Army in that instance, considerable obstacles are placed in the way of perfect co-operation between two Services when mutual understanding of the tactical views and requirements of each other is not complete throughout, when the staff systems of the two are utterly different, and when the heads of either may report independently to independent Ministries at home.
>
> The creation of an independent Air Ministry after the early part of the war may have been the best means of coping with a very difficult situation at a time of great stress. But, as Admiral Custance indicates, the decision appears to have been taken mainly on grounds connected with administration, and such grounds are not the essential. As for the desirability or otherwise of its continued independence, the only body fully competent to advise would be the Joint Imperial General Staff, for which General Davidson asks, and which, as he truly says, could be established without delay. In the absence of a Defence Minister, it would report presumably to the Committee of Imperial Defence. Such a Staff would also consider, and would alone be fully competent to recommend, means for securing to the Navy and the Army necessary organs which the present divorce of the Air Force seems to withdraw from them; or, alternatively, means for promoting and maintaining full efficiency under the existing system if possible.



The Air Question is not settled yet. Like Home Rule, it may serve to wreck Governments, to make or break political reputations. The creation of new Ministries has during the war been regarded as the panacea for all ills, the ointment which cures all diseases.

We may perhaps hope that peace will lead to simpler decisions and that bureaucracy may be induced to depart from a country in which it has never been popular. A surer cure for political evils of the present day may perhaps be found in a reduction in the number of Ministries, and among the first to go—as a political redundancy—should be the Air Ministry.—W. E. de B. W.

THE PARIS AERO SHOW.

M. André Granet, Commissaire-General of the International Exposition of Aerial Locomotion in Paris, which opens on December 17th, intimates that by decree of the President of the Republic, dated November 8th, the location of the Exhibition in the Grand Palais has been constituted a entrepot reel for purposes of customs.

That is to say, for all intents and purposes the Grand Palais becomes a Bonded Warehouse, and all exhibits therein are free from customs duty so long as they remain there. Consequently machines sent from abroad to be exhibited at the Grand Palais can be despatched direct to the stands allocated to them under the ordinary International transit regulations by means of all offices open for such purposes.

The new "W.8" Type Handley Page Biplane (two 450 h.p. Napier "Lion" engines), which, on its maiden trip to Paris on Dec. 4th, completed the journey in 2 hr. 10 min.

Telephone : WILLESDEN 2455.

Telegrams : "NIEUSCOUT, CRICKLE, LONDON."

GREAT BRITAIN.

FROM THE "COURT CIRCULAR."

Buckingham Palace, Dec. 3rd.

The King held an Investiture in the Ball Room of the Palace at 11 o'clock this morning. The following were severally introduced into the presence of His Majesty, when the King invested them with the Insignia of the respective Divisions of the Orders into which they have been admitted :—

The Most Excellent Order of the British Empire (Military Division).—Dame Comdr.—Dame Helen Gwynne-Vaughan, W.R.A.F.

The Most Distinguished Order of Saint Michael and Saint George.—Companion.—Wing Comdr. Geoffrey Brierley, R.A.F.

The Most Excellent Order of the British Empire (Military Division).—Commanders.—Miss Josephine Fairfield, R.A.F.M.S.; Brig.-Gen. Robert More, R.A.F.; and Wing Comdr Douglas Powell, R.A.F.

Officer.—Lieut.-Col. Donald Cameron, R.A.F.

His Majesty then conferred decorations as follows :—

The Military Cross and the Distinguished Flying Cross.—Capt. Frederick Haney, R.A.F.

The Military Cross and the Air Force Cross.—Capt. Oliver Stewart, R.A.F., and Flying Officer Bernard Smith, R.A.F.

The Military Cross.—Capt. Charles Denning, R.A.F.; Lieut. Eric Varley, R.A.F.

The Distinguished Flying Cross and Bar.—Capt. Richard Hilton, R.A.F.

The Distinguished Flying Cross and the Air Force Cross.—Flying Officer John Stubbs, R.A.F.

The Distinguished Flying Cross.—Sqdn. Ldr. Maurice Le Blanc-Smith, R.A.F.; Capt Harold Hillier, R.A.F.; Flight Lt. Noel Keeble, R.A.F.; Capt. William Leete, R.A.F.; Flight Lt. Humphrey Leigh, R.A.F.; Lt. Edgar Harris, King's Royal Rifle Corps, attached R.A.F.; Lt. John Hodgson, R.A.F.; Flying Officer Thomas Horry, R.A.F.; Flying Officer Frederick Hunt, R.A.F.; Lt. William Hurrell, R.A.F.; Observer Officer John Kendrick, R.A.F.; Lt Ralph Keys, R.A.F.; Lt. John Latchford, R.A.F.; and Flying Officer George Lingham, R.A.F.

The Air Force Cross.—Wing Comdr. Reginald Rodwell, R.A.F.; Sqdn. Ldr. Charles Nicholas, R.A.F.; Maj. Maurice Noel, The King's (Liverpool Regiment), attached R.A.F.; Maj. Leslie Peter, R.A.F.; Maj. Sebastian Smith, R.A.F.; Flight Lt. Lionel Payne, R.A.F.; Capt. Lawrence Sloan, Cameron Highlanders, attached R.A.F.; Lt. Ralph Park, R.A.F.; Lt. Francis Silwood, R.A.F.; Lt. Harry Slingsby, R.A.F.; Lt. Edward Sullock, R.A.F.; and Sec. Lt. Eric Priest, R.A.F.

Buckingham Palace, Dec. 4th.

The King held an Investiture in the Ball Room of the Palace at 11 o'clock this morning.

The following were severally introduced into the presence of the King, when His Majesty invested them with the Insignia of the respective Divisions of the Orders into which they have been admitted :

The Most Distinguished Order of Saint Michael and Saint George and the Distinguished Service Order.—Companion.—Wing Comdr. Andrew Board, R.A.F.

The Most Distinguished Order of Saint Michael and Saint George.—Companion.—Group Capt. John Becke, R.A.F. (also received the Air Force Cross).

The Most Excellent Order of the British Empire.—Officer.—Military Division.—Lieut.-Col. Max Freeman, R.A.F.

His Majesty then conferred decorations as follows :—

The Military Cross and Bar.—Flight Lt. Arthur Jones-Williams, R.A.F.

The Military Cross and the Distinguished Flying Cross.—Flight Lt. Vivian Champion de Crespigny, R.A.F.

The Military Cross.—Capt. Stuart Cole, R.A.F.

The Distinguished Flying Cross.—Capt. John Middleton, R.A.F.; Capt. Horace Porter, R.A.F.; Flying Officer Edward Arnold, R.A.F.; Flying Officer Geoffrey Bailey, R.A.F.; Lt. Eric Furlong, R.A.F.; Flying Officer Malcolm MacEwan, R.A.F.; Flying Officer George Machin, R.A.F.; Flying Officer Ian McDonald, R.A.F.; Flying Officer John Milne, R.A.F.; Flying Officer George Moffoot, R.A.F.; Flying Officer Arthur Newman, R.A.F.; Flying Officer Jaffrey Nicholson, R.A.F.; Flying Officer George Pargeter, R.A.F.; Lt. Joshua Parke, R.A.F.; Lt. George Pitt, R.A.F.; Lt. Robert Reece, R.A.F.; Flying Officer Frederick Stevenson, R.A.F.; and Lt. Frank Stott, R.A.F.

The Air Force Cross.—Sqdn. Ldr. Albert Butler, R.A.F.; Sqdn. Ldr. Ernest Wilberforce, R.A.F.; Capt. Henry Kendall, R.A.F.; Flight Lt. Edward Pretyman, R.A.F.; Capt. Bernard Windeler, R.A.F.; Capt. Arthur Wright, R.A.F.; Capt. William Wright, R.A.F.; Flying Officer Frederick Hyde, R.A.F.; Lt. George Sewell, R.A.F.; Lt. Frank Taylor, R.A.F.; Lt. Leslie Taylor, R.A.F.; Lt. Richard Wainwright, R.A.F.; Lt. George Waugh, R.A.F.; Flying Officer Edward Westall, R.A.F.; Lt. Henry Whitby, R.A.F.; Flying Officer Archer White, R.A.F.; and Flying Officer Cecil Wigglesworth, R.A.F.

NAVAL.

Regression!

The Admiralty has approved the removal of the kite-balloon platform and the replacement of the main mast on all sloops proceeding on foreign service, or with the post-war fleets.

Aviation in the Baltic.

According to the correspondent of the "Morning Post," at the end of November the British air stations on the shores of the Gulf of Finland were dismantled and moved onto the warships. This fleet will, it is expected, remain in the Gulf during the winter, using Reval as a base.

MILITARY.

The War in Afghanistan.

The following is extracted from a telegram despatched from India on Dec. 1st. The telegram gives some particulars of the Afghan campaign, but it is uncertain whether the telegram is official :—

"Air operations against the Mahsuds continue. On Nov. 27th seven tons of bombs were dropped and 8,000 rounds of small arm ammunition fired. On Nov. 28th three and a half tons of bombs were dropped and 5,200 rounds fired. Good results were obtained."

Some sections of the Mahsuds have now definitely asked for peace owing to the air raids, but their request has been refused.

The Mahsuds' villages are still being bombed, and will probably be further intensified in the near future if no general submission is made. On Nov. 22nd Sarwakai and Kot Kai were bombed.

AIR FORCE.

H.R.H. the Prince Albert.

On Dec. 2nd Capt. H.R.H. the Prince Albert, K.G., R.A.F., was admitted to the Order of Freemasons at Princes Galleries, Piccadilly, in the presence of the Prince of Wales, many Grand Lodge officers, and a distinguished company of Freemasons generally. Surgeon Lieut.-Comdr. Louis Greig, R.N. (Wing Comdr., R.A.F.), was also initiated. An emergency meeting was held for the dual ceremony.

This was performed by the Pro Grand Master, Lord Ampthill (in the regrettable absence of the Grand Master, the Duke of Connaught), and the Master of the Lodge, Vice-Admiral John B. Eustace, R.N.; while the Deputy Grand Master (the Right Hon. T. F. Halsey) addressed the candidates.

Prince Albert was presented as "Lieutenant His Royal Highness Prince Albert Frederick Arthur George, K.G., R.N. (Flight Lieutenant, R.A.F.)," and his Equerry as "Surgeon-Lieutenant-Commander Louis Greig, M.V.O., R.N. (Wing Commander, R.A.F.)."

Owing to his connection with the Navy Prince Albert has joined the Navy Lodge, No. 2,612.

An Honour for Lord Londonderry.

St. James' Palace, Dec. 5th.

The King has been pleased to approve of the following appointment :—

The Most Hon. the Marquess of Londonderry to be a Knight of the Most Noble Order of the Garter.

The Demobilisation of the W.R.A.F.

The Women's Royal Air Force was finally demobilised on Dec. 4th. The W.R.A.F. are the first women's corps to have a Women's Comrades of the War Association, and it is intended that this shall be run on the most democratic lines and have branches practically everywhere that demobilised "Wrafs" are to be found. The committee consists of four officers and six other ranks, and the president is Dame Helen Gwynne-Vaughan. There are an officer secretary and a "ranker" secretary.

BELGIUM.

The Chevalier Lt. Willy Coppens, the Belgian aviator, has been appointed Air Attaché to the Belgian Embassy in London. He was awarded both the Cross of the Order of Leopold and the Cross of the Order of the Crown.

CZECHO-SLOVAKIA.

The Italian correspondent of The Aeroplane writes :—

Lieut. Lepar and a non-com. officer of the Bohemian nationality crashed inexplicably when flying an ex-Hun biplane near Milevek on Nov. 26th. Lieut. Lepar had been with Pégoud in France and had the distinction of having piloted that great man. On the same day another machine, with an army pilot, Provaznic by name, and also a mechanic on board, fell to earth at a place called Tabor, in Bohemia, both men being lost.—T. S. H.

HOLT LANDING LIGHT

NOTICE:—It has come to the notice of the Yorkshire Steel Co., Ltd., that the DISPOSAL BOARD is offering Holt Landing Light Equipment for sale. It is necessary, therefore, to point out that this apparatus is Patented in England and various foreign countries and can only be used under Licence from this Company. Further, the Landing Flares are only guaranteed by us for six months, while those offered for sale are much older and their use would entail very serious risks to Passengers and Machines.

THE YORKSHIRE STEEL COMPANY, LIMITED,
HEAD OFFICE: **30, HOLBORN, LONDON, E.C.1.**
Makers of Life-Saving Parachutes and Parachute Flares, etc., etc.

18 NEW RECORDS

On Nov. 22nd, Capt. Gathergood, piloting a 450 h.p Napier Engined Airco 9R machine, secured the following 18 Official British Records :—

Longest distances in ¼ hour, ½ hour, 1 hour and 2 hours.

Greatest speed over straight flight of 5 Kilometres.

Greatest speed in closed circuit for 5, 10, 20, 30, 40, 50, 100, 150, 200, 250, 350, and 400 Kilometres —without alighting.

in 1 day, on 1 machine, with THE ONE LUBRICANT

WAKEFIELD Castrol REGD. (R)

C. C. WAKEFIELD & CO., LTD.,
Wakefield House, Cheapside, London E.C.2.
and 21, Rue du Mont Thabor, Paris.

DENMARK.

The Danish correspondent of The Aeroplane writes :—

One of the Danish army pilots ordered to France for advanced training, Serjt. Johansen, has been killed at the Le Bourget Aerodrome, his Breguet biplane catching fire in mid-air.

A Gift.

As a token of appreciation of the kind reception received at the Copenhagen naval air station, the Danish-American millionaire, John Larsen, has presented the Navy with his new, large Curtiss flying-boat, with self-starter, said to be the only one of its type in Europe.—Hi.

FRANCE.

A Reorganisation of the Aerial Arm.

On Jan. 1st next the present Groups of Escadrilles will be formed into Aviation Regiments. All officers at present in the aerial arm who desire to be posted to the new regiments on the administrative staffs are requested to submit their names to the Director-General of Military Aeronautics, stating in order of preference the garrisons to which they wish to be attached.

A Medical Board.

The Directorate of Military Aeronautics has opened a temporary Medical Board at 5 Square du Trocadéro, Paris, for the examination of candidates for military aeronautics. This Board will at a later date be transferred to Le Bourget. Candidates who fail to pass the required tests will return to their original arms of the service.

The Resignation of Capt. Heurteaux.

Capt. Heurteaux, having been elected to the Chamber of Deputies, has been placed on the reserve cadre of the 9th Hussars, but remains also seconded for service in aeronautics.

Refresher Courses for Reserve Pilots.

It has been decided that retired and demobilised military aviators will be permitted to take refresher courses on military machines, and that during these courses their expenses will be paid. Premiums will also be given under stated conditions. On the other hand, it is not stated as yet whether or not these pilots will, in case of accident, be entitled to consider themselves as under orders, and so be eligible for pension or gratuity.

A Burglary.

According to a Reuter report of Dec. 5th 40 aeroplane magnetos and a large quantity of tools have been stolen from the French aviation camp at Villacoublay.

A Naval Flight.

Lieut. Lefranc, a French naval officer, who left St. Raphael recently with a squadron of seaplanes to fly to Dakar (West Africa), completed the journey between Valencia and Almeria, a distance of about 440 kilometres (273 miles), in four hours.

A Flight to Morocco.

Commandant Vuillemin and Lieut. Dagneau, who both acquired merit recently in a flight from Paris to Cairo and back (though the latter was prevented from completing the return journey by air), reached Algiers on Dec. 2nd, having flown from Alicante, a distance of 340 miles, in 2 hr. 40 min.

They are to be under the orders of General Nivelle, and will make reconnaissances over the Sahara with a view to arranging an aerial link between the French military posts in that area.

An Accident in Turkey.

Two French military aviators, Lieut. Quinquandar and Adjudant-chef Serge Iline, flying on the military aerial post between Bucharest and Constantinople, were lost in a fog on Dec. 5th, and flew into the Chirchiloul hill in the Burzen district. The pilot and passenger were killed instantly.

HOLLAND.

An order has been issued by the Commandant of the Dutch Aviation Department forbidding further flights in Rumpler aeroplanes. It is understood that there have been four fatal accidents on these machines recently.

A Proposed Flight.

Lieuts. W. C. Versteegh and A. K. Steup intend to fly from Holland to the Dutch Indies together in one machine. Probably before starting on the journey these officers will, together with Lieut. Kopper, pay a visit of a month or so to England in relation to this big flight. It is the intention of the Dutch Government to send the three officers to England at the nation's expense.—G. M.

ITALY.

The Italian correspondent of The Aeroplane writes :—

Bad Weather Flying.

A squadron of seaplanes flying from Milazzo *via* Taranto to Naples—probably some of the machines from the seaplane station at the former place which, as mentioned recently, are extending their postal services—came to grief owing to running into foul weather and a violent wind along the Calabrian coast. According to one report, an F.B.A., No. 3250, with Nav. Lt Panarello in command and Seaman Santina pilot, came down and was sunk by the waves near Siderno. The crew were saved by Serjt. Spoto, who was flying a relief machine. Only two of the five machines were able to continue the journey on to Naples in the teeth of the hurricane.—T. S. H.

ROUMANIA.

A Capture.

It is reported that Roumanian troops have captured a large aeroplane which made a forced landing at Hotin, in Bessarabia, owing to engine trouble. The crew of the machine consisted of two German officers and three mechanics, who had with them 360,000,000 roubles for the Bolshevik troops in Ukraine, a printing machine to print banknotes, and several thousands of jewels of all kinds.

There appears to be a regular air service of this sort running between Germany and Russia. One seems to remember a similar capture made some little time ago.

RUSSIA.

A Bolshevist Haul.

In an official Bolshevist communiqué, dated Dec. 1st, it is stated that in the occupation of Bolshoe-Konushkino four seaplanes were included among the captured war material.

SWITZERLAND.

The Dubendorf Military Station.

Some figures are now available which show clearly the amount of flying carried out by Swiss military aviators from day to day. As far as can be discovered, there are 53 military aeroplanes at Dubendorf and two Albatros biplanes of the Austrian army interned during the war. There are about 35 pilots posted to the station. In the week ending Nov. 2nd the military pilots made 251 flights, totalling in time 79 hr. 8 min. and in distance about 5,950 miles. In the following week, owing to the cessation of aerial posts, the 224 flights made by military aviators only amounted in all to 43 hr. 34 min. flying over a total distance of 3,500 miles. During the month of October, 32 pilots made 1,416 flights of a total duration of 428 hr. 46 min. and a distance of 34,600 miles.

U.S.A.

Prohibited Areas.

Instructions issued by the War Department on Oct. 10th prohibit civilian flying over the vicinity of fortified areas within the boundaries of the United States, including the Panama Canal Zone.

DURING THE PARIS AERO SHOW THE CURRENT ISSUES OF "THE AEROPLANE" WILL BE SENT TO PARIS BY AIR AND MAY BE OBTAINED ON THE DAY OF PUBLICATION FROM :—

Mm. Hachette's Kiosks ; W. H. Smith & Sons, Rue de Rivoli ; and from the Stand of "L'Air" in the Grand Palais.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

A further instalment of the article on the experimental work carried out at Grain Air Station during the war is printed below; and describes some of the difficulties encountered in connection with the problem of landing machines on the decks of aircraft carriers and the early work of developing emergency flotation gears for land machines for use over the sea.

A paper by Major T. Vincent Smith, R.A.F., which was read before the British Association at Bournemouth in September, is reproduced in this issue.

This paper outlines the history of the war development of wireless communication with aircraft, and gives a vivid idea both of the difficulties which had to be overcome and of the success with which these difficulties were attacked.

Some machines produced by the Kondor Flugzeugwerke during the war are illustrated in the third instalment of the series on "Recent German War Machines."

A memorandum issued by the Air Ministry, dealing with the supply of instruments for aerial navigation, is reproduced on page 1928.

THE WORK OF THE MARINE EXPERIMENTAL AIRCRAFT DEPOT, ISLE OF GRAIN.—(*continued.*)

By Capt. W. H. SAYERS, Late R.A.F.

Reference has already been made to the early experiments connected with the deck landing problem made at Grain. From the middle of 1917 onwards the experimental construction depot at Grain became the centre of experimental work connected with the use of aircraft from ships. Deck landing arrangements were a part only of the general problem attacked.

Arresting Gears.

In the earlier days of experiment it had been assumed that the problem of arresting the forward motion of the landing aeroplane in the limited space available was the crux of the problem. Were this really the case the problem had been fairly easily solved, and the original wire rope landing deck, which consisted really in the provision of an artificial hill of rapidly increasing slope formed by a series of longitudinal cables anchored near the stern and rising in a catenary curve to a bridge some 30 feet above the deck level and about 100 feet farther forward, would probably have sufficed for many purposes.

So, too, with the later retarding device wherein a number of transverse wires attached at each end to sandbags, which were picked up successively by some form of hook on the machine as it traversed the deck and thus applied a continuously increasing frictional retardation.

Tests were made with this system on a planked landing platform at Grain, and it was found to be quite possible to bring a Sopwith "Pup" to rest in 50 feet from touching with only quite light head winds to assist in the process.

The Real Difficulty.

Unfortunately, actual attempts at landing on the deck of aeroplane carriers demonstrated that the actual retardation on deck was but a small part of the problem, and that the lack of width on deck was a more important matter than the absence of length.

With reasonably high speed ships it was possible to land with very small differences in forward velocity between the ship and the aeroplane, but owing to the generally disturbed air flow near the deck itself—caused by the relative speed of the ship through the air—it was very difficult to keep the machine on the deck, and particularly to keep it straight on the deck after it had lost flying speed.

The result was that having successfully established contact with the deck, the machine would slew to one side and roll over the edge of the deck with far too low an air speed to give any chance of picking up before striking the water, and more than one valuable life was lost through this type of accident.

It is to be remembered that the conditions are entirely different from those of a normal landing. With a 10-knot wind, and a 30-knot seaplane carrier, it is quite possible for the aeroplane to be flying at a negative speed relatively to the ship, and it is obvious that a machine may be on the deck with no forward velocity relative to the ship, and yet have an air speed little less than that necessary to sustain it in the air.

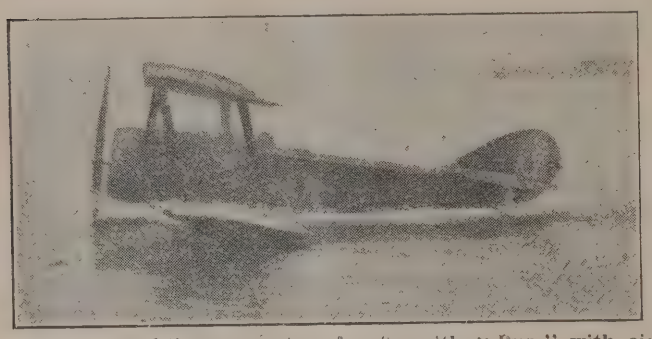
Under these conditions the wheels are obviously not rolling on the deck, and if an oblique gust causes the machine to skew, there is some risk of tyres being rolled off the wheels, which usually results in the machine spinning round on the rolled-off tyre. This actually occurred on several occasions, and appears to have been the cause of at least one fatal accident.

Skid Undercarriages.

To overcome this trouble experiments were made at Grain with skids, and a Sopwith "Pup" was fitted with skids attached to the axle in place of wheels, these skids being supported at their fore ends by an extra strut added to the normal Vee undercarriage. The skids were thus sprung in exactly the same way as the usual wheels and the machine so fitted was unexpectedly satisfactory. On any reasonable aerodrome it was possible to get off just as easily as on wheels, and the run after landing was considerably reduced.

The skids were much easier to taxi in side winds, and the performance of the machine was slightly improved.

The First Sprung Skid Chassis on a Sopwith "Pup." Note the hook for picking up arresting cables.



Later a rigid skid chassis was adopted instead of the sprung type—with some appreciable saving in weight and with no ill results.

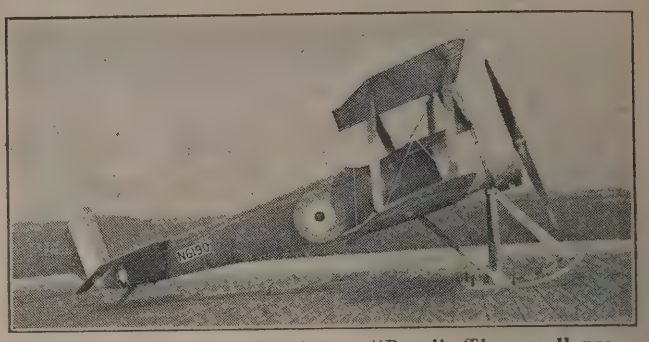
By way of holding down such a machine to the deck when it had once established contact, tests were made of a series of longitudinal cables stretched fore and aft along the landing deck, and the skids were fitted with projecting catches—on the principle of the dog-lead catch—into which two or more of the stretched wires would enter on alighting, thus positively holding down the machine and limiting the possibility of sideways movement to that allowed by the give of the wires themselves.

Altogether many and various types of arresting mechanism were suggested, designed, and tried at Grain, but, at any rate up to the date of the Armistice, the problem was far from a satisfactory solution.

Flotation Gears.

In the absence of satisfactory arrangements for deck landing, and the lack of seaplanes with a performance approaching that of land scouts, it became a habit to fit ships with Sopwith "Pups" and such-like small machines which could be flown off a deck and attack hostile airships, but which had either to fly back to land when their operations were

The first alighting on water of a Sopwith "Pup" with air bags and a hydroplane.



complete or else flop into the water close to a friendly ship in the hope that the pilot could be picked up. Putting an ordinary land machine into the water practically invariably meant losing the machine, and often the pilot as well, and machines used for this purpose were therefore usually fitted with air bags in the after part of the fuselage to keep them afloat.

Even so pilots found that a machine which floated tail upwards was an uncomfortable refuge in a wintry sea, and the engine generally benefited little by even a short submergence in salt water.

These facts led Squadron-Commander Busteed, while he was yet at Eastchurch, to consider the question of devising light flotation arrangements which could be attached to the normal land machine and would enable it to float right side uppermost, and eventually to produce the emergency flotation gear with which his name is associated.

In its original and simplest form this gear consisted of balloon fabric air bags, circular in section when inflated, attached to the lower wing of any ordinary type of biplane between the leading edge and the front spar. These bags were normally deflated and folded flat against the lower wing surface, to which they were held by a fabric flap permanently fastened along the leading edge of the wing and clipped to the front spar by eyelets which could be simultaneously released by pulling a string from the pilot's cockpit.

When thus folded the air bags merely slightly thickened up the front portion of the wing section, and produced no noticeable effect on the machine's performance.

The Rigid Skid Chassis fitted to a "Pup." The small projections on the skid in each side of the main Vee are horns designed to catch in longitudinal wires along the landing deck.

When it was desired to alight on water, the pilot first pulled the string releasing the flap, and then by turning on compressed air from a standard compressed air starting bottle into an air injector which communicated with the bags inflated the latter to their full capacity.

The inflated bags provided a large buoyancy ahead of the centre of gravity of the machine, and in conjunction with fuselage bags behind the C.G. kept the machine afloat in its normal attitude.

The First Trials.

The first machine on which the arrangement was tried out was a Sopwith "Pup" fitted with a dropping chassis released by the pilot before alighting. On touching the water the fabric on the underside of the fuselage ripped off, the water rushed in, and the machine nearly turned over onto its nose.

To remedy this trouble a stiff three-ply planing surface was fitted beneath the fuselage between the chassis strut attachments. A small plane of duralumin set at a negative angle was attached to the tail skid—in the hope that if it once got into the water the down load on it would hold the tail down.

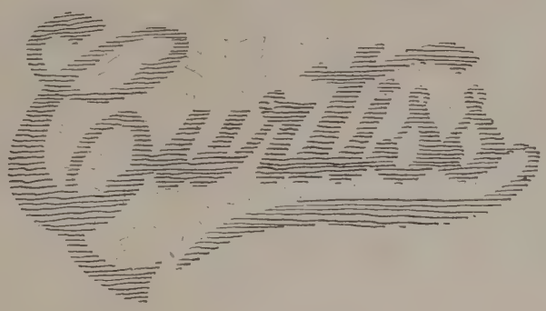
With these additions the machine was again tried, and alighted successfully at the first trial, and at many subsequent ones.

A photograph showing this machine at the moment of touching is reproduced. The planing board beneath the fuselage and the air bags beneath the wings can plainly be seen Another photograph shows the same machine afloat after several hours' test immersion in the mouth of the Thames.

The first "Pup," successfully fitted with air bags and a hydroplane, afloat after several hours on the water.

This actual machine alighted on water on several occasions and in no case did any part of the machine suffer any structural damage. Naturally it was stripped for examination and recovered between each test. After the first two trials the engine was taken down and overhauled, but thereafter it was found sufficient to wash it out thoroughly with paraffin, inject copious castor oil, and then give it a short run.

THE EDGAR ALLEN NEWS.



This interesting little periodical, published by Edgar Allen and Co., Ltd., for the dissemination of news of interest to the users of Edgar Allen's steel, has now reached its third number.

To those who habitually work with steel it will supply many useful hints, and even those who do not will find it provocative of thought.

All those who are seriously interested in the use of steel should apply to Edgar Allen and Co., Ltd., Imperial Steel Works, Sheffield, giving the name of the firm through which their interest arises, and copies will be forwarded to them as they appear.

A DEMENTI.

Rolls-Royce, Ltd., announce that there is no truth whatever in the rumour that they intend to place on the market during the year 1920 a Rolls-Royce chassis of 20 h.p.

FLYING BOATS; AERONAUTICAL MOTORS
AEROPLANES; HYDRO-AEROPLANES

THE CURTISS AEROPLANE AND MOTOR CORPORATION AND ITS AFFILIATED COMPANIES HAS ALWAYS BEEN THE DOMINATING CENTRE OF AVIATION IN AMERICA. ITS CAPACITY HAS STEADILY GROWN UNTIL TO-DAY IT IS THE LARGEST AND BEST EQUIPPED AEROPLANE MANUFACTURING CORPORATION IN THE WORLD, AMPLY PROVIDED WITH ALL FACILITIES FOR BUILDING A LARGE VARIETY OF TYPES OF AEROPLANES, HYDRO-AEROPLANES, FLYING-BOATS, AND AERONAUTICAL MOTORS IN *LARGE QUANTITIES* AND FOR *PROMPT DELIVERY*.

Member Manufacturers' Aircraft Association

WIRELESS IN THE ROYAL FLYING CORPS DURING THE WAR.

By Major T. Vincent Smith, M.C., R.A.F., M.I.E.E.

(A Paper read before the British Association.)

In the light of modern achievements, it is not easy to realise how profound was our ignorance on the subject of aircraft wireless in August, 1914

It is only by realising the insignificant amount of data existing at the outbreak of war that the details of the development of aircraft wireless assume a correct perspective.

It was obvious that observing for the artillery was one of the most important services that the Flying Corps could render, and for this purpose efficient communication was of primary importance. Only one machine of those which went with the original Expeditionary Force was fitted with wireless, and though a few had been added by the time I went to France in February, 1915, I found a rather cumbersome signalling lamp the most popular means of communication between air and ground.

Early Types of Apparatus.

The earliest form of spark transmitter we used was of the simplest possible kind, using an accumulator battery and closed oscillating circuit, the inductance of which was common to closed and radiating circuit in the form of the well-known auto transformer.

A wandering plug enabled the closed circuit to be tuned to the aerial, or the aerial could be brought into resonance with the closed circuit by lengthening or shortening.

There was another somewhat similar set made by Leslie Miller, but having an inductive coupling; another squadron was using a French engine-driven set, having the auto transformer coupling and a multiple rotary spark gap.

The power and weight of these three sets were, respectively, 40 watts, 50 lb.; 100 watts, 65 lb.; and 150 watts, 78 lb.

The ground receiving arrangements consisted of an 8-section 30-ft. tubular steel mast, a 150-ft. silicon bronze wire aerial, a rather unwieldy tuner, and two kinds of crystal detectors, also two pairs of Brown's high-resistance 'phones. Two copper gauze mats as counter-capacity completed the outfit. The tuner was eventually replaced by a good and efficient instrument.

A few days after my arrival I was appointed wireless officer to No. 3 Squadron of the 1st Wing, which comprised, in addition, Nos. 2 and 16 Squadrons. Each squadron consisted of 12 machines divided up into three flights of four machines, of which one flight was wireless, the remaining two flights worked with signal lamps.

The End of Lamp Signalling.

There was considerable rivalry between the lamp and wireless as a means of signalling, but the latter soon made the lamp method obsolete, when, owing to the success of the wireless flights, all machines in No. 3 Squadron were ordered to be fitted. The more the use of wireless extended, the greater were the difficulties that arose, but in spite of annoying failures it was justifying itself inasmuch as it would have been impossible to get through anything like the amount of work by other means.

One realised that the whole future of the application of wireless on a large scale in the Air Force in war depended upon the successful solution of the new problems which were constantly presenting themselves.

To do this demanded the fullest possible knowledge of the nature of the work, the conditions under which it had to be carried out, the personnel who did it, and finally investigation into the causes of failures with a view to their elimination.

These were done as far as possible, and by spending two days with each squadron, flying, keeping their machines in working order, and visiting the ground stations with the guns.

My front, which corresponded to that of the 1st Army, extended from Armentières to Mazingarbe, about 25 miles, and contained about 30-40 batteries. It was by far the most active piece of line and embraced the three most important operations of 1915, namely, the battles of Neuve Chapelle in March, Festubert in May, and Loos in September.

The first battle in which wireless became a serious factor was that of Festubert. Our preparations for this battle consisted of observing for the artillery whilst they registered their guns on the trenches and important points within the enemy's lines.

It is also memorable as being the first occasion upon which machines were specially detailed to observe the battle and to report progress by wireless. This work was done by No. 16 Squadron, under Major Holt, and four of their machines fitted with Leslie Miller transmitters kept watch successively all day over the battle.

As the attack did not develop, there was nothing much to report, but the wireless worked quite successfully and the machines remained in touch with their stations throughout the operations.

Foundations were thus laid which resulted in the development of that very important branch of aerial activity known as the close-contact patrol for the purpose of reporting infantry movements.

Another squadron, No. 10, had now been added to the Wing, and, apart from ordinary troubles, jamming or mutual interference steadily increased, but the experience gained by this time enabled one to begin reform and organisation in real earnest, and the first thing done was to standardise the apparatus.

Both for its light weight and simplicity, I chose the No. 1 transmitter and found immediate relief from jamming owing to the smaller power used by it. The effect of eliminating powerful signals was very marked and the simplification through having only one kind of transmitter materially added to reliability.

So much was this the case that all machines in the Wing, amounting to 48 in all, were ordered to be fitted.

Practical Difficulties Overcome.

I redistributed the wave lengths on the following plan:—The three flights of the most northerly squadron were given 100, 180, and 260 metres, the next squadron was given 140, 220, and 300 metres, and so on, alternately, down the line. The beneficial effect of this change was sufficient to meet the large increase in machines.

The transmitter was now taken in hand and a lot of useless connections removed, and the radiating circuit altered by disconnecting the aerial from the top of the inductance and attaching it to a wandering plug, thus enabling the aerial to be loosely or tightly coupled as required. The component parts were assembled in a neat gas-tight box and the inductance calibrated in wave lengths, thus reducing the weight of the whole set to 26 lb., including all fittings, and its bulk by one half. A further addition of 24 machines was made to our Wing. These naturally brought more trouble in their wake, as we now had 72 machines fitted.

To relieve the somewhat severe pressure I received permission to recommend four of my most suitable operators for commissions to take charge in their respective squadrons. This resulted in considerable diminution of failures, but the jamming trouble was again to the fore.

In reviewing the situation, and in the light of past experience, I determined to try the effect of reducing still more the power of the No. 1 transmitter, which was done with almost startling results.

The battery was cut down to three cells and the adjustment of the spark gap and primary make and break very carefully attended to, with the result that the rasping guttural splutter gave place to a pleasing flute-like note.

The effect was truly magical and gratifying, as not only were the operators delighted at the change, but jamming lost many of its terrors. In addition to which, owing to the power being reduced to 20 watts, the trembler and spark gap remained clean and in adjustment for a longer time and the weight of the battery was also reduced.

It was found that the trembler could be made to vary its note within small limits by careful adjustment. This was of great assistance to the operators and the soundness of these principles in the prevention of jamming was amply proved later on, when their development enabled the number of machines capable of working without mutual interference to be greatly increased.

A Sign of Enemy Inferiority.

Evidence of the success of our work was shown unmistakably by the attempt on the part of the enemy to jam us, a sure sign of their technical inferiority, more particularly as they entirely failed in their object.

About this time another very important detail was added to our organisation in the establishment of a squadron wireless control station situated between the guns and the squadron. It was connected to squadron and batteries by telephone and its prime duty was to listen to the machines working with their batteries and to take down as much as possible.

These records formed an invaluable means of locating causes of failure, as the assertion on the part of the pilot that he had sent a certain signal, or the operator at the battery that signals were weak and unreadable, received from the control station definite proof of their truth or otherwise. Another duty was to lay out a signal on the ground indicating to a machine on its way from the squadron to the lines the quality of its signals.

By this means a fruitless journey was saved to a machine whose apparatus was not functioning properly.

Owing to its situation, the control station was naturally freer from jamming than a battery station, consequently it was possible, owing to their being connected by telephone, to accept signals from a machine and phone them to a battery that was for some reason not getting its signals.

The first of these stations was started at Vielle Chapelle in May, 1915, though its full uses were not developed until later on.

In July the first introduction of the thermionic valve took place and one was brought out to demonstrate its powers of amplification. It was a Round valve of the soft type, associated with the Round magnifying circuit, and was very delicate in action, requiring considerable training on the part of the operator; but it obviously possessed great possibilities, and I reported accordingly.

WIRELESS WORK AT LOOS.

Preparations for the Loos offensive in September were now in full swing, and registration of the guns was the order of the day.

Over 600 targets were registered by the machines of the 1st Wing during the week preceding the offensive.

The battle took place and was a great opportunity for proving the use of wireless on a large scale, and it emerged triumphant. In spite of there being about 20 machines always working in the salient to about 60 ground stations with the guns, no serious failure took place.

Lord French's dispatch on the battle said :—"The R.F.C. is becoming more and more an indispensable factor in combined operations. In co-operation with the artillery in particular there has been continuous improvement both in the methods and in the technical material employed. The ingenuity and technical skill displayed by the officers of the R.F.C. in effecting this improvement have been most marked."

The war now settled down again to trench warfare.

About this time another small but effective improvement was made. I found that large capacity accumulators were conducive to failures owing to the mechanics forgetting when they were last charged. By substituting accumulators of sufficient capacity for only one spell they had of necessity to be recharged after every flight. Not only did this eliminate failures due to exhausted accumulators, but the weight of the battery was reduced by 25 per cent. and the whole transmitting set, including all fittings, to 18¾ lb.

THE FIRE DANGER.

Another matter arose demanding earnest attention, and that was danger from fire. Obviously the close association of the electric spark and petrol required that every possible precaution should be taken. A machine may crash when landing or by engine failure when trying to get off. In either case the petrol tank invariably bursts to the imminent danger of the pilot and observer. As a switch might easily be moved in the case of a crash I decided that the only really certain remedy was a complete disconnection of the accumulators from the wireless apparatus by means of a plug. This fitting was made compulsory throughout the R.F.C. and orders issued that no machine was to leave the ground or land again with its battery connected.

So far as I am aware no fire caused by wireless occurred after this.

In February, 1916, I was ordered to organise the wireless repair section of No. 1 Aircraft Depôt at St. Omer.

One of the most important things undertaken by this section was the fitting of all the machines as they arrived from England in the safest and most efficient manner instead of leaving it to squadrons to carry out. When it is remembered that only 20 watts were being used by the transmitters, the greatest care had to be taken to avoid leakage by conduction and induction.

The transmitter and its battery were mounted on a tray which slid into a little cupboard in the fuselage.

In the early days, officers were taught to adjust and tune in the air, but experience showed that it was much safer and better to leave all that sort of thing to be done by the trained mechanics on the ground. The whole set was entirely overhauled after each flight, and they were responsible that everything was in perfect order before the machine left the ground.

These precautions practically insured the apparatus against breakdown, and it was only natural that the pilots came to have implicit trust in the reliability of their wireless.

The confidence of the pilots was a very important factor in the success of wireless, and to gain this one had had to participate in and appreciate as far as possible some of their difficulties and dangers.

This knowledge profoundly modifies the design of any apparatus that can be used in war successfully.

THE NEED FOR SIMPLICITY.

To call upon a pilot to make even one adjustment may easily add 20 per cent. to the failures, and it was found by experience to be far better to sacrifice a certain amount of electrical efficiency and to provide apparatus which was able to do the work required and could be used by as many thousands of pilots as operations in all theatres of war might demand.

I feel called upon to make these remarks in defence of the 1 transmitter and in answer to the criticism of wireless neers who had no opportunity of appreciating the con- s under which this work was carried out on the Western

Early in 1916 Major Prince brought out a valve transmitter with telephony attachment of his own design. This was successfully demonstrated to Lord Kitchener, who was visiting France at the time. He was able to hear every word from a machine flying 40 miles away, and was much impressed.

I mentioned at the beginning of my remarks the absence of data from which we suffered, and an interesting fact developed in ascertaining the correct length of aerial for a definite length of wave.

Whilst this relation is well known for different kinds of aerials on the ground, I found the ratio in the air differed with each type of machine and presumably depended upon their different electrical capacities.

The ratio of one foot of aerial for a wave of one metre was true only within small limits, and after about 150 ft. of aerial for a 150 metre wave, different makes of machines required anything from 240 to 320 ft. for a 250 metre wave.

Amongst the requirements for the following year the need for a 100-mile transmitter was felt. Major Whiddington's spark transmitter, having proved its capability, was adapted provisionally until valves were sufficiently developed for this work, which occurred the following year.

Although the continual increase of the R.F.C. showed that the general principles already in use in wireless were sound, it was clear that an extension of the range of notes as distinct from wave lengths was desirable.

Accordingly, the wireless repair section set to work and produced a simple but very effective little device which was easy to fit to the trembler of the primary of the transmitter.

By a simple adjustment the note could be varied over a range of about six whole tones, thus giving a very great variety.

Our little workshop made them, and a flight in every squadron on the whole front was fitted in a month, and proved a great success.

I was appointed Officer in charge of Wireless at R.F.C. Headquarters in March, 1916.

RECEIVING IN THE AIR.

It became necessary to turn our attention seriously to the reception of signals in aeroplanes. The instruments hitherto sent out for trial had not proved satisfactory, and a G.H.Q. Intelligence report that the enemy was using such a device put our little wireless section on its mettle. With the assistance of Lieut.-Col. Blandy, of Wireless H.Q. Signals, three days later we were able to give a demonstration of the reception of signals from a standard Army station, by an aeroplane at 20 miles' range.

We used three valves associated with fixed coupled circuits designed for one wave length only. This made for extreme simplicity as the apparatus only required to be switched on to function without further adjustment.

The whole front was by now standardised and organised on the lines which had been found so successful in the 1st Wing, and preparations for the Somme offensive were put in hand.

A school was started at St. Omer to train operators in the latest methods and codes. This included an important development of arrangements for a moving battle and methods for putting the guns on to fleeting targets.

A part of H.Q. moved to an advanced position and an enormous concentration of all forces took place. As the time for the attack approached, the role of air co-operation became more and more important in neutralising the enemy's artillery fire and hampering his movements generally, and in ensuring the barbed wire in front of his trenches was effectively cut. As the Somme operations took place during July, August, and September when the days were very long, the strain on the operators of listening in from dawn to dusk was immense, especially as there were over 600 ground stations in the battle area with only one operator at each.

The arrangements for putting the guns on to fleeting targets worked splendidly, and over 100 signals an hour of this kind were dealt with at Group Headquarters. Co-operation with the infantry also proved successful, and similar arrangements had been made to work with the cavalry had they got through.

GOOD WORK RECOGNISED.

The work of the officers was not less strenuous than that of the operators, but we felt amply rewarded when at the close of operations the following special order of the day was published.

"The General Officer Commanding wishes to express his great appreciation of the work done by the wireless personnel of the R.F.C. during the present operations. They have very responsible duties, and the way they have carried them out, in spite of long hours under fire, has contributed in no small measure to the success achieved by our artillery.

"Wireless Officers are requested to bring this Order to the notice of all operators."

At the end of 1916 I was appointed to the Air Ministry, and when I left France the total wireless personnel numbered 200 officers and 2,000 operators and mechanics, or more than the total personnel of the R.F.C. at the outbreak of war.

The serious work of organisation, of training, supply, research, and policy for all theatres of war was undertaken, also Home Defence, which became a necessity at this time.

It was probably in training that the greatest effect was made, and by adopting a policy of intensive culture by instructors drawn from the Front, the personnel were sent to France ready to take up their work on landing, which led to the closing of the School of Instruction at St. Omer.

Specialisation was carried to its extreme and with standardised apparatus and methods the system proved itself fully justified, and an ever-increasing stream of officers and men poured out to France, all highly trained in their own particular branch of wireless, whilst periodical visits were paid to the Front by us all in order to keep thoroughly up to date.

Extremely good wireless work was done at the battles of Arras and Vimy Ridge.

In the latter operation the following figures are eloquent, and were officially reported as the work of the 2nd Wing working with 38 H.A. groups, 55 Divisional Artillery, and 187 Heavy and Siege Battery Stations :

256 Hostile batteries destroyed.
86 Gun pits destroyed and 240 hit.
103 Explosions caused.
229 Destructive trench shoots.
117 Successful registration shoots.
2843 Fleeting target calls received at Battery Station.
406 Artillery observation flights.
Wireless failures nil, working with
30 Machines simultaneously on a 7-mile front.

During 1917 continuous wave transmission and wireless telephony were developed to the point of standardisation and use at the Front. In the latter case intercommunication between the fighting machines in the air was leading to important results and a range of five to ten miles was achieved.

The visual reception of signals in aeroplanes utilising valves to work a relay was developed and demonstrated successfully in France by Capt. Murphy, but was not employed.

By the end of this year (1917) the following apparatus had been evolved for and by the R.F.C. and was in use in the field.

Short and medium range air to ground spark transmitter.
Aircraft receiver for Morse and telephony.
Aircraft and ground telephony and C.W. transmitter.
Ground spark, Tonic train, and C.W. transmitters and C.W. and spark receivers, and Directional receiving for aircraft was in an advanced experimental stage.

The total wireless personnel now numbered 306 officers and 3,760 operators and mechanics.

The figures for the month of September, 1918, which represented the full development of our last great offensive which resulted in the final defeat of the enemy.

2,120 Shoots to destruction.
2,575 Flash patrols.
74,201 Fleeting target calls from the patrol machines.
11 Wireless failures.

At the signing of the Armistice complete ground wireless communications had been established between all units. Between 400 and 500 machines were fitted with wireless, and the guns were provided with nearly 2,000 wireless stations.

The whole personnel amounted to 520 officers and 6,200 other ranks.

It must, I think, be judged satisfactory that we were able to beat the enemy so thoroughly in a science in which at the outbreak of war they excelled so conspicuously.

Of the truth of this assertion he has given us ample corroboration in a document captured by us, and of which I will give a translation in conclusion.

Translation of a German Document.

XI. Army Corps Staff.
South of the Somme.

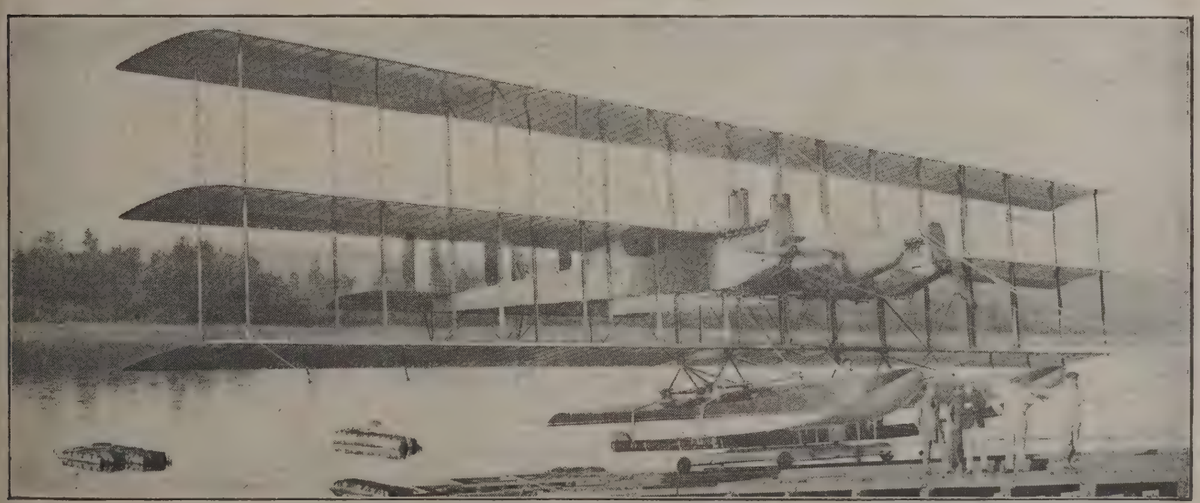
Ic/Wing Commander No. 12358/1466. Corps H.Q.
Relating to Salvage of Aeroplanes. 1-6-18.

"1. The salvage of aeroplanes must be pursued with still greater vigour. Valuable technical improvements, which have apparently been extensively applied by the enemy, have been lost to us hitherto. Labour and money spent at home on trials might have been saved by earlier information.

"2. The enemy has secured a distinct advantage in his successful use in aeroplanes of continuous wave wireless apparatus which possesses great superiority over the spark apparatus in use with us.

"It is of the greatest importance to us to salve further enemy wireless apparatus of this description. In this way millions of money will be saved, as we have not so far been successful in constructing a continuous wave wireless apparatus for aeroplanes, which can work without certain disadvantages.

"It is, therefore, the duty of all authorities to ensure the most indefatigable and careful salvage of wireless apparatus of enemy aeroplanes. Every particle is to be salved and collected, if it is in any way possible. The ordinary man cannot recognise what value and meaning a single piece can have to an expert. As, by unskilled removal, this very delicate apparatus can easily be destroyed, the work of salvage is to be entrusted to Flying Corps or wireless personnel.



"Having regard to the great importance of the apparatus for our own wireless telegraphy, the recovery and salvage premiums are correspondingly high. They belong to the formation which, by informing the Flying Corps, permits of assistance and appropriate measures being taken for salving the object undamaged; therefore, such premiums will not belong to the Flying Corps unit."

This brief history of the wireless work done by the Military wing of the Royal Air Force is a recital of small details, each so insignificant that one would hesitate to mention them individually. Remembering the conditions obtaining in war, the difficulties of supply and training, and the enormous importance of time, the general results achieved must be accepted as justification for the policy adopted.

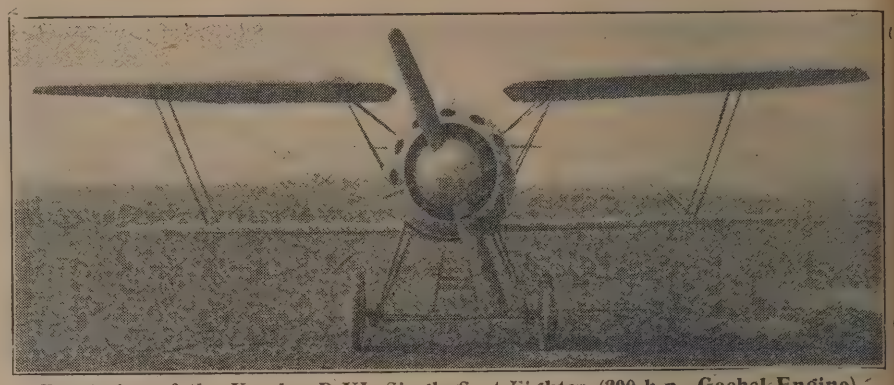
A NOVEL USE FOR SCRAPPED PARTS.

At a recent entertainment given by "The Whippets," the pierrot troupe of the Air Navigation and Enginnering Co. (Blériot's), at Addlestone, an entirely original "jazz" band was formed of members of the troupe playing upon "instruments" consisting of "scrapped" sheets of metal, motor-car parts, and aeroplane parts, and, according to reports, some weird and wonderful "music" was thus produced.

One would suggest that a rotary engine cowl would make a perfectly good gong, and doubtless the centre section of a wing having the fabric on it very taut, and tightly doped, would be useful as a drum, which could be beaten with the "joystick" or a centre section interplane strut with one end padded. In these days of economy, the concert parties of aircraft firms would do well to take the hint. But imagine the feelings of a pilot in the audience on seeing the component parts of his favourite 'bus thus used!—J. F. S.

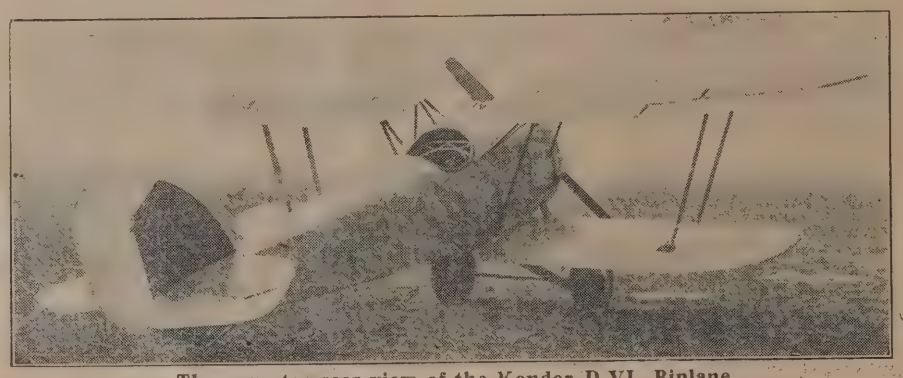
A three-engine Caproni Sea-Triplane.

RECENT GERMAN WAR MACHINES.



III.—Kondor Flugzeugwerke.

The Kondor Works at Gelsenkirchen-Rotthausen were founded by the pilot Joseph Suvelack before the war, and produced a number of experimental monoplanes and biplanes.



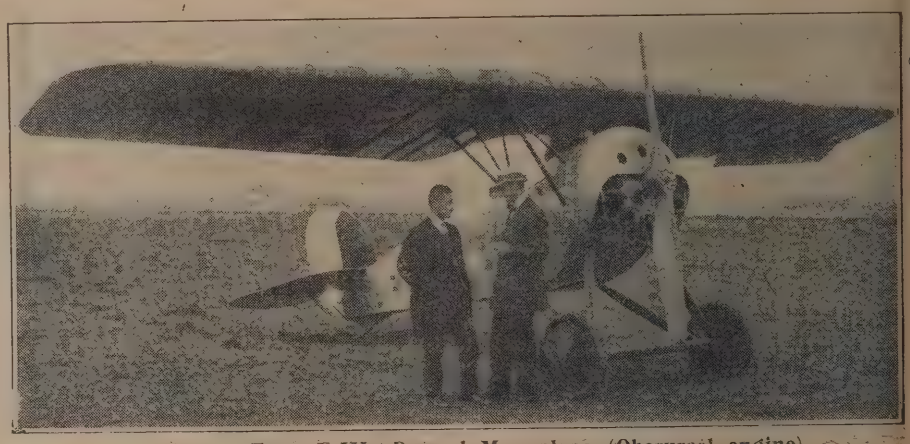
Suvelack himself was killed in aerial combat with a British opponent, but the concern has carried on in spite of the founder's death.

During the war the firm acquired the services of Herr Westphael as chief designer, under whose guidance they turned out a tractor biplane with a Mercédès engine which established a German altitude record with four passengers at Johannisthal.

More recently the Kondor works have turned out the machines illustrated here. The first, illustrated in the two upper photographs, the D.VI., is a single-seat fighter fitted with the 200 m.p. Goebel rotary engine—a German effort of very "Le Rhone"-ish aspect.

Front view of the Kondor D.VI. Single Seat Fighter (200 h.p. Goebel Engine).

Threequarter rear view of the Kondor D.VI. Biplane.



In this machine it would appear that the designer's wish to provide the pilot with the very best possible view has somewhat outrun his constructional discretion. At any rate, the angle of the struts between the fuselage and the upper planes does not inspire one with any great confidence as to their capacity to resist the compression loads usually carried by the centre section spars.

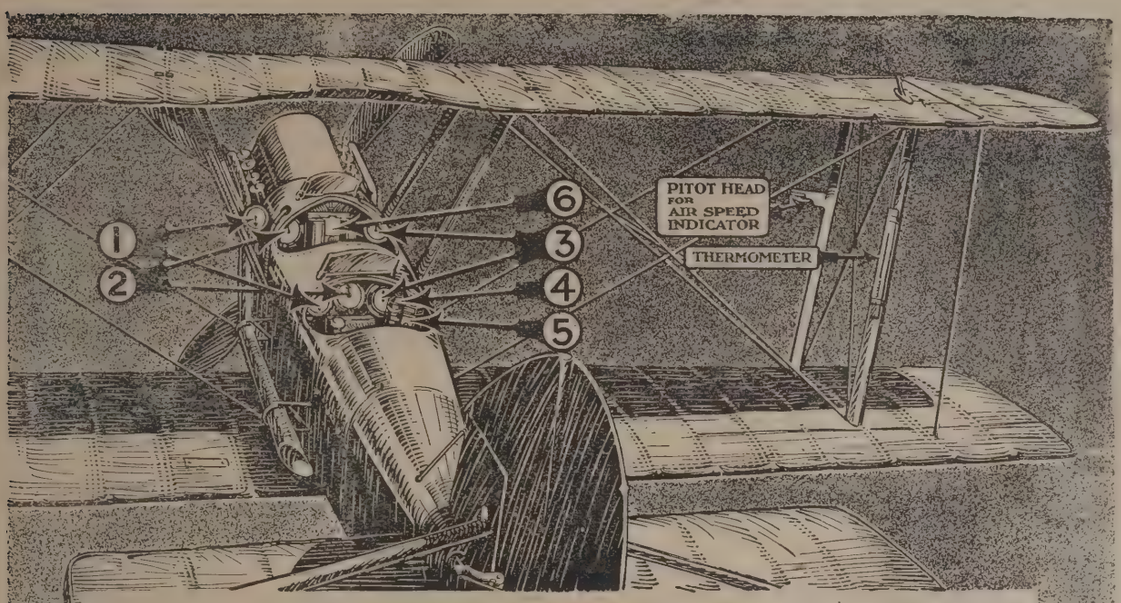
Apart from this extraordinary feature, the machine looks to be a very simple and straightforward example of its class, conforming in all respects to German standard practice.

The arrangement of cowling is curious; the row of air ducts fitted in the front are presumably intended to supply air to the cylinder heads for cooling purposes—which might as well have been affected by suitably shaping and proportioning the spinner attached to the air screw, and at a lower cost in head resistance.

The next two pictures represent machines which might as well have been built by any one of several of the German manufacturers.

They are of the Fokker inspired cantilever-wing parasol-monoplane type, which pictorial evidence suggests have been built to one design—with minor modifications—by most of the German constructors.

The Kondor Type E.III. Parasol Monoplane (Oberursel engine).



The Kondor Type E.IIIa. Parasol Monoplane (200 h.p. Goebel Engine).

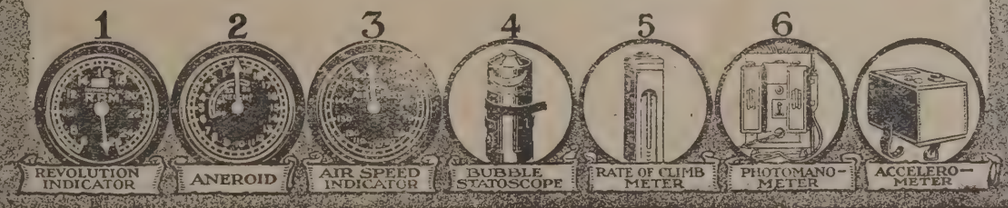
The upper picture—the Kondor E.III., is fitted with the Oberursel rotary of 140 h.p. and differs very little indeed from the original "Fokker" parasol.

It is obviously fitted with metal wings of the same general structure as its prototype, and its general arrangement is exactly the same. The machine is said to have a speed of 195 k.m.p.h. (121 m.p.h.), and a climb to 5,000 metres (16,400 ft.) in 16 mins.

The type E.IIIa. below is a modification, fitted with the 200 h.p. Goebel engine.

The curious cowling used with the same engine on the D.VI biplane is here again employed, the gap between the wing and the top of the fuselage appears to have been reduced, but in all other respects there seems little difference. With the more powerful engine the speed is said to have increased slightly—to 200 k.p.h. (124 m.p.h.), and the climb to 5,000 metres occupied only 11 mins.

AIRCRAFT IN THE MAKING—No. 4



Being one of a series of announcements which describe and illustrate interesting Scientific Devices, Instruments and Machinery utilised in the designing and making of B. & P. Aircraft.

FULL SCALE TESTS

IN order that calculations based on model results may be verified and "scale-effect" experience co-ordinated, careful tests are made with complete aeroplanes. The illustration shows our P9 model fitted up for full scale experiments. Numerous special instruments are utilised to indicate and to record the desired information. For the majority of these instruments, some of which are illustrated, we are indebted to the work of the Royal Aircraft Establishment and the Martlesham Heath Testing Station.

Boulton & Paul Ltd.
NORWICH

NAVIGATION INSTRUMENTS.

The following memorandum has been issued by the Controller of Information, Dept. of Civil Aviation :—

Technical Memo. No. 5, Nov., 1919 :—From time to time various aviation firms have made inquiries at the Air Ministry as to the supply, for civil aviation purposes, of navigation instruments of the types which have been used by the Royal Air Force.

The following brief descriptions of some of the apparatus, together with the names of firms who have supplied the apparatus to the Air Ministry, are given so that intending users can apply direct to the manufacturers.—(Signed) E. D. SWINTON, Controller of Information.

Aero compasses of various types according to the designs of Capt. Creagh-Osborne, R.N., and Messrs. Hughes and Son, Ltd., can be supplied by Messrs. Hughes and Son, 59, Fenchurch Street, London, E.C.3, who now hold the sole patent rights. The types include airship compasses, seaplane compasses, and compasses for long-distance machines.

The Bigsworth Chart Board.—This consists of a board with a celluloid cover under which a chart can be placed. A double parallel-link arm is pivoted to a clamp which can be adjusted up and down the left-hand side of the board. The free-end of the arm carries a clamping device to which is pivoted a rectangular celluloid protractor and a bearing pointer working over a celluloid bearing disc fixed at the centre of the protractor. Both the pointer and the protractor can be clamped in any position in the clamping device. The latter can, by reason of the construction of the arm, be moved over the board by parallel movement to any position without rotation. A 17-in. board has been manufactured by Messrs. J. A. Sinclair and Co., Ltd., 54, Haymarket, S.W., and a 14-in. board by Messrs. Bleriot, Ltd., 57-9, Long Acre, W., and the General Instrument and Engineering Co., Adam Street, New Kent Road, S.E.

Campbell-Harrison Course and Distance Calculator, combined with the Appleyard Time and Distance Dials. This instrument was designed for solving problems involving the speed of the wind and the air-speed and ground-speed of the aircraft. It enables, for example, the steering-course to be found when the wind and the course to be made good are known. It consists of two celluloid discs of about 8 inches in diameter pivoted together and provided with two arms pivoted at their centre. The arms are marked with scales of speeds and have index slides adjustable along them. The upper disc is transparent and ruled into squares by parallel lines at the same intervals as the markings of the speed scales on the arms. The lower disc is marked with compass bearings and degrees, and the edges are marked with logarithm scales for finding the distance covered in a given time or the time required to cover a given distance. The Course and Distance Calculator has been manufactured by the following firms :—

Metal, 9-in.—The Endacott Scientific Instrument Co., Verulam Street, E.C.1, and The General Instrument and Engineering Co., Adam Street, New Kent Road, S.E.

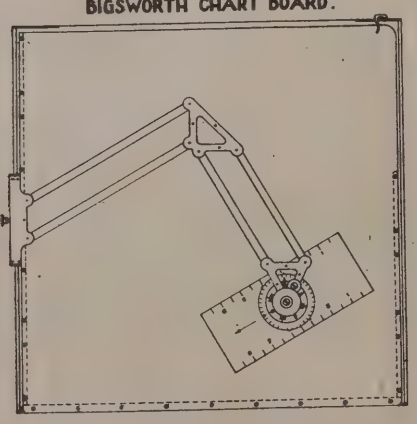
Metal, 7-in.—Messrs. Elliott Bros., 1, Central Buildings, Westminster, S.W.1.

Celluloid, 7-in.—Messrs. Hughes Label Co., Ltd., Titchfield Works, Enfield, Middlesex, and The Celluloid Printers, Ltd., 17, Hanway Street, Oxford Street, W.

Six-inch Drift Bearing Plate.—This consists of a circular frame which can be fixed horizontally outside the fuselage. The bearing plate, marked with compass bearings and in degrees, is a ring which can be rotated in the frame. Another ring is arranged externally on the frame and can also be rotated on the frame. The latter ring carries two celluloid strips close together, arranged so that the joint between them is diametral to the rings, and a sight bar hinged at one end of the strips. When the inner ring is set according to the steering course and the outer ring turned so that objects on the ground appear to move parallel to the strips, the drift can be read by means of the graduations and index provided. With the sight bar in the vertical position, the instrument can be used for taking bearings and measuring the angle subtended by two distant objects. The sight bar has an altitude scale by means of which a back sight can be adjusted on it so that the line through it and a foresight fixed on the front of the outer ring meets the ground a known distance, say half a mile, in front of the aircraft. The instrument can thus be used with a stop watch for finding the ground speed. The instrument has been manufactured by Messrs. Heath and Co., Ltd., New Eltham, S.E., and Messrs. Casella and Co., 49-50, Parliament Street, S.W.1.

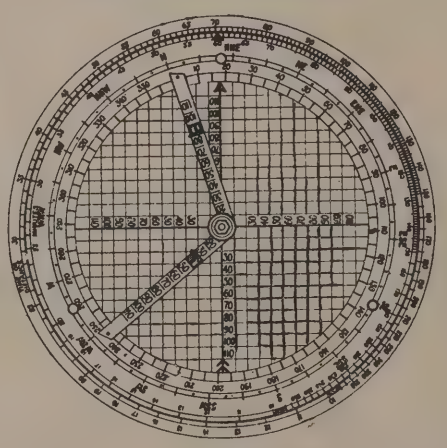
Appleyard Air-speed Computer for correcting indicated air-speed for altitude.—This consists of a circular disc marked at the edge with a logarithmic scale of air-speeds and rotatable on a card marked with a scale of heights. The latter scale has a red arrow. The true air-speed is read against this arrow when the indicated air-speed on the disc is put against the height on the card. The instrument has been manufactured by The London Name Plate Co., 127, Elthorne Road, Upper Holloway, N.19.

AIRCRAFT FINANCE.



Sidelights on the efforts of one Robert Taylor some time ago to become a power in the Aircraft Industry were disclosed recently when two bankrupts—William Fredk. King, of 3, Vauxhall Bridge Road, S.E., and Edward Charles Gillott, of 38a, Bessborough Street, Pimlico, S.W.—applied for their discharge from bankruptcy.

Mr. King was a Director of William King and Son, Ltd., builders and contractors, and also of four aircraft companies, three of which went into liquidation, and to all of which he was introduced by Robert Taylor. He attributed his failure to liability as surety for money lent to Taylor and to one of the aircraft companies. Taylor had stated that he could picture contracts from the Air Board for aeroplane parts and could finance William King and Son, Ltd., to which the bankrupt and his brother had sold their business, and of which Taylor was appointed Managing Director. On behalf of Mr. King, who is 66 years of age, it was advanced that his was a very old business, and that he had no liabilities except those incurred through Taylor. He was granted his discharge on consenting to judgment for £100.



In the case of Mr. Gillott, he was the Manager of the Draycott Engineering Co., Ltd., who made aeroplane parts. In March, 1918, he bought the plant of the Draycott Company, and in June he retired from partnership in that concern. His bankruptcy was due to a promissory note which he had signed in September or October, 1918, together with Mr. Nathan, the Secretary of the Draycott Company and Mr. King. The cheque received from the lenders of the money was handed to Taylor, who started the company and was its Chairman. He understood that the money was to be used for the benefit of the company; but, as a matter of fact, the company received none. Mr. Gillott also received his discharge on consenting to judgment for £53.

It will be recalled that Taylor was also concerned in the Cowper-Coles aircraft affair.

LONDON.

HOUNSLOW.—On Dec. 4th, an Airco D.H.9 biplane piloted by Lt. Powell left the aerodrome at 12,10 p.m. for Brussels, with one passenger (the Secretary of the Aero Club of America) and a pilot to be dropped at Lympne. After calling at Lympne the machine proceeded to Wimereux to deliver spare parts required for an Airco machine which had a forced landing there. Wimereux was reached at 1.30 p.m., and the journey to Brussels was completed 35 minutes later.

An Army officer chartered an Avro machine at the Lepaerial Travel Bureau to fly from Hounslow to Farnborough on Nov. 24th with a special supply of ammunition urgently required. On his arrival at the aerodrome the machine was awaiting him.

Before the Carpentier-Beckett fight took place it was arranged that as soon as the result was telephoned to Hounslow an Avro biplane should fly over London firing coloured lights to indicate the name of the victor—red for Beckett and green for Carpentier. This programme was successfully carried out. Luckily the night was clear, though the wind was strong.

The Avro, piloted by Major A. G. Taylor, A.F.C., the Avro London manager, had a hard fight against the wind on the journey back, but, despite these conditions, a perfect landing was made. The flight lasted about three-quarters of an hour, and practically the whole of London was covered. A representative of the "Evening News" had a seat in the machine.

CANADA.

"Automotive Industries" of Nov. 9th states that Handley Page, Ltd., have secured a Dominion charter to engage in a general aeroplane business in Canada. The capital stock will be $2,500,000. The head offices will be at Morrisburg, Ont. The directors are William Harold and Admiral Mark Kerr, London, England; Harry Clark, Montreal; Fred Chalmers and W. H. Gannon, Morrisburg.

INDIA.

An aerial mail service is to be started between Bombay and Karachi on Jan. 1st. When the service starts letters from Karachi to Great Britain will catch the mail boat at Bombay if posted twenty-four hours later than usual.

SOUTH AFRICA.

The South African correspondent of THE AEROPLANE writes:

"KING OF THE AIR."

The B.E.2e biplane which flew from Johannesburg to Banana Siding and back, piloted by Lieut. A. H. Gearing (ex-R.A.F.), has been flown to Pretoria for dismantling and subsequent storing in Cape Town. Lieut. Gearing is finished with flying for exhibition purposes, and henceforth will devote himself to his engineering business in Cape Town.

S.A.A.T. LTD.

South African Aerial Transports, Ltd., are the sole agents in South Africa for A. V. Roe and Co., Ltd.

The first passenger flight was made at Johannesburg by Capt. Ross, D.F.C., who took up the mayor of the town, Mr. T. A. Allen, after the machine (an Avro biplane, 110-h.p. Le Rhone engine) had been duly christened "The Rand Queen."

After the flight Capt. Ross made a pretty speech to the vast assemblage, assuring them of the joys of "flipping," etc., and the splendid prospects in front of the company in spite of the uphill work they would have to do at the start.

Col. Armes responded fittingly.

The comedy "Going Up" was produced at the theatre at the same time as the first flight was made, and the coincidence of production provided a grand opportunity for mutual back-scratching for the theatre management and the aviation company with mutual benefit.

One machine is now in commission under the pilotage of Capt. Ross. There is a steady stream of passengers of both sexes, who are charged a minimum of £5 for twenty minutes' flight. The public are in need of a great deal of aviation education, but they want it none too expensively.

Two three-seater Avros have been received at the aerodrome and are in course of construction. It is also on the "tapis" to bring out from England a Vickers all-steel "Vimy," possibly under its own power.

THE HANDLEY PAGE AGENT.

Capt. S. Wood is reported to have said that his firm will have machines in Johannesburg for the season, which begins normally on Nov. 1st.

ANOTHER FIRM.

Two men by the name of Robinson possess two aeroplanes, which they are going to use for passenger carrying.

MUIZENBERG.

One of the two latter concerns intends to give trips at Muizenberg during the months of Dec., Jan. and Feb., when the resort is crammed with the wealth and gout of the "Golden City."

The S.A.A.T., Ltd., are also considering the advisability of making a little money at Muizenberg during the season. Unfortunately for all, there do not appear to be any fields suitable for flying-grounds.—H. G.

SOUTH AFRICA.—THE FIRST LOOP.

Several passengers were taken up at the Baragwanath aerodrome (Johannesburg) on Nov. 2nd, although the weather was not good. Late in the afternoon Col. Armes, C.M.G., the managing director of Aerial Transports, Ltd., was taken for a flight by Capt. Rutherfoord on an Avro machine and was looped. The Johannesburg "Star" claims this to be the first loop to have been made in South Africa.

THE CAPE TO CAIRO FLIGHT.

Major Court-Treatt, surveying aerodromes for the Cape to Cairo flight, left Johannesburg some time ago on a Buick car to establish an aerodrome near Lake Tanganyika. Major Court-Treatt left the car at the aerodrome for their use and was expected back in Johannesburg in the last week of November.

LIEUT. A. H. GEARING.

CAPT. ROSS, D.F.C.

BRAZIL.

Congress has approved of the Handley Page mail contract for a service from Pernambuco to Buenos Aires, a distance of 2,500 miles, which is to be covered in 3½ days in a weekly service. At present the ordinary mail-boats take nine or ten days on the route. Other services approved are Rio Janeiro-Sao Paulo, and Sao Paulo-Santos.

According to the "Times" of Dec. 4th, the Handley Page Company have sent, or are sending, out to Brazil twenty-four machines, which, besides carrying the mails, will inaugurate passenger and freight services. The machines are of the two-engine type, with a carrying capacity of 2,500 lb.

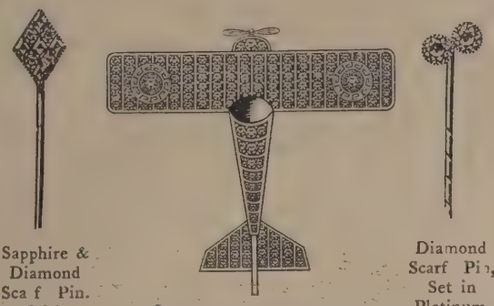
DENMARK.

The Danish correspondent of THE AEROPLANE writes:—

THE FATE OF THE "GOLIATH."

The long-announced Lieut.-Col. Henderson has finally arrived at Copenhagen on an Armstrong-Whitworth biplane, after a forced intermediate landing owing to a prevailing snowstorm at Hamburg. There he met the Danish-French Lieut. Krause-Jensen, the pilot of the ill-fated Farman-Salmson-engined "Goliath," which, after a long involuntary stay in Denmark owing to engine breakdown on the return flight to France, had had to land in Holstein owing to fog, and was held up for lack of petrol till a French cruiser brought the precious fluid. The "Goliath" came to grief finally in a marsh near the Dutch frontier. The pilot, M. d'Ors, deceived by the snow, though he had a suitable landing-ground before him, but the landing was disastrous.

AN "ALBATROS" FOR BUSINESS USE.



The Sleswig pilot Schmidt has sold his Albatros biplane for 10,000 kr. (£550) to a provincial automobile dealer, who has erected a shed in his native city, Herning, in Jylland, and has engaged another German aviator, Hecken, as pilot, as he intends to employ the aircraft for business trips to Copenhagen.

IS EXCHANGE ROBBERY?

The Grahame-White pilot, Capt. Chamberlain, has arrived at Copenhagen, with Mr. Hobday as passenger, in an Avro biplane. Mr. Hobday is a director of the Dominion Belting Co. He negotiated his first business after an intermediate landing at Brussels. The next stage ended at the Soesterberg Aerodrome, in Holland, the usual stopping-place en route to Scandinavia.

Finally, a forced landing was made by Bremen, where the reception by the inhabitants was none too kind till the stores and tobacco on board the machine were distributed, when they succeeded in acquiring a 260 h.p. Rumpler and set off for the Danish capital before the local authorities turned up to arrest them.

After local business with the branch in Copenhagen the pilot and passenger may continue to Stockholm or may return to England by air.—HI.

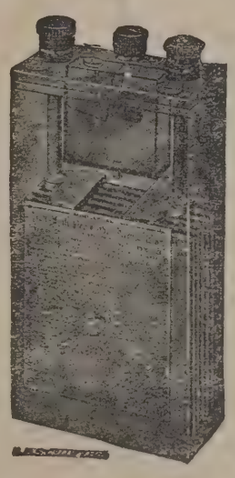
Christmas Presents

OF HIGHEST QUALITY

THE Goldsmiths & Silversmiths Company's Christmas Presents are of highest quality, and at the moderate prices offered represent the best value obtainable.

A catalogue of Christmas Presents sent post free on application.



THE GOLDSMITHS & SILVERSMITHS COMPANY LTD. with which is incorporated The Goldsmiths Alliance Ltd. Est. 1751

112, REGENT STREET, LONDON, W.1.

"Exide" EXCELLENCE.

In accumulator manufacture, more than in most things, quality of materials and the correct treatment of these materials is of supreme importance.

Years of research, the careful designing of each type for the work it is intended to do, critical selection of all materials and careful workmanship with modern appliances, all form the basis of our manufacture of

Accumulators of Quality.

220, SHAFTESBURY AVENUE, W.C.2,

is the address at which you may examine these accumulators.

THE Chloride ELECTRICAL STORAGE COMPANY LIMITED.

Head Office and Works CLIFTON JUNCTION MANCHESTER.

London Office 39 VICTORIA STREET S.W.1.

FINLAND.

A Reuter message from Helsingfors, dated Dec. 4th, stated that M. Frenckel, the president of the Finnish Aero Club, had informed the "Ussi Suomi" that he intended to establish an aerial mail service between Stockholm and Helsingfors, and that he was also planning a regular service with Reval and Petrograd, and possibly Berlin and London.

FRANCE.

Landing Grounds.

At Perpignan there is a landing-ground without shed accommodation, and at Canet-plage a landing-ground with accommodation for aircraft.

The landing-grounds at Sarreguemines, Schlestadt, Neu-Brisach and Amiens have been abolished. That at Issoudun has been replaced by one at Romorantin, where there are buildings and fuel.

The Paris-Melbourne Flight.

M. Poulet, on his Caudron biplane (two 110-h.p. Le Rhone engines) reached Akyab on Nov. 28th, and arrived at Rangoon at 12.45 p.m. on Nov. 30th. He landed forty-five minutes after the Vickers "Vimy." M. Poulet arranged with Capt. Ross Smith that they would both leave Rangoon for Bangkok at 7.0 a.m. on Dec. 1st.

Apparently the arrangement was adhered to, as Reuter messages stated that he left Rangoon at that time, and arrived at Bangkok on the same day just before Capt. Ross Smith. There M. Poulet handed over to the Minister of War the documents which were entrusted him by the chief of the Siamese mission in Paris. He left Bangkok on Dec. 2nd for Singapore, intending to alight for supplies on the eastern coast of the Malay Peninsula, about 400 miles away.

A Reuter message states that if M. Poulet arrives at Melbourne he will give a series of exhibitions in Adelaide, Sydney and Melbourne, and then fly over Borneo and up the Chinese coast to Japan, whence he will return to India and to France by the original route.

Thus he may cover his expenses, and also aid the widow and children of Vedrines, who was killed on an Alpine flight.

The Salon de l'Aeronautique

The President of the French Republic received last week a delegation from the Executive Committee of the French Aero Show. The Committee was composed of MM. Leblanc, President; Louis Bréguet and Luquet de Saint-Germain, Vice-Presidents; and M. André Granet, Commissaire-General.

After having discussed for a considerable time with the delegation questions concerning the future of France and the aeronautical industries, M. Raymond Poincaré kindly consented to open the Exhibition on Friday, December 19th, at 10 a.m.

A Marseilles-Tunis Service.

A correspondent writes :—

The Aeronovale Company have nearly completed their machine for a service between Marseilles and Tunis, to begin in February, 1920. This machine has one Salmson and two 120-h.p. Le Rhone engines, but otherwise is of typical French design. It will carry ten passengers besides freight, in all nearly a ton.—J. S.

A New Prize.

At a general meeting of the Aero Club de France, M. Soreau stated a new prize of 100,000 francs (normally £4,000) has been offered, the details of which will shortly be announced.

A Removal of the Breguet Office.

The head office of the Breguet firm has been moved from 17 rue du Colonel-Moll to 115 rue de la Pompe, in Paris.

ITALY.

The Italian correspondent of The Aeroplane writes :—

Aviators' Trade Unions.

The Roman section of the Aviators' "Trade Union" was formed the other day and numbers 500 members, who are nearly all pilots. The director is Col. Piccio, and Col. La Polla is second in command. The Milan section was to be formed on the 7th inst.

The Italian Atlantic Flight.

Reports from Turin show great preparations for great things. The Italian crossing of the Atlantic is said to be awaiting D'Annunzio. One wonders which of the two biggest aeroplane firms will be ready first. It is curious that no one seems to have thought of quoting a real aquatic flying machine as the vehicle most adapted for the flight.

New Machines.

I am waiting news from Signor Ricci, at Naples, whose big seaplane designs are taking form and should soon get moving over the face of the waters. A very big machine is in the building at Bastianelli's works, so that the South is still alive. A 300 h.p. H.-Suisa-engined machine is reported to be preparing to take the air at Palermo. Built at the Ducrot shops, the biplane has a steel strut at the extreme ends of the cellule. Speed would seem its prime object.

Five different types of small aeroplanes, of about 30 to 40 h.p., are at present existing in this country.

For Avietes.

One Zoboli, of Bologna, invites investigations by the competent into his means of transmitting leg-force to airscrews, which he believes will render the aerial bicycle possible. The secret evidently lies in the light weight of the gearing-down mechanism in this case.—T. S. H.

SWITZERLAND.

The Italian correspondent of The Aeroplane writes :—

A French-Swiss Conference.

A French-Swiss conference, on the lines of the Anglo-Swiss one held a few days ago, took place last week at Berne, and an agreement was drawn up as to flights over each other's territory and permits to fly. Col. Borel, Maj. Issler, Prof. Pittard, and Col. Loriol represented the Confederation; Capitaine Roper and M. De Lens the French Republic. M. De Lens is a secretary to the French Embassy. Switzerland signed at once; France referred the matter to H.Q.

An Aero Trade Centre.

It seems that Locarno is going to become one of the great jumping-off grounds for the northern aero trade towards the Mediterranean countries.—T. S. H.

THE HANDLEY PAGE W.8.

After lengthy experiment the firm of Handley Page, Ltd., assisted by the experience gained in the production of bombing machines, have built a large commercial machine capable of carrying 15 to 20 passengers or heavy loads of cargo up to two tons.

The machine is designed so as to provide a single large saloon 22 ft. long, 4 ft. 6 in. wide and 6 ft. high. This is unique in the history of aeroplane construction. The space provided is entirely unobstructed by wires or cross struts, and when used for carrying cargo entirely, 470 cubic feet of space is available. The seats for the pilot and engineer are in a well protected cockpit immediately forward of the saloon.

Port hole windows, which can be opened or shut, are provided along each side of the passenger cabin, one for each occupant. In the floor, lenses are fitted in order to provide a direct view downwards.

The interior of the saloon is fitted with velvet cushioned arm-chairs with receptacles for maps, carpets, curtains, electric light, lamps, clocks, mirrors, wireless apparatus, a telephone, flower vases, books and papers. A lavatory is also provided.

When carrying large consignments of cargo, light racks, shelves and cupboards can be fitted on either side of the cabin, leaving a central gangway. Large doors are fitted in the side of the machine and there is a trapdoor in the floor to facilitate the entry and removal of freight. A door also communicates between the passenger saloon and the pilot's cockpit.

The engines are provided with effective silencers to enable conversation to be carried on amongst the passengers.

The large reserve of engine power possessed by the machine enables it to ascend with full loads out of very small fields, and this extra power can also be utilised when flying in strong head winds. The aeroplane can be flown entirely on one engine should the other fail.

The machine, with the exceptions of the steel undercarriage and the engine nacelles, is entirely painted white. In the air it has a very pleasing appearance, and flies very steadily. The striking feature when seen on the ground is the immense balanced rudder and the large fin. A monoplane tail plane is fitted.

After only one test flight of 20 minutes the machine was flown by Mr. Bager from Hounslow to Le Bourget in 2 hours 10 minutes on Dec. 4th for exhibition at the Salon de L'Aeronautique (Paris) whence it is to be transported by road.

Specification.

Type of machine	Twin-engine biplane.
Name and type No. of machine	Handley Page W.8.
Purpose for which intended	Commercial
Span	75 ft.
Overall length	60 ft.
Maximum height	17 ft.
Maximum width with wings folded	29 ft.
Engines, type and h.p.	Two 450-h.p. Napier "Lion."
Tank capacity	Petrol 250 galls.; oil, 37.5 galls.
Carrying capacity	15-20 passengers or 2 tons freight.
Performance—	
Speed (maximum)	112 m.p.h.
Normal cruising speed	90 m.p.h.
Landing speed	45 m.p.h.
Duration of flight	6½ hours

AIRCRAFT IN PARLIAMENT

HOUSE OF COMMONS.

Dec. 1st.—The following oral answer was given :—

AIRCRAFT SUPPLIES.

Lieut.-Col. Sir F. HALL asked the President of the Board of Trade if he had had his attention drawn to the great efforts which are being made by American trading interests, with the United States Government's co-operation, to develop the South American markets for aircraft supplies and aircraft transport undertakings; and if he will state what is being done by the British Government in the same direction with a view to stimulating this important industry in this country.

Sir A. GEDDES: The answer to the first part of the question is in the affirmative; as regards the second part of the question, several important British aircraft firms already have their representatives in a number of the South American Republics, and His Majesty's diplomatic and commercial representatives in those countries are assisting, and will continue to assist, them as far as lies in their power. British firms in this country are being kept in touch with developments, information concerning which is unlikely to reach them through their local representatives.

The following written answer was given :—

ANTI-AIRCRAFT STATION, PUTNEY HEATH.

Mr. LORDEN asked the Secretary of State for War why the anti-aircraft station at Putney Heath on and adjoining the Metropolitan Water Board's reservoir is still continued, seeing that the urgent need has ceased to exist for over twelve months, in view of the danger to the health of the Metropolis caused by the very dirty and unsatisfactory state of the station.

Mr. FORSTER: It is proposed to maintain these headquarters, though not necessarily on the present site, as part of the permanent scheme of anti-aircraft training. Until a new permanent site has been acquired no other accommodation is available for the personnel, stores and equipment.

* * *

Dec 2nd.—The following oral answers were given :—

ROYAL AIR FORCE (BOULOGNE DEPOT).

Capt. GUEST (Joint Parliamentary Secretary to the Treasury), replying to Captain Terrell, said that the mechanical transport at the port depot of the R.A.F. at Boulogne consists of one touring car and one light tender. The staff consists of one officer and four airmen. The depot is being kept open to deal with the drafts of airmen arriving from England daily and with the evacuation of airmen from France.

CIVILIAN AIR SERVICE (PARIS-LONDON).

Lieut.-Col. GUINNESS asked the Secretary of State for War whether there are at present any facilities for the repair of British aeroplanes or the supply of spare parts in connection with the daily Paris-London air service at any aerodrome in France except the terminus at Le Bourget, and whether it is not a matter for the British authorities. Is the hon. gentleman aware that there are now three different British types of machine flying this route of 130 miles over French ground, and is it not obviously impossible for these companies to provide the necessary facilities for small adjustments before crossing the Channel.

Capt. GUEST: I have been asked to take this question, the reply to which is in the negative. Certain emergency landing-grounds exist between Gris Nez and Le Bourget. The importance of establishing a civil aerodrome with full facilities in the vicinity of Gris Nez is known to the French authorities, and it is understood that they intend to provide such an aerodrome. The question of whether it is a matter for the British authorities is complicated by the fact that we are dealing with a civilian service and not a military service, but the department is in communication with the French authorities on the subject.

ROYAL AIR FORCE.

Mr. CHURCHILL, replying to Major Steel and Earl Winterton, said that he proposed at an early date to lay before the House a Memorandum by the Chief of the Air Staff showing the proposed strength and composition of the R.A.F. for the next few years.

Replying to Mr. Pemberton-Billing, he said that opportunities for debate were fixed in the regular course of the Parliamentary Session and did not arise in consequence of any announcement of this kind.

WIRELESS COMMUNICATION (LONDON AND PARIS).

Lieut.-Col. GUINNESS asked the Secretary of State for War whether, owing to the interruptions caused by the Eiffel Tower wireless station last week, when messages sent in connection with the London-Paris air-mail service were regularly jammed by the Eiffel Tower, the air-mail messages can be received by the wireless station at Le Bourget; and whether any arrangement has been made with the Eiffel Tower Company.

Capt. GUEST: I have been asked to reply to this question. Routine times of transmission from London to Le Bourget have been arranged so as to avoid the interference referred to by my hon. and gallant friend. In cases when it is doubtful if the message has been received by Le Bourget, a second message is always sent; during the last week these messages have been received regularly, and no repetition has been required. Air route reports of the British and Channel weather conditions are sent from London to Le Bourget between 8 a.m. and 5 p.m. An arrangement for a special allowance of time has been made in regard to the Eiffel Tower station.

AIRSHIPS (BERLIN AND FRIEDRICHSHAVEN).

Col. NEWMAN asked the Secretary of State for War whether a service of dirigible airships is being maintained between Berlin and Friedrichshaven; how many airships are so employed; and will he say whether the establishment and maintenance of a fleet of airships in Germany, whether by the State or private individuals, was a matter laid down in the Peace Treaty.

Capt. GUEST: I have been asked to reply to this. The answer to the first part of my hon. and gallant friend's question is in the affirmative; to the second part, that, so far as is known, only one airship—the "Bodensee"—has been so employed. As regards the third part, I would suggest that the question should be addressed to my hon. friend the Under-Secretary of State for Foreign Affairs.

The following written answer was given :—

ROYAL AIR FORCE CIVILIANS (DISCHARGE).

Capt. GUEST, replying to Mr. A. Davies (Clitheroe), said: Telegraphic instructions to suspend the demobilisation of civilian subordinates until further orders were sent to Royal Air Force depots on Nov. 15th, and the receipt of these instructions has been acknowledged by Ascot and the other depots concerned.

* * *

Dec. 3rd.—The following oral answer was given :—

LONDON-PARIS AIR-MAIL SERVICE.

Lieut.-Col. GUINNESS asked the Postmaster-General whether instructions have been given at the post office in Parliament Street that letters for the London-Paris air-mail service are only to be accepted for posting in the morning; what is the reason for preventing the posting of such correspondence daily at the end of business hours; and whether he will now arrange for its acceptance at any time of the day at the eight post offices mentioned in the original announcement.

The ASSISTANT POSTMASTER-GENERAL (Mr. Pease): No instructions have been given for the refusal of aeroplane letters tendered at the Parliament Street branch office in the evening for dispatch by the air-mail service to Paris on the following day; and steps have been taken to prevent the refusal of such letters at any of the eight London offices at which correspondence may be posted for transmission by the air-mail service.

The following written answer was given :—

ROYAL AIR FORCE (KENLEY COMMON).

Sir ALBION RICHARDSON asked the Secretary of State for War whether the military authorities are still in possession of Kenley Common, which was taken over during the war for military purposes; if so, when is it proposed to vacate the common and to restore to the public their right to the full use of the same, and what is the reason for the delay in so doing.

Mr. CHURCHILL: The answer to the first part of this question is in the affirmative; and to the second and third parts, that, owing to the importance of this aerodrome both from a Service and civil point of view, it is desired to retain it as a permanent station. Negotiations are in progress with this end in view.

* * *

Dec. 4th.—The following written answers were given :—

AERIAL ROUTE, EGYPT AND THE EAST.

Lieut.-Col. MALONE asked the Secretary of State for War whether it is intended that the aerial route to Egypt and the East should pass *via* Malta.

Mr. CHURCHILL: No decision has yet been arrived at in regard to this.

AIR MINISTRY (STAFF).

Lieut.-Comdr. KENWORTHY asked the Secretary of State for War what is the present staff of the Air Ministry; and how many of these are employed in connection with civil, naval, and military aviation, respectively.

Mr. CHURCHILL: The staff of the Air Ministry at the end of November last numbered 2,539. This figure includes the staff recently taken over from other Departments in connection with the transfer of airship work and of the Meteorological Department to the Air Ministry—namely, 136 and 130 respectively. I am unable to supply the statement asked for by the hon. and gallant gentleman in the second part of his question, as it is impracticable to separate the staff into groups employed respectively in connection with civil, naval, and military aviation.

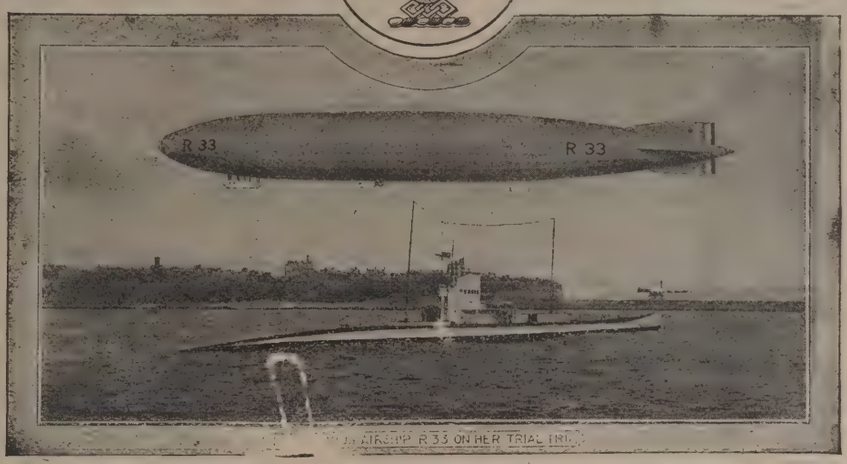
ROYAL AIR FORCE OFFICERS.

Sir BERTRAM FALLE asked the Secretary to the Admiralty what gratuity or pension is given to petty officers promoted warrant officers after eight years' service and automatically promoted to second lieutenants, Royal Air Force, on amalgamation of the Royal Naval Air Service and Royal Air Force; and if such officers, demobilised at their own request and in receipt of the permanent officer's gratuity, receive the difference between that gratuity and the gratuity given a temporary officer.

Mr. CHURCHILL: The whole question of the gratuities or pensions to be paid to Royal Air Force officers (temporary and permanent) who when commissioned in the Air Force were serving as warrant officers, Royal Navy, or Royal Naval Air Service, has been under consideration for some time, and it is anticipated that a final decision will be announced shortly.

THE FLIGHT TO AUSTRALIA COMPETITION.

The Air Ministry announced on Dec 3rd that the Netherlands authorities had provided new landing grounds in the Dutch East Indies which will be of great assistance



The location and distance of the aerodromes from Rangoon are as follows :—

Miles from Rangoon.	
427	Bangkok (Siam).
1,246	Singapore (Fed. Malay States).
1,529	Banka (Banka Island).
1,798	Batavia (Java).
1,863	Kalidjah (Kalidjati, Java).
2,054	Samarang (Java).
2,215	Surabaya (Java).
—	Bali (Bali Island).
—	Lombok (Lombok Island).
2,653	Bima (Soembawa).
2,775	Reo (Flores Island).
2,948	Larantuka (Flores Island).
3,098	Atamboea (Timor Island).
3,560	Port Darwin (Australia).

The Dutch authorities hoped to complete the arrangements in these islands by the end of November. The provision of these landing places will enable the flight from Java to Port Darwin to be made in easier stages than was originally contemplated.

A Dutch official is being sent to Singapore by the Government of the Dutch East Indies to give all detailed information.

TRADE MARK

AIRSHIP R 33 ON HER TRIAL TRIP.

— RIGID AIRSHIPS FOR WAR, MAIL & PASSENGER SERVICE. —

SIR W. G. ARMSTRONG, WHITWORTH & CO., Ltd.,

NEWCASTLE-UPON-TYNE. **Works: Barlow, near Selby, Yorks**

LONDON OFFICE: 8, GREAT GEORGE ST., WESTMINSTER, S.W.1.

TELEGRAMS: "ZIGZAG PARL, LONDON." TELEPHONE: VICTORIA 4010.

Round the world by Air

is mainly a question of organisation and *choice of flying stock.* As to the second factor, the B.A.T. Company can be of unusual assistance.

For instance, we are the first people out with a purely commercial model (not a modified war type)—the B.A.T., F.K.26—the machine with the largest cargo space and load capacity for its overall size and power yet produced.

Here are some interesting points concerning F.K.26:—

ENGINE:—Rolls-Royce Eagle VIII.

SPEED:—45-120 m.p.h.

CABIN:—Is clear of any transverse cross bracings or other obstruction, and measures 8 ft. by 3 ft. 3 ins. by 6 ft.—this in a machine of only 33 ft. overall length. Direct entry off ground through ordinary door.

LOAD:—With 600 mile range of fuel—2,000 lbs.

FUEL COST AT FULL LOAD: 7½ pence per mile.

CHASSIS:—A sturdy job, sprung by an unique combination of oleo and rubber shock absorbers.

TAIL:—Can be trimmed in flight from pilot's seat—steering and practically unbreakable tail skid.

GENERAL CONSTRUCTION:—Straightforward—simple to repair and recondition.

A series of these machines is in production. Governments and prospective owners desiring a fleet of these machines—or a single one—are invited to forward their enquiries.

Complete particulars on application to:—

The
BRITISH AERIAL TRANSPORT CO. LTD.
38, CONDUIT STREET, LONDON W.1.

The Australian authorities have also intimated that they have organised a route from Port Darwin to Melbourne :—

Miles from Port Darwin.	
—	Port Darwin (N. Territory).
170	Katherine (N. Territory).
405	Newcastle Waters (N. Territory).
530	Anthony Lagoon (N. Territory).
730	Avon Downs (N. Territory).
915	Cloncurry (Queensland).
1,230	Longreach (Queensland).
1,473	Charleville (Queensland).
1,728	Bourke (New South Wales).
1,936	Narromine (New South Wales).
2,111	Cootamundra (New South Wales).
2,396	Melbourne (Victoria).

Full information regarding the facilities actually available at each station will be furnished by officials stationed at Port Darwin, Cloncurry, Charleville and Narromine

In order to minimise the risk to competitors while flying over the sea from the Island of Timor to Port Darwin, the Australian Defence Department has also arranged for the Royal Australian Navy, when warned by competitors, to maintain a patrol between these points

The Government of Australia has arranged for the competitors for the £10,000 prize and M. Poulet to receive daily weather forecasts after reaching Java.

The Commonwealth meteorologist will prepare the forecast, which will be wirelessed from Port Darwin to Timor, and cabled thence to Batavia, where the British Consul will transmit the message to the aviators.

THE VICKERS "VIMY" MACHINE.

The following telegram has been received from Basra dated Nov. 21st :—

Last cable Cairo 18th. Left next day 10.30. Dull weather. Crossed Canal Kantara, then over Romani, along coast under thick cloud to Gaza. Turned inland to Ramleh, then Haifa. Owing heavy rain flew low to Jordon over Sea Galilee, thence Damascus. Interesting seeing old places again recalling memories war. Landed Damascus three. Met many old R.A.F. friends.

Nineteenth delayed until eleven; first rain since March; ground getting sticky, oiled tyres to stop mud sticking and left. Flew low Tadmor. Turned east. Crossed desert Abu Kemal. Followed Euphrates. Met head wind, landed Ramadie battlefield at dusk. Pegged down machine. Heavy gale night. Turned out troops hold machine. Anxious time two hours, but Vimy weathered storm.

Twentieth, left Ramadie one fifteen. Good wind. First good flying day of journey. Passed Bagdad, Kut, Garden Eden. Landed Basra four forty.

Overhauling to-day. Bunder Abbas to-morrow. Yesterday weather cheered all considerably after ten days trying condition. Crew well. Engines behaving beautifully.—ROSS SMITH.

The following telegram, dated Nov. 30th, has been received from Milan :—

"Ross Smith left Bushire twenty-third instant."

The Vickers "Vimy" arrived at Calcutta at 1.30 p.m. on Nov. 28th and left for Akyab at 8.30 a.m. on the next day. Akyab was reached at 2 p.m. and Rangoon at noon on Nov. 30th. Forty-five minutes later M. Poulet landed with his Caudron biplane (two 110 h.p. Le Rhone engines).

Both pilots arranged to leave Rangoon for Bangkok at 7 a.m. on Dec. 1st.

The following cablegram, dated Dec. 4th, has been received from Singapore :—

We left Rangoon at 7 on Dec. 1st and arrived at Bangkok at 1. We passed through a heavy storm above the mountains. South-east of Moulmein a thick cloud delayed us. We climbed to 9,000 ft. and got over the worst of it. Then we followed the River Menam south. Every convenience was prepared for us by the Siamese Aviation Corps.

At Bangkok the greatest assistance and courtesy was shown by Prince Pitsanoluke and the aviation corps. We left Bangkok on Dec. 2nd. We were escorted to Singora for the first 50 miles by four Siamese machines. Course south along the east coast of Malay for the first two hours was good, but we then met a heavy monsoon.

The wind was strong and changeable, sometimes helping us and sometimes against us. It was necessary to fly at the height of 500 ft. for three hours, following the coast, almost blinded by the rain, but the country was impossible for landing and we had to continue, hoping for the best in the worst flying conditions ever encountered. The last hour was better.

The aerodrome at Singora is bad and stumpy. We had to land in a cross wind, on a small dry patch. We got safely down with luck, but later, in "taxi-ing" the machine, the tail-skid caught a root and broke a fitting. The damage is not serious. The local population showed great interest at the sight of the aeroplane.

I decided that, owing to the weather, I could not reach Singapore without more petrol, and wired to the Asiatic Petroleum Company at Penang to send some urgently. During the night there were heavy squalls, and the crew held the machine all night. Great assistance and kindly hospitality was given by Prince Yugala and the local officials.

Dec. 3rd.—Torrential rain with wind, and we repaired the skid and the crew were wet through with working at the machine all day. Petrol arrived in the evening, but it was raining too hard to put in.

Dec. 4th.—My birthday. Had decided to try for Singapore. We left Singora at 10 and arrived at Singapore at 5. The take-off at Singora was very rough, but convicts had cleared the stumps yesterday. The aerodrome was very wet in patches. We were lucky to get off in a cross wind. Rain all the way. We flew at a height of 2,000 ft. to 500 ft. all the way. A great reception here and a huge crowd. Hope to reach Java on the 6th and Darwin on the 10th. Vimy and crew all well.—ROSS SMITH.

A Reuter message from Batavia, dated Dec. 6th, stated that Capt. Ross Smith arrived at Kalidjatti, near Bandoeng, West Java, at 4.7 p.m. on that day.

THE BLACKBURN "KANGAROO."

The Air Ministry announced on Dec. 4th that the Blackburn "Kangaroo" (two 250-h.p. Rolls-Royce "Falcon" engines), which left Hounslow on Nov. 21st with Capt. Wilkins, M.C., and Lieuts. Rendle, Williams, and Potts arrived at Taranto at 2.0 p.m. on Dec. 3rd, and left for Suda Bay (Crete) on the next day.

THE SOPWITH MACHINE.

The only reason for the silence of Capt. Matthews and Serjt. Kay seems to be that they have been held up at Mayence by very bad weather. On Nov. 29th they decided to proceed on the way to Belgrade. They landed at Vienna in the evening owing to the weather and shortage of petrol.

THE MARTINSYDE MACHINE.

Capt. C. E. Howell, D.S.O., M.C., D.F.C., the pilot of the Martinsyde machine, holds a remarkable record of war service so far as Australian aviators are concerned. He was in the Australian Infantry until 1916, when he joined the Royal Flying Corps. He quickly qualified as a pilot, and the records show that he has 2,000 hours' flying time to his account.

Capt. Howell crashed 32 enemy aeroplanes, and in addition he is officially credited with bringing down eleven others out of control, and shooting down a number of balloons and kites. His D.S.O. was gained in a fight over the enemy lines, when in twenty minutes he accounted for seven enemy aeroplanes. On this occasion his own machine was so badly damaged that it was with great difficulty he returned to his own aerodrome. His assistant is Air-Mechanic Henry Fraser.

A correspondent writes : Before proceeding to Hounslow on Dec. 2nd the Martinsyde machine (275-h.p. Rolls-Royce "Falcon" engine) circled over the Martinsyde works at Woking for some time by way of farewell, and came down very low. The pilot, Capt. Howell, D.S.O., M.C., D.F.C., was reported to have been very pleased with the behaviour of the machine on its final test flights.

A description of the machine was given in the "Aeronautical Engineering" supplement on Nov. 5th. It will be remembered that the machine is to be fitted with floats at Calcutta, and will then fly to Australia as a seaplane.

The start was delayed for a week by adverse weather. Capt. Howell became determined not to delay further, and left Hounslow Aerodrome at 9.24 a.m. on Dec. 4th, during an interval between two heavy rain storms in weather which was not favourable. The machine rose from the ground very quickly in the face of a strong westerly wind. It climbed to a height of about 2,000 ft. before Capt. Howell waved a last farewell to his friends on the ground, when he turned towards the coast, and, flying down wind at a great speed, he was very soon lost to sight in the rain clouds that prevailed.

Messages expressing good wishes were received from Capt. H.R.H. the Prince Albert, K.G., R.A.F., Mr. Winston Churchill, M.P., and Major-Gen. Sir F. H. Sykes, C.B.E., K.C.B., C.M.G.

Martinsydes, Ltd,, received a cable on Dec. 6th, which stated that Capt. Howell landed at Pisa on Dec. 5th at 4.0 p.m.

The machine arrived at Capua on Dec. 6th. On the 7th she was held up by the weather. On the 8th she arrived at Taranto and was leaving on the 9th for Suda Bay.

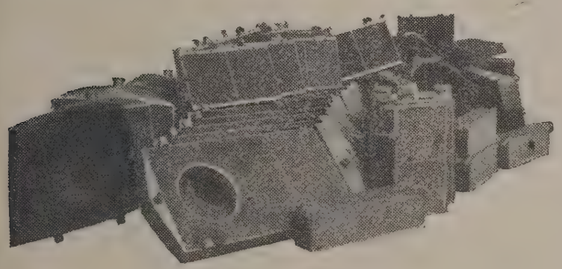
There are at present five aeroplanes on the way to Australia, and the points they have reached, according to the latest information, are shown below :—

Date of Start.—Oct. 14th.—M. Poulet Caudron. Bangkok.
Oct. 22nd.—Capt. Matthews. Sopwith. Vienna.
Nov. 12th.—Capt. Ross Smith. Vickers Vimy. Java.
Nov. 21st.—Capt. Wilkins. Blackburn. Taranto.
Dec. 4th.—Capt. Howell. Martinsyde. Pisa.

ACCLES & POLLOCK, LIMITED.

REPUTATION.

As manufacturers of weldless steel tubing, as tube manipulators, and as steel press-workers, we have a world-wide reputation for all-round excellence. Multitudinous are our products, and our reputation is behind every item.



We are right in the forefront with our "Apollo" tubular box spanners. They are becoming increasingly popular in progressive engineering workshops. We make several patterns including a special set for Ford Cars—all of which leave absolutely nothing to be desired in tubular spanner construction. Ask for our Spanner catalogue and price list. We can supply aircraft parts in big quantities, as in this connection we are specialists in tapering, bending, trapping, welding, and all other classes of tube manipulation and presswork.

To-day we recognise that aircraft builders have more time to manipulate their own components, but they need steel tubing, and we supply the very best. Further, let our war experience assist you in this matter of steel tubing and steel presswork. We may be able to save you money, because we have the tools for many components.

AIR FORCE.

AIR MINISTRY, Dec. 2nd

R.A.F.—The following are granted permanent commns. in the ranks stated, with effect from Aug. 1st:—

Flt. Lts.—A. Gray, M.C. (A.), *A. P. Maurice, D.F.C. (A.), *O. C. Bryson, M.C., D.F.C., A.M. (A.), J. A. MacNab (O.), *D. S. Earp (O.).

Flying Officers.—*A. L. M. Van der Byl (A.), R. M. Trevethan, M.C. (A.), G. E. Randall, D.F.C. (A.), C. L. Wauchope (A.), A. Jerrard, V.C. (A.), J. M. Mason, D.S.C., D.F.C. (A.), L. C. Hootton, M.C. (A.), *H. C. E. Bockett-Pugh (A. and S.), *L. M. Hilton (A.), *A. F. Lang (O.), C. A. Bouchier, D.F.C. (A.), H. A. Haines, D.F.C. (A.).

The classification of Capt. A. A. B. Thomson is "(A.)," and not "(S.)," as stated in "Gazette," Aug. 1st.

The notification in "Gazette," Aug. 1st, appointing Maj. C. S. Danby, M.C. (A.), to a permanent commn is cancelled.

The notification in "Gazette," Aug. 1st, appointing Capt. T. Gran (T.) to a permanent commn. is cancelled

The following temp. appt. is made at the Air Ministry:—Staff Officer, 3rd Class.—(P.) Flt. Lt. A. H. Stradling, Nov. 18th.

FLYING BRANCH.—Capt. C. B. Dalison, A.F.C., is graded for purposes of pay and allowances as Maj. while empld. as Maj (A. and S.), from May 1st to Oct. 23rd (substituted for notification in "Gazette," Oct. 21st).

Flt. Lt. (actg. Sqdn. Ldr.) S. W. Dunckley relinquishes the actg. rank of Sqdn. Ldr. on ceasing to be empld. as Sqdn. Ldr. (A.), Nov. 11th.

Flying Officer (actg. Flt. Lt.) E. Burney, M.C., relinquishes the actg. rank of Flt. Lt. on ceasing to be empld. as Flt. Lt. (A.), Nov. 11th.

Sec. Lt. S. Soothill to be Lt., Nov. 13th, 1918

Pilot Officer N. Hickson to be Flying Officer, Sept. 9th.

Sec. Lt. W. C. Snowdon (late Gen. List, R.F.C., on prob.) is confirmed in rank as Sec. Lt. (O.), June 3rd, 1918.

The following relinquish their temp. R.A.F. commns. on return to Army duty:—Flying Officer K. M. Harris (Sec. Lt., Suff. R.), Nov. 1st; Flying Officer C. Joiner (Lt., E. Surr. R.), Nov 8th; Flight Lt. C. R. Richardson (Lt., E. Yorks. R.), Nov. 10th; Flying Officer E. G. Williams (Lt., Essex R.), Nov. 10th; Flying Officer P. Perfect (Lt., K.O.S.B.), Nov. 12th; Flight Lt. R. F. S. Manduit, M.C. (Lt., Dragn. Gds.), Nov. 17th; Flying Officer J. C. C. Piggott (Lt., Duke of Corn. L.I.), Nov. 18th.

The following relinquish their temp. R.A.F. commns. on return to Naval duty:—Sqdn. Ldr. R. S. Robinson, O.B.E. (Lt.-Comdr., R.N.), Oct. 14th; Pilot Officer D. P. Davidson (Sub. Lt., R.N.), Nov. 3rd; Flying Officer R. B. Gibb (actg. Lt., R.N.), Nov. 8th.

Flight Lt. G. E. Wildman-Lushington (Capt., R. Marines) relinquishes his temp. R.A.C. commn. on return to duty with R. Marines, Oct. 23rd.

Transferred to unempld. list:—Lt. G. Smith, Jan. 30th; Sec. Lt. (Hon. Lt.) A. C. McKinnon, Feb 1st; Sec. Lt. N. Howl, Feb. 4th; Sec. Lt. C. E. Fabian, March 10th; Sec. Lt. S. G. Amor, March 15th; Lt. F. E. Davy, March 19th, Sec. Lt. R. L. Ford, March 23rd; Lt. J. E. E. Fenton, March 25th; Lt. E. V. Holland, March 30th; Sec. Lt. L. H. Eyres, April 3rd; Sec. Lt. R. Wilkinson, April 13th; Sec. Lt. P. Rockley, April 15th; Lt. R. Kelly (substituted for notification in "Gazette" of Sept. 5th), Sec. Lt. W. A. McLeod, April 20th; Sec. Lt. F. K. Wilson, May 19th; Capt. H. L. Hitch, May 28th; Lt. G. E. Ransom, May 31st; Lt. T. F. Burrill, June 13th; Capt. B. A. Smart, D.S.O., June 29th (substituted for notification in "Gazette" of July 4th); Sec. Lt. A. B. Wilkinson, July 6th; Sec. Lt. F. Carroll, Lt. J. A. Chambers, July 12th; Maj. K. L. Caldwell, M.C., D.F.C., Sec. Lt. G. E. Cartwright, July 17th; Lt. C. J. Chabot, July 20th; Lt. E. Lindup, M.C., Aug. 1st; Sec. Lt. W. D. Wood, Aug. 7th; Sec. Lt. F. L. Chapin, Lt. E. P. C. Godsil, Aug. 22nd; Sec. Lt. A. R. Wylde, Aug. 27th; Sec. Lt. C. C. Chapman, Lt. F. M. Wood, Aug. 20th, Sec. Lt. E. H. Sansom, Sept. 6th; Sec. Lt. W. G. Harris, Sec. Lt. B. P. Hawkins, Sept. 10th; Lt. R. Lucovich, M.C., Sept. 18th; Lt. C. Jackson, Sept. 19th (substituted for notification in the "Gazette" of Nov. 21st); Sec. Lt. T. M. Harries, D.F.C., Sept 20th; Sec. Lt. I. Fender, Sept. 22nd; Capt. H. L. Wood, Sept 26th; Sec. Lt. W. C. Campain, Sec. Lt. A. P. Cannon, Lt. F. Carr, Sec. Lt. J. E. Charlebois, Sec. Lt. C. Hancock, Sec. Lt. A. J. Lacasse, Sec. Lt. B. C. Longmire (substituted for notification in the "Gazette" of July 22nd), Sept. 28th; Sec. Lt. H. W. P. Carew, Lt. W. J. Carroll, Capt. B. N. Harrop, Sec. Lt. W. Haviland, Sec. Lt. J. T. J. McA. Nulty, Sec. Lt. E. P. McCarville, Lt. E. C. MacDonnell, Sec. Lt. J. MacDonell, Sec. Lt. J. MacFarlane, Sec. Lt. W. H. Young, Sept. 20th; Sec. Lt. J. L. Merrington, Sept 30th; Lt. J. J. A. Thompson, Oct. 6th; Sec. Lt. (Hon. Lt.) A. Dunton, Lt. K. Y. Gliddon, Oct. 9th; Sec. Lt. T. Atkinson, Oct. 10th; Sec. Lt. C. F. Lawson, Oct 11th; Maj. H. F. Champion, A.F.C., Oct 12th; Lt. E. J. A. Burke, Oct. 13th (substituted for notification in the "Gazette" of Nov. 4th); Sec. Lt. J. W. Davies, Oct 16th; Sec. Lt. G. B. Allen, Sec. Lt. R. N. Bullock, Sec. Lt. F. Laughton, Oct. 20th; Sec. Lt. R. B. Stock, Oct. 28th (substituted for the notification in the "Gazette" of Oct. 24th); Sec. Lt. T. V. Callard, Oct 29th (substituted for notification in the "Gazette" of Oct. 24th). Lt. R. Locke, Oct 30th (substituted for notification in the "Gazette" of Nov 14th, wherein this officer was shown under Technical Branch); Sec. Lt. C. F. Robinson, Nov. 1st; Sec. Lt. H. P. Lawson, Sec. Lt. R. D. B. Wood, Nov. 2nd; Sec. Lt. J. D. Bush, Lt. J. B. Purefoy, Sec. Lt. J. Withers, Nov 3rd; Sec. Lt. (Hon. Lt.) G. G. Ross-Smith (R.G.A.), Nov 4th (substituted for notification in "Gazette," Nov. 14th); Sec. Lt. J. O. E. Carrington, Nov. 7th; Sec. Lt. F. M. Seabourne, Nov. 10th; Lt. C. H. Cameron, Lt. H. F. Lea, Lt. R. F. McKae, Nov. 13th; Lt. P. Phillips, Nov. 22nd; Sec. Lt. S. S. George, Lt. I. A. Romyn, Nov. 23rd; Sec. Lt. (Hon. Lt.) E. H. Colman, Sec. Lt. J. H. Gibbons, Nov. 29th; Lt. K. H. Carr, Nov. 30th.

The following Lts. relinquish their commns. on account of ill-health, and are permitted to retain their rank:—D. MacGregor (K.O.S.B.) (caused by wounds), Nov. 13th; C. A. Bradnam (contracted on active service), Nov. 22nd; N. W. R. Mawle, D.F.C. (Lond. R., T.F.) (caused by wounds), Nov. 24th; D. G. H. Meade (contracted on active service), Nov. 20th.

The following Sec. Lts. relinquish their commns. on account of ill-health (caused by wounds), and are permitted to retain their rank:—C. Houlgrave, E. J. Norris, Nov. 25th; Sec. Lt. R. J. Barnes resigns his commn., Aug. 26th, 1918.

The surname of Lt. A. H. Ashton is as now described, and not "Ashtch," as stated in "Gazette," Nov. 14th.

The Christian names of Sec. Lt. Henry Dan Lewis are as now described, and not "Henry Van," as stated in "Gazette," Nov. 4th.

The initials of Lt. J. O. Barclay are as now described, and not "J. B.," as stated in "Gazette," Jan. 21st.

The surname of Lt. F. M. McLellan, D.F.C., is as now described, and not "McLennan," as stated in "Gazette," July 22nd.

The notification in "Gazette," Oct. 21st, concerning Sec. Lt. L. T. Lawrence is cancelled. "Gazette," April 18th, to stand.

The notification in "Gazette," April 1st, concerning Sec. Lt. N. H. Howe is cancelled

ADMINISTRATIVE BRANCH.—Flying Officer F. V. Goode to be Flying Officer from (S.O.), Nov. 10th.

Flying Officer (actg. Flight Lt.) W. H. Hoile relinquishes the actg. rank of Flight Lt. on ceasing to be empld. as Flight Lt., Nov. 13th.

Sec. Lt. E. Staples (since demobilised) to be Lt., Nov. 13th, 1918.

Sec. Lt. T. Mumford to be actg. Lt. whilst empld. as Lt., from Aug. 8th, 1918, to April 30th

The following Flying Officers relinquish their temp. R.A.F. commns. on return to Army duty:—G. W. Panter, M.B.E. (Lt., R.I. Rif.), Oct. 15th; G. W. Nelson (Lt., Gord. Highrs.), Nov. 6th; T. H. Holmes (Lt., R.F.A.), Nov. 15th; (Hon. Flight Lt.) C. H. Markham (Capt., North'd Fus.), Nov. 19th.

Transferred to the unempld. list:—Sec. Lt. A. J. P. Evans, March 21st; Lt. W. Wallace, M.C., April 15th; Sec. Lt. F. Harris, July 18th; Sec. Lt. C. C. Lotter, Aug. 7th; Sec. Lt. A. Gibson, Aug. 27th; Lt. F. R. C. Davidson, Sept. 7th; Lt. S. L. Empson, Capt. L. F. Lambert, Sept. 8th; Lt. E. H. A. Lockwood, Sept. 11th; Capt. F. Steel, O.B.E., Sept. 23rd; Lt. B. F. MacDonald, Sept. 26th; Sec. Lt. G. F. Carefoot, Sept. 28th; Sec. Lt. J. D. Grant, Sept. 29th; Lt. J. W. Mennie, Oct. 18th; Sec. Lt. T. Caine, Oct. 20th; Capt. T. L. Williams, M.C., Nov. 13th; Lt. C. S. Chamberlain, Nov. 24th; Lt. A. E. Houghton (Sec. Lt., Extra Regimentally Empld. List) resigns his commn., Dec. 3rd.

The following Sec. Lts. relinquish their comms. on account of ill-health, and are permitted to retain their rank:—B. W. A. Ordish, G. R. Smith (contracted on active service), Nov. 26th; G. N. Wood, Dec. 7th, 1918 (substituted for notification in the "Gazette" of Aug. 6th, 1918).

The notification in the "Gazette" of March 11th concerning Lt. N. H. Kemp is cancelled.

The notifications in the "Gazettes" of July 9th, 1918, and Dec. 24th, 1918, concerning Sec. Lt. (Hon. Capt.) F. Grave are cancelled.

TECHNICAL BRANCH.—F. Grave (Capt. and Qrmr., Ldn. R., T.F.) is granted a temp. commn. as Capt., Grade (B), April 1st, 1918, without the pay and allowances of that rank prior to May 22nd, 1918

Flying Officer J. L. Denman to be Flying Officer from (S.O.), Oct. 18th (substituted for notification in the "Gazette" of Nov. 21st).

Lt. W. L. Head to be Lt., Grade (B), from ("A. and S."), Aug. 9th (substituted for notification in the "Gazette" of Aug. 30th, 1918).

Sec. Lts. to be Lts.:—S. A. Alder, April 2nd, 1918, without the pay and allowances of that rank prior to Aug. 28th, 1918; V. P. Pereth, June 3rd; E. Downer, June 6th.

Pilot Officers to be Flying Officers:—A. D. Edwards, Aug 5th; E. W. Dawson, A. E. Faver, J. H. J. Footman, L. J. Lester, R. Smith, Oct. 1st.

Pilot Officer (actg. Flight Lt.) A. Jukes relinquishes the actg. rank of Flight Lt. on ceasing to be empld. as Flight Lt., from (S.O.), Oct. 18th.

Flying Officer G. P. N. Hardy (Lt., R.G.A.) relinquishes his temp. R.A.F. commn. on return to Army duty, Nov. 17th.

Transferred to the unempld. list:—Sec. Lt. B. Jones, Feb. 4th; Sec. Lt. H. B. George, July 24th (substituted for notification in the "Gazette" of Sept. 12th); Sec. Lt. (Hon. Capt.) T. R. Duff, July 29th; Lt. (Hon. Maj.) A. H. W. Saunders-Knox-Gore, Aug. 9th; Lt. J. W. Cairns, Sept. 12th; Sec. Lt. (Hon. Lt.) J. L. Bicknell, Oct. 6th; Lt. N. D. Bryce, Oct. 9th; Capt. A. M. Low, Oct. 14th; Sec. Lt. W. Parkinson, Oct. 28th (substituted for notification in the "Gazette" of Nov. 7th); Sec. Lt. C. M. Byham, Oct. 29th (substituted for notification in the "Gazette" of Oct. 28th); Lt. K. E. Beswick, Nov. 4th (substituted for notification in the "Gazette" of Nov. 18th); Sec. Lt. H. J. Wadkin, Nov. 5th; Sec. Lt. J. W. Tattersall, Nov. 6th; Maj. J. O. James, Nov. 13th; Capt. S. McClure, O.B.E., Nov. 20th; Capt. H. W. Bamber, Capt. A. W. Davie, Nov. 22nd

Lt. H. J. Murphy relinquishes his commn. on account of ill-health contracted on active service, and is granted the rank of Capt., Nov. 26th.

The initial of Sec. Lt. H. Jacques is as now described, and not "U.," as stated in the "Gazette" of Nov. 18th.

The notifications in the "Gazettes" of Feb. 11th, March 18th, May 20th, concerning Lt. (Hon. Capt.) F. Grave are cancelled.

MEDICAL BRANCH.—Transferred to the unempld. list:—Capt. A. P. Woollright, April 18th; Capt. V. T. Ellwood, Nov. 25th.

Capt. H. N. Wright relinquishes his commn. on account of ill-health contracted on active service, and is permitted to retain his rank. Nov. 25th.

The initials of Capt. A. Moir-Gray are as now described, and not "Q.," as stated in the "Gazette" of Nov. 14th.

MEMORANDA.—Pilot Officers to be Flying Officers:—G. H. Brown, W. J. Ryder, Oct. 1st.

The following overseas Cadet is granted a temp. commn. as Sec. Lt., with effect from Feb. 15th, and relinquishes his commn. with permission to retain his rank from the day following demobilisation:—316124 D. A. Aberdeen.

The following overseas Cadet is granted an hon. commn. as Sec. Lt.:—154907 R. Ingram, Jan. 1st

The following Probationary Flight Officers are granted hon. commns. as Sec. Lts.:—B. C. Oades, Nov. 16th, 1918; E. F. Northey, Dec. 17th, 1918; C. W. D. Outred, Jan. 23rd; R. E. Haswell, Jan. 24th; R. H. Hardman, Feb. 12th; J. G. Heriot, Feb. 13th; C. L. Harrison, Feb. 19th; C. Norris, March 5th; C. L. Marn, March 7th; H. E. Mock, March 9th; H. W. Merrill, March 18th; H. S. McLeod, March 10th; L. J. Hartnett, April 2nd; D. B. Mincard, April 6th; R. S. Harrison, April 8th; T. E. Hall, April 12th; S. B. McBain, April 14th; H. H. Mullens, April 28th; C. Moody, May 2nd; L. G. Hicks, July 24th; D. H. O. Oakley, Sept. 26th.

* Subject to Medical Fitness.

You couldn't see it from below

but it's nevertheless a fact—a fact which every flying man and aircraft manufacturer should note—that the majority of the machines competing in the Aerial Derby, including the three which were placed 1st, 2nd and 3rd, at the end of the race, were fitted with

AUSTER TRIPLEX AERO WIND SHIELDS

And that proves what the men who "know" think of them.

Let us have YOUR enquiries.

The following Cadets are granted hon. commns. as Sec. Lts.:—179188 H. B. T. Curtis, Jan. 13th; 182487 F. Jeffery, Jan. 15th; 299061 E. L. Walsh, March 2nd; 11205 H. D. Hoskins, March 20th; 110418 R. G. Veryard, April 22nd (substituted for notification in the "Gazette" of July 25th, wherein this Cadet was described as "110410 Richard Joe Veryard"); M2/204666 C. F. Keate, May 3rd; 152337 G. McNeill, May 6th; 33292 A. R. Quaife, May 29th; M2/102920 A. G. Brayshaw, June 2cth; 261591 J. H. R. Nixon, Nov. 8th.

Wing Comdr. M. G. Christie, C.M.G., D.S.O., M.C., is placed on the half-pay list, Dec. 3rd.

Lt.-Col. (actg. Col.) B. H. O. Armstrong, C.M.G. (Maj. (Bt. Lt.-Col.) R.E.), relinquishes his commn. on ceasing to be empld., Nov. 15th.

The following temp. Hon. Lts. relinquish their commns. on ceasing to be empld.:—R. Richardson, H. J. Wilkins, Sept. 16th.

Transferred to the unempld. list:—Capt. J. H. Tyler, M.B.E., from (S.O.), May 2nd (substituted for notification in "Gazette," July 15th, wherein this officer was shown under Flying Branch); Capt. G. S. Lardner, from (S.O.), Oct. 10th.

The notification in "Gazette," July 25th, concerning 177148 Cadet W. McK. Auld is cancelled.

The notification in "Gazette," May 2nd, concerning 27941 Cadet D. Avlam is cancelled.

CENTRAL CHANCERY OF THE ORDERS OF KNIGHTHOOD.

ST. JAMES'S PALACE, S.W.1, Dec. 5th.

The three Warrants set forth below are concerned with the establishment of the Distinguished Flying Cross, the Air Force Cross, the Distinguished Flying Medal and the Air Force Medal, the institution of which was announced in the "London Gazette" of June 3rd, 1918 (No. 30723, page 6533):—

ROYAL WARRANT INSTITUTING DECORATIONS AND MEDALS FOR THE ROYAL AIR FORCE.

GEORGE R.I.

GEORGE THE FIFTH, by the Grace of God of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the Seas King, Defender of the Faith, Emperor of India: To all to whom these presents shall come. Greeting!

Whereas We are desirous of signifying Our appreciation of acts of valour, courage, and devotion to duty performed by Officers and Men in Our Air Force and in the Air Forces of Our Self-governing Dominions beyond the Seas, We do hereby, for Us, Our heirs and successors, institute and create two decorations to be designated the Distinguished Flying Cross and the Air Force Cross, and two Medals, to be designated the Distinguished Flying Medal and the Air Force Medal, and We do hereby direct that the following regulations shall be made governing the said Decorations and Medals:—

Firstly. It is ordained that the Distinguished Flying Cross shall be granted only to such Officers and Warrant Officers of Our said Forces as shall be recommended to Us for an act or acts of valour, courage, or devotion to duty performed whilst flying in active operations against the enemy.

Secondly. It is ordained that the Distinguished Flying Cross shall be silver and shall consist of a Cross flory terminated in the horizontal and base bars with bombs, the upper bar terminating with a rose, surmounted by another cross composed of aeroplane propellers charged in the centre with a roundel within a wreath of laurels a rose winged ensigned by an Imperial Crown thereon the letters R.A.F. On the reverse the Royal Cypher above the date 1918. The whole attached to the clasp and ribbon by two sprigs of laurel.

Thirdly. It is ordained that the Distinguished Flying Cross shall be worn on the left breast pendant from a ribbon one inch and a quarter in width, which shall be in colour violet and white in alternate horizontal stripes of one-eighth of an inch in depth.

Fourthly. It is ordained that the award of the Distinguished Flying Cross shall entitle the recipient to have the initials D.F.C. appended to his name.

Fifthly. It is ordained that the Air Force Cross shall be granted only to such Officers and Warrant Officers of Our said Forces as shall be recommended to us for an act or acts of valour, courage, or devotion to duty whilst flying though not in active operations against the enemy.

Sixthly. It is ordained that the Air Force Cross shall be silver and shall consist of a thunderbolt in the form of a cross, the arms conjoined by wings, the base bar terminating with a bomb surmounted by another cross composed of aeroplane propellers, the four ends enscribed with the letters G.V.R.I. In the centre a roundel thereon, a representation of Hermes mounted on a hawk in flight bestowing a wreath. On the reverse the Royal Cypher above the date 1918. The whole ensigned by an Imperial Crown and attached to the clasp and ribbon by two sprigs of laurel.

Seventhly. It is ordained that the Air Force Cross shall be worn on the left breast pendant from a ribbon one inch and a quarter in width, which shall be in colour red and white in alternate horizontal stripes of one-eighth of an inch in depth.

Eighthly. It is ordained that the award of the Air Force Cross shall entitle the recipient to have the initials A.F.C. appended to his name.

Ninthly. It is ordained that the Distinguished Flying Medal shall be granted only to such Non-commissioned Officers and Men of Our said Forces as shall be recommended to Us for an act or acts of valour, courage, or devotion to duty performed whilst flying in active operations against the enemy.

Tenthly. It is ordained that the Distinguished Flying Medal shall be silver and oval-shaped, bearing Our Effigy on the obverse and on the reverse within a wreath of laurel a representation of Athena Nike seated on an aeroplane, a hawk rising from her right arm above the words "for Courage." The whole ensigned by a bomb attached to the clasp and ribbon by two wings.

Eleventhly. It is ordained that the Distinguished Flying Medal shall be worn on the left breast pendant from a ribbon of one inch and a quarter in width, which shall be in colour violet and white in alternate horizontal stripes of one-sixteenth of an inch in depth.

Twelfthly. It is ordained that the award of the Distinguished Flying Medal shall entitle the recipient to have the initials D.F.M. appended to his name.

Thirteenthly. It is ordained that the Air Force Medal shall be granted only to such Non-commissioned Officers and Men of Our said Forces as shall be recommended to Us for an act or acts of valour, courage, or devotion to duty performed whilst flying, though not in active operations against the enemy.

Fourteenthly. It is ordained that the Air Force Medal shall be silver and oval-shaped, bearing Our Effigy on the obverse and on the reverse within a wreath of laurel a representation of Hermes mounted on a hawk in flight bestowing a wreath. The whole ensigned by a bomb attached to the clasp and ribbon by two wings.

Fifteenthly. It is ordained that the Air Force Medal shall be worn on the left breast pendant from a ribbon one inch and a quarter in width, which shall be in colour red and white in alternate horizontal stripes of one-sixteenth of an inch in depth.

Sixteenthly. It is ordained that the award of the Air Force Medal shall entitle the recipient to have the initials A.F.M. appended to his name.

Seventeenthly. It is ordained that Foreign Officers and gradings of an equivalent rank to those above mentioned who have been associated in Military operations with Our Army or Our Indian, Dominion, or Colonial Military Forces, shall be eligible for the award of the Distinguished Flying Cross, the Air Force Cross, the Distinguished Flying Medal, and the Air Force Medal.

Eighteenthly. It is ordained that in cases where Officers, Warrant Officers, and Men who have been awarded one of the above decorations or medals shall be recommended for a further act of valour, courage, or devotion to duty, he shall be awarded a bar to be attached to the ribbon by which the decoration or medal is suspended, and for every additional such Act an additional bar may be awarded.

Nineteenthly. It is ordained that the names of those upon whom We may be pleased to confer the above decorations and medals shall be published in the "London Gazette," and that a Register thereof shall be kept in the Office of Our Secretary of State for the Royal Air Force.

Twentiethly. It is ordained that any person whom by an especial Warrant under Our Royal Sign Manual We declare to have forfeited the above decorations, medals, and bars shall return the same to the Office of Our Secretary of State for the Royal Air Force, and that his name shall be erased from the Register of those upon whom the said decorations, medals, and bars shall have been conferred.

Lastly. We reserve to Ourself, Our heirs and successors, full power of annulling, altering, abrogating, augmenting, interpreting, or dispensing with these regulations, or any part thereof, by a notification under Our Royal Sign Manual.

Given at Our Court at St. James's under Our Sign Manual this 3rd day of June, in the ninth year of Our Reign and in the year of Our Lord One thousand nine hundred and eighteen.

By the Sovereign's Command, WILLIAM WEIR.

ROYAL WARRANT AMENDING THE THIRD, SEVENTH, ELEVENTH, AND FIFTEENTH CLAUSES OF THE ROYAL WARRANT INSTITUTING DECORATIONS AND MEDALS FOR THE ROYAL AIR FORCE.

GEORGE R.I.

GEORGE THE FIFTH, by the Grace of God of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the Seas King, Defender of the Faith, Emperor of India: To all to whom these presents shall come. Greeting!

Whereas We did, by Royal Warrant under Our Sign Manual dated June 3rd, 1918, institute and create two decorations designated the Distinguished Flying Cross and the Air Force Cross and two Medals designated the Distinguished Flying Medal and the Air Force Medal to be awarded to Officers and Men in Our Air Force and in the Air Forces of Our Self-governing Dominions beyond the Seas in recognition of acts of valour, courage, and devotion to duty.

And whereas We are desirous that certain alterations should be made in the regulations governing the said decorations and medals.

Now, therefore, We do by these Presents for Us, Our Heirs and Successors, ordain that the following Ordinances shall be substituted for the corresponding Ordinances in the said Royal Warrant, and shall henceforth be construed and have the same effect as if they formed part of the said Royal Warrant:—

Thirdly. It is ordained that the Distinguished Flying Cross shall be worn on the left breast pendant from a ribbon one inch and a quarter in width which shall be in colour violet and white in alternate diagonal stripes of one-eighth of an inch in width running at an angle of 45 degrees from left to right.

Seventhly. It is ordained that the Air Force Medal shall be worn on the left breast pendant from a ribbon one inch and a quarter in width which shall be in colour red and white in alternate diagonal stripes of one-eighth of an inch in width running at an angle of 45 degrees from left to right.

Eleventhly. It is ordained that the Distinguished Flying Medal shall be worn on the left breast pendant from a ribbon of one inch and a quarter in width which shall be in colour violet and white in alternate diagonal stripes of one-sixteenth of an inch in width, running at an angle of 45 degrees from left to right.

Fifteenthly. It is ordained that the Air Force Medal shall be worn on the left breast pendant from a ribbon one inch and a quarter in width which shall be in colour red and white in alternate diagonal stripes of one-sixteenth of an inch in width running at an angle of 45 degrees from left to right.

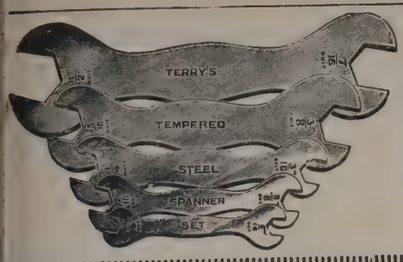
Given at Our Court at St. James's this 24th day of July, in the tenth year of Our Reign and in the year of Our Lord One thousand nine hundred and nineteen.

W. S. CHURCHILL, by His Majesty's Command.

ROYAL WARRANT ENABLING THE AIR FORCE CROSS AND AIR FORCE MEDAL TO BE CONFERRED UPON CIVILIANS.

GEORGE R.I.

GEORGE THE FIFTH, by the Grace of God of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the Seas King, Defender of the Faith, Emperor of India: To all to whom these presents shall come. Greeting!



Whereas We did, by Royal Warrant under Our Sign Manual dated June 3rd, 1918, institute and create two decorations designated the Distinguished Flying Cross and the Air Force Cross and two Medals designated the Distinguished Flying Medal and the Air Force Medal to be awarded to Officers and Men in Our Air Force and in the Air Forces of Our Self-governing Dominions beyond the Seas in recognition of acts of valour, courage, and devotion to duty.

And whereas We are desirous that certain alterations should be made in the regulations governing the said decorations and medals.

Now, therefore, We do by these Presents for Us, Our Heirs and Successors, ordain that the following Ordinances shall be substituted for the corresponding Ordinances in the said Royal Warrant, and shall henceforth be construed and have the same effect as if they formed part of the said Royal Warrant:—

Fifthly. It is ordained that the Air Force Cross shall be granted to such Officers and Warrant Officers of Our said Forces as shall be recommended to Us for an act or acts of valour, courage, or devotion to duty whilst flying though not in active operations against the enemy, and may also be granted to individuals not belonging to Our Air Force (whether Naval, Military, or Civil) who render distinguished service to Aviation in actual flying.

Thirteenthly. It is ordained that the Air Force Medal shall be granted to such Non-commissioned Officers and Men of Our said Forces as shall be recommended to Us for an act or acts of valour

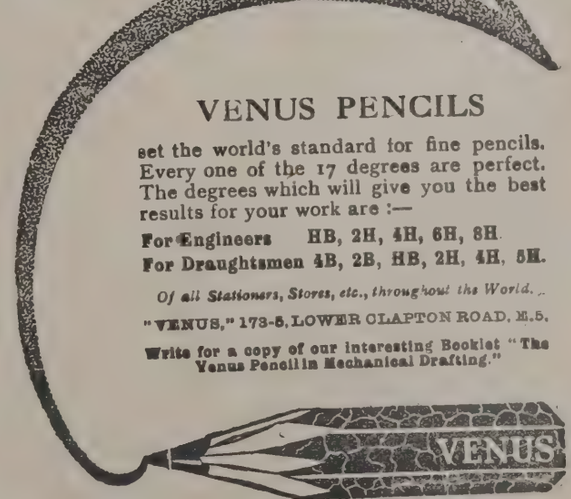
The WHEELER Pocket Height and Weather Indicator



For Aerial Passengers.

THIS instrument is designed for use of aviators. It indicates the exact height at which the Aeroplane is flying and is of great **interest and value to all who fly.** Furthermore it has the additional advantage of indicating the weather for general use—it is, in fact, a pocket barometer. The instrument is made in watch form, gilt or oxydized case, and supplied in solid leather outer case in a secure and convenient form for the coat pocket.

Two sizes: Diameter 1⅝" Diameter 2⅛" **Aircraft and motor accessory firms are invited to apply for terms.** *Can be supplied with luminous dials if desired*

courage, or devotion to duty performed whilst flying though not in active operations against the enemy, and may also be granted to individuals not belonging to Our Air Force (whether Naval, Military, or Civil) who render distinguished service to Aviation in actual flying.

Given at our Court at Balmoral this 27th day of August, in the tenth year of Our Reign and in the year of Our Lord One thousand nine hundred and nineteen.

W. S. Churchill, by His Majesty's Command.

PERSONAL NOTICES.

NAVAL.

Death.

EASTY.—Sub-Flt. Lieut. Walter Harry Easty, R.N.A.S., who was reported missing on April 22nd, 1918, while on an offensive patrol in the neighbourhood of Aveluy Wood, is now presumed dead. He was the only son of Walter and Lucy Sutton Easty, of 74, Kempe Road, London, N.W.6., and was 26 years of age.

Engagement.

PARRY—BUCKLEY.—The engagement is announced between Engineer Lieut.-Cmdr. Rey Griffith Parry, D.S.O., Royal Navy, acting Major, R.A.F., son of the late W. Griffith Parry, formerly of Grosvenor Lodge, Beckenham, and Belgrano, Buenos Aires, and Joan Brunner Buckley, younger daughter of Major T. W. Buckley, R.A.M.C., Clopton Manor, Thrapston, and of Mrs. Buckley, The Ridge House, St. George's Hill, Weybridge.

Marriage.

COMPSTON—BARCLAY.—On Nov. 25th, at St. Simon's Church, Chelsea, Flt. Lieut. Robert John Orton Compston, D.S.C., D.F.C., R.A.F., was married to Nina Mabel, only child of the late Capt. A. H. Barclay and adopted daughter of Lieut.-Col. H. F. Barclay, 34, Lennox Gardens, by the Rev. H. F. B. Compston, Vicar, Bredwardine, Hereford, Fellow of King's College, London (father of the bridegroom), assisted by the Rev. W. M. Selwyn, Vicar.

MILITARY.

Engagements.

CLARK—COATS.—The engagement has been announced between Capt. C. C. Clark, R.F.A. and R.A.F., youngest son of Mr. Henry Clark and the late Mrs. Clark, of 25, Adelaide Crescent, Brighton, and Katherine, eldest daughter of Mr. and Mrs. P. Herbert Coats, of Corsebar, Paisley.

NOEL—GAIRDNER.—The engagement is announced between Major M. W. Noel, A.F.C., the King's Regiment, attd. R.A.F., son of Colonel Noel, Stardens, Newent, Gloucestershire, and Edith, daughter of Mrs. Charles Gairdner, 88, Westbourne Terrace, Hyde Park.

Marriages.

BIRKETT—WELLS.—On Nov. 25th, at St. Stephen's Church, Ealing, Norman Wreford Birkett, late 6th Bn., The Buffs, and R.A.F., son of Mr. and Mrs. Louis Birkett, of Chislehurst, was married to Kathleen Wells, late W.R.A.F., daughter of Mr. C. W. Wells, of Ealing, by the Rev. H. M. Larner, Rector of Busbridge.

JENKINS—ROBERTSON.—On Nov. 26th, at St. Olaf's Church, Kirkwall, Lieut.-Col. F. Howard Jenkins, O.B.E., M.C. (late R.F.C. and R.A.F.), second son of the late J. H. Jenkins, M.R.C.S., L.R.C.P., of Lytham, Lancashire, was married to Harriet Fernelith, second daughter of Duncan J. Robertson, O.B.E., County Clerk of Orkney, by the Venerable Archdeacon Craven, D.D.

WEBB-BOWEN—HADLEY.—On Nov. 27th, at Christ Church, Chelsea, Air Commodore T. I. Webb-Bowen, R.A.F., late R.F.C., was married to Violet Louise Hadley, elder daughter of Mr. and Mrs. C. A. Hadley, of Johannesburg, S. Africa.

WILSON—ORR-EWING.—Capt. C. B. Wilson, late Xth Royal Hussars, and R.F.C., and Mrs. Hugh Orr-Ewing were married on Saturday, Nov. 22nd, and have left for the Continent.

Births.

GARROD.—On Nov. 13th, at 13, Gainsborough Gardens, Hampstead, to Evelyn, the wife of Squadron Leader A. G. R. Garrod, M.C., D.F.C., R.A.F.—a daughter.

HAWKINS.—On Nov. 24th, at Manor Farm, Sundridge, Kent, the wife of Gordon Hawkins, M.C., late Lieut., Border Regt. and R.A.F., of a son.

HUNTER.—On Nov. 14th, at Birnam, Castle Bromwich, the wife of Capt. A. Hunter, O.B.E., R.A.F. (late R.F.C.), of a son.

MOODY.—On Nov. 21st, at Simla, the wife of Major Francis Hyde Moody, M.C., R.A.F., of a daughter.

AIR FORCE.

Deaths.

BOURNE.—On Nov. 6th, Flying Officer Richard Balfour Bourne, R.A.F., died at Baldonnell Aerodrome, Co. Dublin, as the result of an aeroplane accident. He was 22 years of age, and was the elder son of Mr. and Mrs. Harry H. Bourne, of 82, Addison Way, N.W.4. Mr. Bourne had seen three years' service.

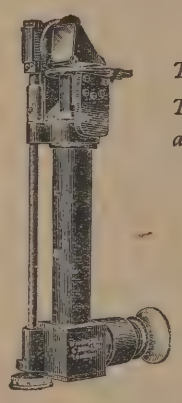
GIBB.—Mrs. J. P. Gibb, wife of Lieut. J. P. Gibb, late R.A.F., died on Nov. 10th at the Cottage Hospital, St. Andrew's.

KEYMER.—Capt. Basil Graham Homfray Keymer, D.F.C., Italian Croce di Guerra, R.A.F., who was killed on Oct. 24th in South Russia, was the eldest son of Rev. Basil N. Keymer, C.T.F., and Mrs. Keymer, of 1, Belvedere Road, Scarborough. He was 20 years of age.

Marriages.

HAMILTON—MITCHELL.—At St. Andrew's Church, Bath, on Dec. 2nd, Lieut. Wallace Ferrier Hamilton, R.A.F., youngest son of Mr. and Mrs. Claude Hamilton, Macedon, Australia, was married to Elsie, daughter of Mr. and Mrs. Ernest Mitchell, of 5, Park Street, Bath, by the Rev. Cecil Wilson, rector of Walcot.

LONG—TARRANT.—On Nov. 29th, at St. Stephen's Church, Gloucester Road, S.W., Flt. Lieut. Alexander James Long, R.A.F., only son of Mr. and Mrs. W. Alexander Long, of 140, Herne Hill, S.E.24, was married to Christine Amy, younger daughter of Mr. S. G. Tarrant, of Great Marlow, Bucks, and the late Mrs. Tarrant, of Tulse Hill, S.W., by the Vicar Lord Victor A. Seymour.



Births.

BLOUNT.—On Nov. 24th, at 28, Cheniston Gardens, W., the wife of Squadron Leader C. H. B. Blount, R.A.F., of a son.

LAIN.—On Nov. 18th, at 5, Cambridge Park, Bristol, to Dorothy, wife of Lieut. F. J. Lain, D.F.C., late R.A.F.—a son.

RICKCORD.—On Nov. 28th, at The Mount, Warlingham, Surrey, the wife of Wing-Commander Percival S. Rickcord, R.A.F., of a son.

The marriage arranged between the Rev. H. McCalman, M.C., R.A.F., and Miss Mildred Rosalie Neale will not take place.

ON THE BRITISH AIRCRAFT INDUSTRY OF TO-DAY.

AU SUJET DE L'INDUSTRIE DE L'AVIATION BRITANNIQUE.

With typically Gallic energy and initiative the French Aircraft Industry has organised a great Exposition of Aeronautic Matériel at the Grand Palais in Paris. This opens on December 19th, almost exactly eleven years since the first French Aero Show was held in the same magnificent building. The Exposition will remain open till the first week in January, and during the period of the Show naturally the aeronautical interest of the World will be centred on Paris.

One compliments our gallant Allies on their enterprise and, on behalf of all concerned with British Aeronautics, wishes them all the success which they deserve. France led the world in the construction and use of aeroplanes and airships from the beginning of aerial navigation until the outbreak of war. It is right and proper that she should lead in being the first nation to hold a great exhibition at the beginning of the era of Commercial Aeronautics.

British Aircraft Constructors are represented at the Exposition by some of the most famous firms in the Aircraft Industry, to wit the Aircraft Manufacturing Co., Ltd., Boulton and Paul, Ltd., the British and Colonial Aeroplane Co., Ltd. (more familiarly known as the Bristol Co.), Handley Page, Ltd., the Westland Aircraft Works, and Vickers, Ltd.: and on the machines shown by those firms are to be seen the products of some of our leading British manufacturers of engines, such as the Napier, Sunbeam, Rolls-Royce, Siddeley-B.H.P., and Cosmos, and of our leading makers of parts, accessories, and material. But there are very many more members of the British Aircraft Industry who are not represented.

It was the intention of the Society of British Aircraft Constructors to have had a big stand at the Exposition which would represent the British Aircraft Industry as a whole. Unfortunately, as the Society is not itself a manufacturer of aircraft, it was impossible, under the rules of the Exposition, for it to obtain a stand on the ground floor, which is reserved for actual manufacturers. And, as a stand in the Accessory Section would obviously not be consonant with the dignity and importance of the Society, the S.B.A.C. will not appear among the exhibitors.

Why the S.B.A.C. Issues.

Therefore it appears to the management of this paper to be a matter of duty to publish during the period of the Paris Aero Show as complete a review as possible of the British Aircraft Industry and its products, so that manufacturers of British aircraft, aero-engines, parts, accessories, and material may have an opportunity of placing before buyers of aircraft all over the world their claims to consideration.

Avec une énergie et une initiative bien gauloise, l'industrie d'Aviation française a organisé une grande exposition aéronautique au Grand Palais de Paris. Cette exposition s'ouvre le 19 décembre, a peu près exactement onze ans aprés l'ouverture du premier Salon d'aviation dans ce même grandiose batiment. L'Exposition restera ouverte jusqu'à la premiere semaine de Janvier, et naturellement pendant la durée de ce Salon, les intérêts aéronautiques du monde entier seront concentrés sur Paris.

Nous félicitons nos valiants Alliés de leur entreprise, et au nom de tous ceux que concerne l'Aviation britannique, nous leur souhaitons tout le succès qu'ils méritent.

La France a guidé le monde dans la construction et l'emploi d'avions depuis le commencement de l'ère aérienne jusqu'a la déclaration de la guerre. Il est juste qu'elle soit la première nation á ouvrir une exposition au commencement de l'ère aéronautique commerciale.

Les constructeurs d'avions britanniques sont représentés à l'exposition par certaines des plus fameuses firmes de l'industrie d'aviation, telles que—The Aircraft Manufacturing Co., Ltd., Boulton and Paul, Ltd., The British and Colonial Aeroplane Co., Ltd. (plus généralement connue sous le nom de The Bristol Co.), Handley Page, Ltd., The Westland Aircraft Works, et Vickers, Ltd., et les machines exposées par ces firmes représentent les produits de certains de nos fabricants britanniques de Moteurs, tels que Rolls-Royce, Napier, B.H.P., Sunbeam, et Cosmos, ainsi que de nos principaux fabricants d'accessoirs et de matériel. Mais il y a un grand nombre de Membres de l'Industrie d'Aviation Britannique qui ne sont pas représentés.

La "Society of British Aircraft Constructors" avait l'intention d'ouvrir dans l'exposition un département qui représenterait l'industrie d'aviation britannique en bloc. Malheureusement la dite Société n'étant pas elle même constructeurs d'avions, il lui a été impossible, vu les règlements de l'exposition, d'obtenir un département au rez-de-chaussée, qui est réserve aux fabricants mêmes. Et, comme il est évident qu'un comptoir dans la Section des Accessoirs n'eut pas été en rapport avec la dignité et l'importance de la Société, la S.B.A.C. ne prendra pas place parmi les exposants.

La Raison d'etre des editions S.B.A.C.

Pour cette raison la direction de ce journal le considère un devoir de publier pendant la durée du Salon d'Aéronautique, une revue aussi complète que possible de l'Industrie d'Aviation britannique et de ses produits, de façon que les Constructeurs d'avions britanniques, aéromoteurs, parties, accessoirs et matériel aient l'occasion de soumettre leurs produits aux acheteurs d'avions du monde entier.

The Paris Show will provide a great advertisement for the French Industry. It is the endeavour of THE AEROPLANE to provide as great an advertisement as possible for the British Industry, so that in the friendly rivalry of Commerce the British Aircraft Constructor may compete with his French competitor.

Foreign Buyers.

There is no doubt that many hundreds of thousands of visitors will enter the Grand Palais during the next three weeks. Many thousands of them will be passengers in aircraft during the next year or so. But only a few will be buyers of aircraft actually during the Show.

The real buyers of aircraft are the Military, Naval, and Postal authorities of various foreign nations, a certain number of business houses, and a certain number of new firms formed for the purpose of carrying passengers in aircraft, either for pleasure or for transport from place to place. Arrangements have been made that these Special British Aircraft Constructors' Issues of THE AEROPLANE shall reach such buyers in their own countries. Moreover, the attention of the Military, Naval, and Commercial attachés at the various embassies and legations in Paris and London will be similarly attracted to British aircraft by these issues. And those who wish to buy THE AEROPLANE in Paris will be able to do so.

Thus it is hoped to provide British Aircraft Constructors with an effective substitute for representation at the Paris Show.

The Industry's Opportunity.

All Members of the Society of British Aircraft Constructors and all Associate Members have been asked to supply information concerning their products for publication in these issues. And in order to be perfectly fair, firms who are not members of the S.B.A.C. have had the opportunity of supplying similar information, though, be it said, all aeroplane and engine firms of importance are in fact members of the S.B.A.C.

The information published in this and the two following issues is, therefore, what has been supplied by the firms themselves, merely edited or rewritten to make it uniform in style with the rest. If the information concerning some firms is meagre, it is because little information has been received. If the information concerning others is particularly comprehensive, it is because those firms have grasped the opportunity offered to them.

The amount of information thus obtained was too great to put into one issue of THE AEROPLANE, and so it has been divided among three issues. Moreover, it has been considered advisable to sustain the interest in the British Aircraft Industry throughout the duration of the Paris Show, rather than to cause one big splash and then let the interest subside. The information concerning the various firms has, therefore, been published in the order in which it has been received.

Deserters from the Industry.

Though it was to be expected that many firms who built aircraft or aircraft parts during the war would cease to do so when war ended, and though many small firms formed solely to make aircraft parts have naturally dissolved now that there is no more work for them to do, one confesses to a feeling of disappointment that so many big manufacturing concerns who made hundreds of thousands of pounds out of building aircraft during the war—in some cases one suspects millions of pounds—should now state that they have entirely lost interest in aircraft.

Le Salon de Paris constituera une grande réclame pour l'industrie française. THE AEROPLANE veut s'efforcer de produire une aussi grande réclame que possible pour l'industrie britannique, de sorte que dans la rivalité amicale du Commerce, le Constructeur d'avions britannique puisse rivaliser avec son concurrent français.

Acheteurs Etrangers.

Il est évident que des centaines de milliers de visiteurs se rendront au Grand Palais pendant les trois prochaines semaines. Des milliers d'entre-eux seront passagers en avions dans le courant de l'année. Mais un petit nombre seulement seront réellement acheteurs d'avions pendant la durée du Salon.

Les véritables acheteurs d'avions sont les autorités militaires, navales et postales de différentes nations étrangères, un certain nombre de maisons de commerce, et un certain nombre de nouvelles firmes formées dans le but de transporter les passagers par service aérien, soit pour leur plaisir soit comme moyen de communication Des arrangements spéciaux ont été pris pour que ces èditions spéciales de THE AEROPLANE parviennent aux dits acheteurs dans leur propre pays. De plus, l'attention des Attachés militaires, navals et commerciaux aux différentes ambassades et légations de Paris et de Londres, sera attirée de la même manière sur l'aviation britannique par ces éditions. THE AEROPLANE sera en vente a Paris pour tout ceux qui désirent se le procurer.

Ainsi, on espére donner de la sorte aux constructeurs d'avions britanniques un substituant efficace pour la représentation au Salon de Paris.

Une Occasion pour l'Industrie.

Tous les membres de la "Society of British Aircraft Constructors" et tous les Membres Associés ont été requis de fournir des informations concerant leurs produits, dans le but de les publier dans ces éditions. Et afin d'agir avec justice, les firmes qui ne sont pas membres de la S.B.A.C. ont eu l'occasion de fournir des informations similaires, bien que nous ferons remarquer que toutes les firmes importantes d'avions et de moteurs sont en fait membres de la S.B.A.C.

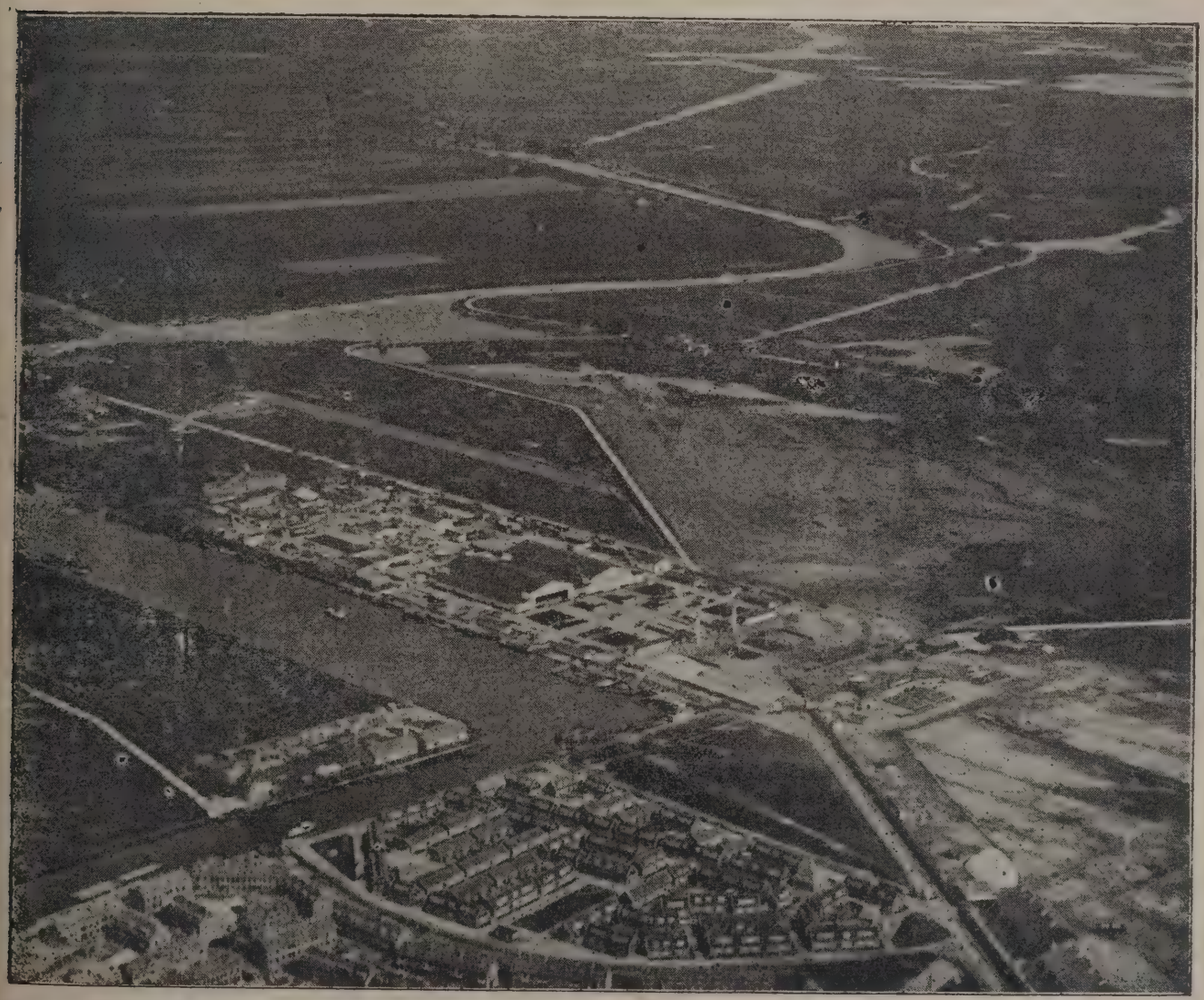
Les informations que nous publions dans cette édition et dans les deux suivantes sont celles qui nous ont été données par les firmes elles-mêmes, editées ou ré-écrites uniquement pour leur donner un style uniforme et en rapport avec le reste. Si les informations concernant certaines firmes paraissent moindres, c'est que peu d'informations nous ont été fournies. Si d'autre part les détails concernant certaines firmes sont plus étendus, c'est que ces firmes ont fait bon usage de l'occasion qui leur est offerte.

Le total des informations ainsi obtenues étant trop considérable pour paraitre dans une seule édition de THE AEROPLANE, il a été divisé en trois editions. De plus, il a été considéré plus avantageux de maintenir un intérêt dans l'industrie d'aviation britannique pendant toute la durée du Salon, que de produire un article sensationel et de laisser ensuite s'éteindre l'intérêt. En vue de cet arrangement les informations sont publiées dans l'ordre dans lequel elles ont été recues.

Deserteurs de l'Industrie.

On devait s'attendre a ce que bien des firmes constructeurs d'avions et de parties d'avions pendant la guerre cesserait de travailler après la guerre, et que des firmes moins importantes formées uniquement pour fabriquer des parties d'avions seraient naturellement forcées a dissolution. Cependant on ne peut s'empêcher d'exprimer un sentiment de désappointment lorsqu'on se rend compte que tant de fabriques qui ont réalisé des milliers de livres sterling par la construction d'avions pendant la guerre—dans certains cas il s'agit de millions—déclarent maintenant avoir perdu tout intérêt dans le sujet aviation.

Such firms made their money easily out of designs provided for them by the pioneers of aviation, who paid in blood and tears for the knowledge which produced those designs. Such firms spent their war profits, for which the lives of our aviators paid, in laying down elaborate machinery and setting up luxurious buildings for their staffs and workpeople who stayed away from the war, whereby they hope to make further huge profits in the future.



One would rather have expected that as a matter of honour such firms would have set aside a small part of their works and would have retained a small and efficient staff for experimental work on aircraft, so that they might thus help to improve the breed of British aircraft and so help to maintain the Command of the Air on which they, in common with the rest of the British Empire, must depend for their existence in the future.

Their desertion of the British Aircraft Industry is "not cricket." Indeed it is not even commercial common sense, for when, as will inevitably occur in due course, they want to get back into aircraft work when the next boom in aviation occurs, they will find their path beset with thorns. They will have lost their reputation as Aircraft Constructors, which they have acquired at some cost. They will have lost their experienced staffs. And they will have lost the good will of those who can do most to cause them to be accepted as aircraft producers worthy of consideration.

De telles firmes ont fait leur fortune avec facilité en employant les dessins que leur ont fournis les pioniers de l'aviation, dessins que ces derniers ont obtenus au prix de leur sang bien souvent. Ces mêmes firmes ont employé leurs profits de guerre, que nos aviateurs ont payés de leur vie, à ériger des machines perfectionnées et à construire des bâtiments luxueux pour leurs employés et leurs ouvriers qui n'ont pas pris part à la guerre, ces firmes espérant ainsi réaliser encore de grands bénéfices à l'avenir.

On se serait attendu à ce que de telles firmes le considèrent un point d'honneur de maintenir une petite partie de leurs installations et quelques employés efficaces pour faire des travaux d'expérimentation en aviation, aidant ainsi a maintenir la suprématie de l'air dont elles, comme le reste de l'Empire Britannique, dépendent pour leur existence future.

Leur désertion n'est pas honorable. Au fait elle ne prouve même pas un bon-sens commercial, car lorsqu'elles voudront reprendre leur place dans les travaux d'aviation ce qui se produira inévitablement, lors du prochain grand mouvement dans les forces de l'air, elles se trouveront face à face avec de grandes difficultés. Elles auront perdu leur réputation comme constructeurs d'avions qui doit leur avoir couté un certain capital. Elles auront perdu leur employés capables. Elles se seront aliéné le bon vouloir de ceux qui sont le mieux placés pour user de leur influence à les faire admettre comme constructeurs d'avions dignes de considération.

THE FIRST POST-BELLUM EXPOSITION.—The E.L.T.A. at Amsterdam as seen from above. The end of the aerodrome, with sheds, is seen in the right-hand bottom corner, and the Exhibition buildings are in the centre of the picture. The top of the picture gives a good idea of the country over which one has to fly to Holland.

The Constructors of British Aircraft.

The pre-war aeroplane firms courageously remain in the Aircraft Industry to a man. The Aircraft, Avro, Bristol, Blackburn, Caudron, Eastbourne, Grahame-White, Martinsyde, Handley Page, Short, Sopwith, Supermarine, and Vickers Companies are all keeping their works employed on aeroplanes, though all of them are taking up other work so as to make their factories pay their way till aviation again becomes a business proposition.

In addition to them the war has added other important firms to the aeroplane side of the Aircraft Industry. There are the Austin, Alliance, Beardmore, Boulton and Paul, British Aerial Transport, Central Aircraft, Fairey, Gosport Aircraft, Mann and Egerton, Nieuport and General, S. E. Saunders, and Westland Companies, all of whom took up aeroplane making during the war and intend to keep on making aeroplanes, either to order or purely experimentally, unless compelled to desist by force of circumstances. It is encouraging to find that there is faith in the future of aviation among so many firms of good standing.

Equally encouraging is the accession to the Aircraft Industry since the war of the new firm of George Parnall and Co., recently formed by Mr. George Parnall to carry on the aeroplane department of Parnall and Sons. Such practical demonstration of a belief in aviation deserves special recognition.

The Position of the British Aircraft Industry.

When the demand for commercial aircraft does arise, as it will do in due time, the British Aircraft Industry is probably better equipped to meet it than is any other.

The American Industry, though plentifully provided with men and machinery, is lamentably lacking in competent or experienced designers, and it will take years of experience before American aeroplanes can touch their British competitors for safety or efficiency.

The French Industry has certain designers of high genius, and its factories are well equipped. Also its workmen are clever and enthusiastic. But, if one judges by the aeroplanes produced in France during the war, the British Industry can provide several successful designs for every one of approximately equal performance in France. Moreover, for a good all-round level in reliability of construction and quality of workmanship the average British machine can beat the average French machine.

The German Industry is a dangerous competitor, for the German can produce cheaply and quickly. Also his aerodynamic designs are particularly good and his machines fly well. But his detail construction is frequently poor, and many of his machines are lacking in strength. Nevertheless, the German is very painstaking, and removes defects when he discovers them. Therefore the British Industry must guard carefully against German competition.

The Italian Industry is notable for the beauty of its design and its highly finished workmanship. But for the comparatively small number of constructors in Italy that country would be a very dangerous competitor. Even as it is, Italy will sell many aeroplanes and engines to other countries.

In spite of all this competition British workmanship and design is well able to bear comparison with that of any other country, and so the British Aircraft Industry should still hold the first place in the estimation of the world, provided that British Aircraft Constructors pursue a bold and active commercial policy.—C. G. G.

Les Constructeurs d'Avions Britanniques.

Les constructeurs d'avions d'avant guerre se maintiennent courageusement, sans exception, dans l'industrie de l'aviation. The Aircraft, Avro, Bristol, Blackburn, Caudron, Eastbourne, Grahame-White, Martinsyde, Handley Page, Short, Sopwith, Supermarine et Vickers toutes ces compagnies continuent à s'occuper de la fabrication d'aéroplanes, tout en entreprenant d'autres travaux pour continuer leur commerce en attendant que l'aviation devienne une fois de plus une affaire commerciale.

En plus des firmes citées ci-dessus, la guerre a donné d'autres firmes importantes a l'industrie de l'Air. Les Austin, Alliance, Beardmore, Boulton and Paul, British Aerial Transport, Central Aircraft, Fairey, Gosport Aircraft, Mann Egerton, Nieuport and General, S. E. Saunders, et Westland, toutes ces compagnies ont entrepris la construction d'avions pendant la guerre et se proposent de continuer à construire des avions, soit sur commande, soit comme expérimentation, à moins qu'elles ne soient forcées d'y renoncer par suite de circomstances imprévues. Il est encouragement de trouver une foi sincère dans l'avenir de l'aviation parmi tant de firmes si respectables.

Egalement encourageante est l'entrés dans l'industrie de l'aviation depuis la guerre, de la nouvelle firme George Parnall & Co. récemment formée par Mr. George Parnall pour continuer le département d'aéroplanes de Parnall & Sons. Une telle démonstration de foi dans l'aviation mérite une mention spéciale.

La Position de l'Industrie Britannique d'Aviation.

Lorsque se présentera la grande demande pour avions commerciaux, ce qui se fera en temps opportun, l'industrie d'aviation britannique sera probablement mieux équippée pour y répondre que ne l'est tout autre.

L'industrie américaine, bien que largement pourvue d'hommes et de machines, manquent lamentablement de dessinateurs compétents et expérimentés. Il faudra des années d'expérience à l'Amerique avant que ses avions puissent se comparer avec leurs concurrents anglais dans le domaine de la sureté et de l'efficacité.

L'industrie française possède certains dessinateurs de grand génie. Ses usines sont bien équippées. Ses ouvriers sont capables et enthusiastes. Mais, à en juger par les avions construits en France pendant la guerre, l'industrie britannique peut produire plusieurs dessins satisfaisants pour chaque dessin correspondant français. De plus une appareil anglaise moyenne le remporte en stabilité de construction et en qualité de main d'oeuvre sur une appareil française moyenne.

L'industrie allemande est un concurrent dangereux, car les allemands produisent facilement et à bon marché. De plus leurs dessins aérodynamiques sont spécialement bons et leurs machines volent bien. Mais le détail de leur construction est souvent faible et un grand nombre de leur machines manquent de résistance. Néanmoins l'Allemand est un travailleur acharné et corrige ses défauts lorsqu'il les découvre. Il est donc nécessaire que l'industrie britannique se pare prudemment contre la concurrence allemande.

L'industrie italienne est remarquable pour la beauté de ses dessins et le fini de sa main d'oeuvre. Sauf le nombre comparativement réduit de ses constructeurs, l'Italie serait un concurrent très dangereux. Tel que, l'Italie vendra bon nombre d'aéroplanes et de moteurs à d'autres pays.

En dépit de toute cette concurrence, la main d'oeuvre et le dessin britannique peut se mesurer avec ces mêmes facteurs dans d'autres pays, et l'industrie britannique de l'aviation peut maintenir le premier rang dans l'estime du monde entier, à condition que les constructeurs britanniques poursuivent une politique commerciale à la fois hardie et active.—C. G. G.

FLIGHT WITH ECONOMY

THE

Sopwith

Aviation and Engineering Co., Ltd.,

has designed and is building

Three New Types

TRANSPORT.—Single-engine, long distance, high-performance, weight-carrying utility aeroplane, carries six passengers or cargo.

GNU.—High-performance, enclosed cabin, three-seater.

DOVE.—Very fast sporting two-seater.

Appointments for Demonstration Flight and further particulars on application.

The Sopwith Aviation and Engineering Co., Ltd., originators of the high performance wide-speed-range biplane, has designed a larger number of types, which have been accepted and standardised by the British Government, than any other aircraft manufacturer. Its enormous works have been devoted exclusively to the production of its own machines, which have been also made in huge quantities by sub-contractors. Its designs have been made in great numbers by the French Government and also for the American Government, and have been also used by the Italian, Russian, Greek and Roumanian Forces.

THE FUTURE OF THE ROYAL AIR FORCE.

On December 13th, which may well be regarded as a lucky day by Service aviators of the future, there was issued a Memorandum by Air Marshal Sir Hugh Trenchard, Chief of the Air Staff, outlining the permanent organisation of the Royal Air Force. To the Memorandum is prefixed a note by Mr. Winston Churchill, Secretary of State for Air, stating that the scheme was prepared under his directions, and has been approved in principle by the Cabinet.

Neither the Memorandum nor the Note call for any particular comment. Both Mr. Churchill and Sir Hugh Trenchard have the welfare of the R.A.F. sincerely at heart, and there are no others so competent to lay down on sound foundations the organisation of our Flying Services. Nor are there any others in whom the officers and men of the R.A.F. have so much confidence. Consequently there will be a very general feeling throughout the Air Force that what is to be done is the best that can possibly be done with the money allowed for the purpose.

The proposal which will be of the greatest interest is that according to which the main portion of the Air Service will consist of an Independent Force, while a small part of the personnel will be specially trained for work with the Navy and a small part specially trained to work with the Army, "these two small portions probably becoming in the future an arm of the older Services."

Prophecies of the Past.

It will be remembered by all regular readers of The Aeroplane that this arrangement is precisely that which was advocated by this paper—and by this paper alone among the whole of the Press—when the single Air Force was first proposed during the agitations of 1916.

One has argued persistently that a Naval aviator is properly a Naval officer who flies and that an Army aviator is properly a soldier who flies, but that there are various uses for aeroplanes in war apart from the strategy of the Navy and Army, and so there is use for an Independent Air Force. Naturally, therefore, one feels gratified to find that the same view is held by Mr. Churchill and Sir Hugh Trenchard.

There is a solid satisfaction in seeing the official action of the two men who truly understand air war in its proper relation to war on sea and land putting into concrete form theories for which one has been abused and derided for the last four years by all the politicians and writers who fancy themselves as authorities on aviation, and by a number of R.A.F. officers who thought that they saw for themselves opportunities for advancement in a separate Air Service which were obviously not open to them in the Senior Services. Perhaps one may be forgiven once more for saying, not for the first time, "I told you so."

The Benefits of Separation.

The segregation of the Naval branch of the Air Service is wholly excellent. One hopes that ultimately it will remove from the Air Force some of those Naval officers who, having been proved useless to the Navy, managed to foist themselves onto the R.N.A.S. and so came into the R.A.F. automatically. There is now an unexpected opportunity of returning them with thanks to the Navy, where they will doubtless again find themselves, in the expressive Naval phrase, "on the beach."

When once they have gone, the R.A.F. will be able to organise its administration and its staff-work on proper lines, and may become an efficient service like the Army. The purely Army side of the Air Service will be the better for being an integral part of the Army, and in friendly competition with this new R.F.C. (one hopes to see the old honourable name and badges revived) the Royal Air Force will develop into a worthy part of the King's Armed Forces.—C. G. G.

THE MEMORANDUM.

Sir Hugh Trenchard's Memorandum reads as follows :—

AN OUTLINE OF THE SCHEME FOR THE PERMANENT ORGANISATION OF THE ROYAL AIR FORCE.

Note by the Secretary of State for Air.

The scheme outlined in the following memorandum on the permanent organisation of the Royal Air Force has been prepared during the course of the present year under my directions by the Chief of the Air Staff, and has in principle received the approval of the Cabinet.

The many complications of the Air Service and its intricate technical organisation are not perhaps fully appreciated, even by those who take a general interest in the subject. It therefore appears desirable to lay this memorandum in both Houses of Parliament, in order that they may understand the character of the problem and the complications that are being faced.

It should be added that the financial provision which the Cabinet have approved as governing the scale of the Royal Air Force during the next few years is approximately 15 million pounds per annum. It is upon this basis that this scheme has been prepared, and it is upon this basis that it is hoped the Estimates of next year will, apart from any extraordinary expenditure which the military situation may render necessary, be framed. Winston S. Churchill.

Dec. 11th, 1919.

MEMORANDUM BY THE CHIEF OF THE AIR STAFF.

1. **The Problem confronting Us.**—The problem of forming the Royal Air Force on a peace basis differs in many essentials from that which confronts the older services. The Royal Air Force was formed by the amalgamation of the Royal Flying Corps and the Royal Naval Air Service, and one may say, broadly speaking, that the whole Service was practically a war creation on a temporary basis, without any possibility of taking into account that it was going to remain on a permanent basis. The personnel with few exceptions was enlisted for the duration of the war, and put through an intensive but necessarily hurried course of training. Material was created in vast quantities, but rapid development often rendered it obsolete almost before it had reached the stage of bulk production. The accommodation provided had perforce to be of an entirely temporary character. The force may in fact be compared to the prophet Jonah's gourd. The necessities of war created it in a night, but the economies of peace have to a large extent caused it to wither in a day, and we are now faced with the necessity of replacing it with a plant of deeper root. As in nature, however, decay fosters growth, and the new plant has a fruitful soil from which to spring.

The principle to be kept in mind in forming the framework of the Air Service is that in the future the main portion of it will consist of an Independent Force, together with Service personnel required in carrying out Aeronautical Research.

In addition there will be a small part of it specially trained for work with the Navy, and a small part specially trained for work with the Army, these two small portions probably becoming, in the future, an arm of the older services.

It may be that the main portion, the Independent Air Force, will grow larger and larger, and become more and more the predominating factor in all types of warfare.

2. **Governing Principles.**—In planning the formation of the peace Royal Air Force it has been assumed that no need will arise for some years at least for anything in the nature of general mobilisation. It has been possible therefore to concentrate attention on providing for the needs of the moment as far as they can be foreseen and on laying the foundations of a highly-trained and efficient force which, though not capable of expansion in its present form, can be made so without any drastic alteration should necessity arise in years to come. Broadly speaking, the principle has been to reduce service squadrons to the minimum considered essential for our garrisons overseas, with a very small number in the United Kingdom as a reserve, and to concentrate the whole of the remainder of our resources on perfecting the training of officers and men.

It is intended to preserve the numbers of some of the great squadrons who have made names for themselves during the war, in permanent service units with definite identity, which will be the homes of the officers belonging to them, and will have the traditions of the war to look back upon.

There will be found in the Appendix a statement showing detailed particulars of squadrons, stations, schools, depots, &c., which it is hoped to provide in the next three years at home and abroad. It will be understood that this programme is to be regarded as provisional only.

3. **Service Units.**—It is proposed to provide 8 squadrons for India and 3 for Mesopotamia, with the necessary facilities for repair. As regards India this is in accordance with a proposal put forward from India and now under consideration by the Government of India. The cost of the units in India will fall on the Government of India on exactly the same basis as in the case of the military garrison. Recent events have shown the value of aircraft in dealing with frontier troubles, and it is not perhaps too much to hope that before long it may prove possible to regard the Royal Air Force units not as an addition to the military garrison but as a substitute for part of it. One great advantage of aircraft in the class of warfare approximating to police work is their power of acting at once. Aircraft can visit the scene of incipient unrest within a comparatively few hours of the receipt of news. To organise a military expedition even on a small scale takes time, and delay may result in the trouble spreading. The cost is also much greater, and very many more lives are involved.

In Egypt it is proposed to station 7 service squadrons. Under existing conditions in that country aircraft are a most valuable means of communication. Distances are long and ground communication confined to a few main routes. On the other hand the country and the climate are both ideal for flying. From a wider aspect Egypt is the Clapham Junction of the air between east and west, and is situated within comparatively easy reach of the most probable centres of unrest, and this added to its natural advantages for aviation, makes it the obvious locality for a small Royal Air Force reserve.

As regards our Naval bases and important coaling stations overseas, future developments will almost certainly lead to the necessity of providing aircraft as part of their garrisons, but in the majority of cases the need of this is not urgent under existing conditions, and for the present it is only proposed to station a small seaplane unit at Malta, and a similar unit in the Eastern Mediterranean, probably at Alexandria.

The Service squadrons quartered in the United Kingdom apart from those for co-operation with the Army and Navy will eventually number four, but not more than two of these squadrons will be formed in the next financial year. These squadrons will be employed on communication and similar duties in peace and will form a small reserve in case of need. For co-operation with the Army it is proposed to provide eventually squadrons on the basis of a flight per division for work with the troops at all stages of their training, and in addition one or more squadrons for co-operation with the artillery both during their winter training and their annual gun practice. During the next financial year it is proposed to form two squadrons in all, one at Farnborough for co-operation with the troops at Aldershot and Salisbury, and the second at Stonehenge for work with the artillery. Small units will, if necessary, be provided in addition for co-operation with the Garrison Artillery School at Golden Hill, and the Anti-aircraft School when formed.

There remain the Service squadrons for co-operation with the Fleet. It is proposed eventually to provide at home three Aeroplane squadrons and two Seaplane squadrons. To secure economy and to give the units a corporate existence and ample facilities for practice it has been decided that aeroplanes will no longer be carried normally in capital ships as was done during the war, but will only be embarked when required to take part in Fleet exercises. The Aeroplane squadrons will consist of one reconnaissance and spotting squadron, one squadron of fighter machines and one of torpedo-carrying machines. The two former will be based on the Firth of Forth where ample facilities exist for practice and for the embarkation and disembarkation of machines, a most important point. The torpedo-carrying squadron will be located at Gosport, the most suitable station for torpedo work, and it is proposed to provide a small experimental unit at the same station in order to develop fully this form of co-operation with the Navy, which is of primary importance. Of these three squadrons it is only proposed to provide one, the reconnaissance squadron, at full strength in the ensuing financial year. This is necessary in order to study and perfect the system of observation of artillery fire which from various causes was not so highly developed on the naval side as on the land side during the war. The torpedo squadron will be maintained at sufficient strength to carry on the essential research work while the fighting squadron will be formed in the first instance at a strength of one flight only. In addition, the Admiralty propose to keep two aircraft carriers in commission. One of these will be equipped with seaplanes for service abroad, while the other will remain at home and be used primarily for training and experimental purposes and ready if necessary to embark a flight of torpedo or other machines.

The provision of these two carriers is of the first importance since we must look forward to the time, as suitable machines develop, when fleets will so to speak take their aerodromes with them in the shape of a carrier, and the carriage of aircraft on capital ships with its attendant disadvantages and dangers will be a thing of the past.

Of the two seaplane squadrons, it is only proposed at present to form one flight only. The seaplane has obvious advantages over the aeroplane for long distance work over water, and a time may probably come when all work in co-operation with the Navy will be done by this class of machine. For this reason, if for no other, it is essential to have a few such units.

The lighter-than-air service is a difficult problem. The cost of providing such a service on a large scale in peace is prohibitive, and the use of airships in war may be said to be still in the experimental stage. It is proposed therefore to keep one airship station only, namely Howden, where sufficient accommodation exists for two rigid and a few smaller ships, and to retain as a commencement one rigid and two non-rigids only. This will allow research work and development to continue, and the use of airships in peace and war to be further studied.

4. **Reserves.**—Although modilisation on a large scale is not taken into account, it is very necessary to provide a small reserve to meet any sudden call in the case of a small war anywhere in the Empire. For the next year or two there will, doubtless, be no difficulty in enrolling as many ex-officers and men as are likely to be required, and all that will be necessary will be to provide facilities for their training and practice flying.

It is intended, however, if possible, in addition to lay the foundation of a future Air Force on a territorial basis. No detailed scheme has yet been worked out, but it is probable that the eventual organisation will provide for training both on a unit and on an individual basis. It is hoped that the manufacturing and commercial firms will assist by forming units of their employees. In addition there will doubtless be many individuals who will be glad to train themselves voluntarily with a certain amount of State assistance, and to undertake to serve, either overseas or at home, if called upon to do so. It is not intended to embark on the formation of any units during the next financial year, but it is proposed to commence with the training of individuals in the populous centres. This training will be carried out at the flying training wings whose functions will be described below.

5. **Extreme Importance of Training.**—We now come to that on which the whole future of the Royal Air Force depends, namely, the training of its officers and men. The present need is not, under existing conditions, the creation of the full number of squadrons we may eventually require to meet strategical needs, but it is first and foremost the making of a sound framework on which to build a service, which while giving us now the few essential service squadrons, adequately trained and equipped, will be capable of producing whatever time may show to be necessary in future.

Before explaining our proposals in details it is necessary to lay down certain postulates.

Firstly, to make an Air Force worthy of the name, we must create an Air Force spirit, or rather foster this spirit which undoubtedly existed in a high degree during the war, by every means in our power. Suggestions have been made that we should rely on the older services to train our cadets and Staff officers. To do so would make the creation of an Air Force spirit an impossibility apart from the practical objection, among others, that the existing naval and military cadet and staff colleges are not provided with aerodromes or situated in localities in any way suited for flying training.

Secondly, we must use every endeavour to eliminate flying accidents, both during training and subsequently. This end can only be secured by ensuring that the training of our mechanics in the multiplicity of trades necessitated by a highly technical service, is as thorough as it can be made. The best way to do this is to enlist the bulk of our skilled ranks as boys and train them ourselves This has the added advantage that it will undoubtedly foster the Air Force spirit on which so much depends.

Thirdly, it is not sufficient to make the Air Force officer a chauffeur and nothing more.

Technical experts are required for the development of the science of aeronautics, still in its infancy. Navigation, meteorology, photography and wireless are primary necessities if the Air Force is to be more than a means of conveyance, and the first two are requisite for safety, even on the chauffeur basis.

6. **Training of Officers.**—It is now necessary to sketch very briefly the training proposed for both officers and men.

THE FAIREY AVIATION CO., LTD.,

Contractors to the Admiralty, War Office and Air Ministry.

Head Office, HAYES, MIDDLESEX.
London Office, 175, PICCADILLY, W.1.
Works, Hayes, Middlesex, and Hamble, near Southampton.

Designers and manufacturers of Seaplanes, Flying Boats and Aeroplanes.

Patentees of the Fairey Patent Variable Camber Gear for Aircraft.

Sole Licensees of the Linton Hope Patent Hull for Flying Boats.

Designers, by special request of the British Government, of the "Atalanta" type Flying Boat, the largest of its kind constructed.

The following types of Fairey Seaplanes designed for the British Government have been put into production for Service use:—Fairey Campania, Hamble Baby—type IIIA, type IIIB, type IIIC.

Telephone—19 Hayes, Middlesex.

Telegrams—"Airily, Hayes, Middlesex."
Code—A.B.C. 5th Edition.

Owing to the necessity for a large number of officers in the junior ranks, and to the comparative paucity of higher appointments, it is not possible to offer a career to all. Consequently some 50 per cent. only of the officers have been granted permanent commissions, the remainder being obtained on short service commissions or by the seconding of officers from the Army and Navy. Great importance attaches to the last class since an interchange of officers is bound to make for closer and more intelligent co-operation between the services.

The channels of entry for permanently commissioned officers will be through the Cadet College, from the Universities and from the ranks. The cadet college will be the main channel. The course will last two years, during which the cadets will be given a thorough grounding in the theoretical and practical sides of their profession, and will in addition learn to fly the approved training machine, at present the Avro. The college is to open at Cranwell in Lincolnshire early next year, an ideal place for the purpose, with a large and excellent aerodrome and perfect flying surroundings. It will be necessary to accommodate the college temporarily in huts erected during the war, but every endeavour has been made to render these as suitable as possible, and it is proposed to erect a permanent college in the near future. On leaving the college, cadets will be commissioned, and will undergo a short course in air pilotage and practical cross-country flying at Andover. This school will probably not be required before early in 1921. As soon as the cadets have passed this course they will be posted to a service squadron, as it is most important that they should join a unit which they will regard as their home, as the sailor does his ship, or the soldier his regiment, as early as possible. Subsequently they can undergo a course of gunnery, without which no flying officer can be regarded as a service pilot. The gunnery school will be established at Eastchurch, but as the bulk of our present pilots have war experience, will not be required in the next financial year. After 5 years' service, officers will be required to select the particular technical subject they will make their special study during their subsequent career, e.g., navigation, engines, wireless. Short and long courses will be provided in these subjects in order to cater both for the officer who wishes to continue primarily as a flying officer with a working knowledge of one or more technical subjects, and for those who wish to become really expert in a particular branch. Technical knowledge will, inter alia, qualify an officer for selection for high command.

The career of officers commissioned from the Universities or from the ranks—except in the case of boy mechanics receiving commissions, whose case will be dealt with later—will be identical with that of those from the cadet college, except that they will be taught to fly at a flying training wing before joining their squadrons. Short service and seconded officers will be taught to fly at training wings and will attend a course of aerial gunnery and probably one of air pilotage. In view of their short service, it is not proposed, save in special cases, to send them through the advanced technical courses. These officers will be eligible for promotion during their service in exactly the same way as the permanent officers. The technical schools required at once are those dealing with navigation, wireless, photography and engineering. Aerial navigation is practically a new science. An attempt has been made during the current year to work out the theoretical principles in practice at Andover, and considerable progress has been made, but it is obvious that the chief need of aerial navigation will arise when flying over the sea, where the map is of no service, and it is consequently proposed to reopen this school at Calshot in the spring of next year.

Schools of wireless and photography are now in existence at Flowerdown, near Winchester, and at Farnborough respectively, while it is proposed to commence an engineering course, at a suitable station, shortly after Christmas.

For the training of University candidates, short service and seconded officers and officers of the reserve or Territorial Force, it is estimated that seven training wings would eventually be required.

In view, however, of the fact that the short service list has been filled by officers who have already been trained as pilots during the war, it is only proposed to form two of these on a reduced basis during the next financial year to deal with the training of University candidates, a small number of reserve officers and of certain officers granted permanent commissions, with the proviso that they must learn to fly within 12 months. In view of the exceptional facilities for training in Egypt, it is proposed to locate, at least, one of the training wings, together with branch schools of gunnery and air pilotage in that country, but whether it will be convenient to do so next year cannot yet be definitely foreseen.

One other most important school in connection with the training of the officer is essential, and it will probably be necessary to start it on a small scale in 1920. This is a school for flying instructors. The first school of this kind was started during the war at Gosport, and it is hardly too much to say that it revolutionised the art of flying. The science of flight was carefully analysed and the analysis practically applied to the problem of tuition with remarkable results. It is essential in future that all instructors in training wings and all officers of or above the rank of flight commander in service squadrons should have passed through this course. A liberal amount of dual control with a qualified instructor is one of the chief safeguards against the faulty flying which is the cause of the majority of accidents.

Although it is not proposed to open it during the next financial year, an Air Force Staff College must be formed as soon as possible. It is intended to establish this at Halton in the house of the late Mr. Alfred Rothschild, purchased by the Government at his death with the whole estate. The house and its surroundings are eminently suited for the purpose, and there is an aerodrome within a quarter of a mile.

7. **Training of Men.**—The most difficult problem of all in the formation of this force is the training of the men. Demobilisation has removed most of our best mechanics, and the efficiency of the squadrons to be formed depends on the most thorough instruction of those who are to take their place. It has, therefore, been decided to enlist the bulk of those belonging to long apprenticeship trades as boys, who will undergo a course of three years' training before being passed into the ranks. With a preliminary training of the nature contemplated and the practice of their trade during their subsequent service, it is confidently anticipated that these mechanics on passing to civil life will have no difficulty in securing recognition as skilled tradesmen. This is an important consideration since any tendency for the Air Force to be regarded as a blind alley occupation, would be fatal. The training of all these boys will eventually be carried out at Halton Park, where ample and well-equipped technical shops are already in existence. Pending the erection of permanent barracks to replace wooden war-time huts, use will also be made of Cranwell, in Lincolnshire. It has been necessary to speed up the training of some 5,000 boys enlisted during, and shortly after the war, and the residue of these, some 3,000, will complete their training, at Halton. A scheme has been drawn out for the future enlistment of boys by means of a competitive examination, and local education authorities have been circularised with a view to their nominating suitable boys to sit for the examination. By this means it is hoped to secure a really high standard. The first entry under this scheme will take place early in 1920, and the boys will commence their training at Cranwell and will be moved to Halton as soon as the permanent accommodation is ready.

The boys, on successfully passing their final examination, will be graded as leading aircraftsmen, and a certain number will be specially selected for a further course of training, at the end of which they will either be granted commissions, or promoted to corporal. Those granted commissions will join the cadet college.

It is intended to enlist the remainder of the mechanics, of whom more than half will belong to short apprenticeship trades as men, and these will undergo 12 months' training at Cranwell as soon as the boys have moved to Halton. Pending the move, it is proposed to carry out the training of these men at Eastchurch, which, as has already been said, will not be required in its eventual capacity as a gunnery school for another 12 months at least.

Non-technical men will be given a short course of recruit training at the depot at Uxbridge.

8. **Higher Organisation at Home.**—As regards higher organisation in the United Kingdom, all units working with the Navy have lately been formed into one command known as the Coastal Area Royal Air Force. The two remaining commands, now known as the Southern and Northern Areas, will, early in 1920, be amalgamated into one command to be known as the Inland Area. This cannot be done earlier owing to the very large amount of work entailed in closing up surplus stations, demobilising surplus personnel and generally clearing up the after effects of the war.

9. **Depots.**—Each of the two Areas in the United Kingdom will have its repair depot, at Henlow for the Inland Area, and at Donnibristle, near Rosyth, for the Coastal Area. During the next financial year it will be necessary to retain three of the existing stores depots, but it may prove possible at a later date to reduce the number to two, though this is by no means certain. It is hoped that eventually arrangements will be made for all Royal Air Force mechanical transport to be repaired at Slough, but in view of the arrears of work it will be necessary to retain for the present our own repair depot at Shrewsbury. Each overseas theatre will have a combined repair and store depot of a size suitable to the number of squadrons based upon it.

BY APPOINTMENT
JEWELLERS TO HIS MAJESTY THE KING.

Christmas Jewellery.

THE Goldsmiths and Silversmiths Company's Christmas Jewellery is of the highest quality and at the moderate prices offered represents a value unobtainable elsewhere. Country Customers can rely upon their orders receiving the same careful attention as would be given if a personal visit were made.

A selection can be sent for approval if desired, post paid, or a Catalogue of Christmas Gifts will be posted free to any address upon application.

WARNING.
The Goldsmiths and Silversmiths Company have no branch establishment in Regent Street, Oxford Street, or elsewhere in London—only one address, 112, Regent Street, London, W.1.

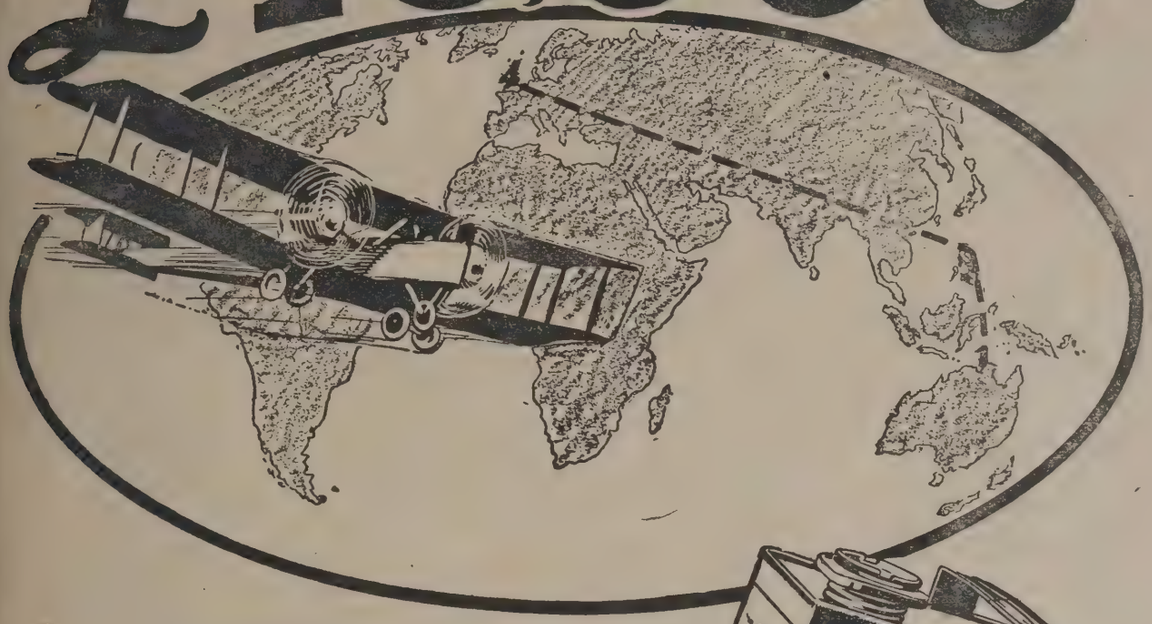
10. **Necessity for Large Capital Outlay on Accommodation.**—From the above outline of our proposals it will be seen that every endeavour is being made to reduce expenditure on personnel during 1920-1921 to the minimum absolutely essential to create the framework of our future Air Force. This is necessary, if for no other reason, owing to the peculiar position in which the Royal Air Force is placed as regards permanent accommodation. Though some of the wartime buildings can be made to serve for a year or two in their present state, the Air Force does not possess one single permanent barracks, and a large capital outlay on the provision of new buildings and the adaptation of the most suitable of the temporary buildings is inevitable during the first few years. This will be balanced to a certain extent during the next two years by the small requirements in technical equipments due to the large stock remaining over from the war. The principle followed has therefore been to excise rigid economy at the outset over personnel and technical equipment in order to free as large a part as possible of the total sum provided towards the provision of barracks. As time goes on, the building services will absorb less, while the cost of technical equipment, and, to a lesser extent, of personnel, will increase, until eventually the works vote will be little in excess of the cost of maintenance.



It must be recognised, however, that the total cost of building will be large. The boys' barracks at Halton, for instance, with the necessary accessory buildings and the cadet college will no doubt be a heavy item. These are undoubtedly the two most expensive services, but the accommodation for personnel at the majority of our stations will have to be rebuilt or adapted at considerable cost. The outlay must, however, be faced, and it is undoubtedly wise to undertake the bulk of the work in the first few years, while the expense of other services can be kept down.

APPENDIX.

	Existing or to be formed in 1920-21.	Increase during 1921-22 to.	Increase during 1922-23 to.
I.—UNITED KINGDOM.			
Striking Force	2 Squadrons.	4 Squadrons.	No increase.
Training Wings	2 Wings each of 3 Squadrons.	5 Wings.	6 Wings.
Co-operation with Army Divisions.	1 Squadron.	2 Squadrons.	No increase.
Co-operation with Fleet (Home Waters).	1 Squadron Reconnaissance and Artillery machines.	No increase.	No increase
	1 Flight Ships' fighters.	1 Squadron Ships' fighters.	No increase.
	½ Squadron Torpedo machines.	1 Squadron Torpedo machines.	No increase
	1 Flight Flying Boats	1 Squadron Flying Boats.	2 Squadrons Flying Boats.
	1 Flight Float Seaplanes.	No increase.	No increase.
Communication Squadron	1 Squadron.	No increase.	No increase.
Experimental Stations	4 Stations for Aeroplanes, Seaplanes, Torpedo machines and Wireless respectively.	4 Stations as before and trial ground for bombs and machine guns in addition.	No increase
Schools and Training Centres..	Cadet College.	As for 1920-21, and in addition.	As for 1921-22, substituting Staff College for Administrative and Technical School for Officers, and in addition
	Navigation School.	School of Air Pilotage.	Flying Officers' Training College (for the preliminary training of direct entry Officers).
	Flying Instructors' School.	School of Gunnery.	
	Administrative and Technical School for Officers.	(N.B.—The majority of the Schools will be on a reduced basis in 1920-21, and will gradually increase to full strength in the two succeeding years.)	
	Wireless and Electrical Training School.		
	School of Photography.		
	School of Co-operation with Navy.

11. **Research.**—One matter of supreme importance has not yet been mentioned, namely, the provision to be made for research. The departments of Supply and Research are now being transferred from the Ministry of Munitions to the Air Ministry, and a portion of the experimental establishments are a charge on the Air Force votes. Steady and uninterrupted progress in research is vital to the efficiency of the Air Force, and to the development of aviation generally, and on it depends both the elimination of accidents and the retention of the leading position we have established at such heavy cost during the war. The existing establishments must therefore be retained during the ensuing financial year at a sufficient strength to ensure that urgent work shall continue. Some of the work which was urgent under war conditions can, however, now be postponed until progress with the building programme liberates more money for other purposes. The principal aeroplane research establishments are at Farnborough, Biggin Hill, Martlesham Heath, and Grain, while airships' research will be undertaken at Cardington and Howden.

12. **Civil Aviation.**—No allusion has been made to civil aviation in this paper, which has been confined to the Service aspect of the question.

H. M. TRENCHARD,
Chief of the Air Staff.

Air Ministry, Nov. 25th, 1919.

THE DEATH OF MR. JOSE WEISS.

It is with very deep regret that one announces the death of Mr. José Weiss, one of the pioneers of British Aviation. The news comes too late for an adequate account of Mr. Weiss's work to be given in this paper to-day, but one hopes to deal with his achievements more fully next week.

Mr. Weiss was one of the first exponents of inherent stability, and his experiments of 1908-9 were of great value to those who at a later date produced satisfactory aeroplanes. For the past twelve months Mr. Weiss has suffered from ill-health, and he passed over on Thursday last, December 11th.

A McCUDDEN MEMORIAL.

Some months ago a few friends of the late Major J. T. B. McCudden, V.C., and of his two brothers, William McCudden and Anthony McCudden, who were also killed while flying in the King's service, decided to get together a small fund with which to erect a memorial to the three brothers. It is the wish of their father and mother that this memorial shall be set up at Chatham, where all three were born.

The following subscriptions have already been received :—

Lord Weir of Eastwood, £10 10s.; Air Marshal Sir H. M. Trenchard, Bart., K.C.B., D.S.O., £2 2s.; Major-Gen. Sir F. M. Sykes, G.B.E., K.C.B., C.M.G., £2 2s.; Air Commodore H. R. M. Brooke-Popham, C.B., C.M.G., D.S.O., A.F.C., £5; Air Commodore P. W. Game, C.B., D.S.O., £1 1s.; Air Commodore C. A. H. Longcroft, C.M.G., D.S.O., A.F.C., £1 1s.; Wing Comdr. R. G. Blomfield, D.S.O., £4 4s.; Wing Comdr. L. W. Rees, V.C., O.B.E., M.C., A.F.C., £2 2s; "Five Years in the R.F.C.," £3 3s.; the Sopwith Aviation Co., Ltd., £2 2s.; Martinsyde, Ltd., £2 2s.; C. G. Grey, £2 2s.; Major C. C. Turner, £2 2s.; Stanley Spooner, £2 2s.; Capt. P. D. Acland, £2 2s.; Major E. L. Gilchrist, M.C., D.F.C., £2 2s.; Mrs. Rhys Davids, £2 2s.; Capt. G. J. C. Maxwell, M.C., D.F.C., A.F.C., £2 2s.; Capt. T. B. Marson, £2 2s.; Capt. Doyle, D.F.C., £2 2s.; Capt. Leighton, M.C., £2 2s.; Capt. G. W. Robarts, M.C., £1 1s. Total, £57 4s.

This amount is in itself sufficient for the proposed memorial at Chatham, but it is thought by those responsible for the fund that many more friends of the McCudden family would like to subscribe, and that very probably a number of admirers of the work of these young men who died for King and country would like to add to the amount, though they did not know them personally.

Also, as far as is known, there is no other instance of three brothers being killed as pilots, and so there is good reason why all those who are concerned with flying should contribute to a memorial to a family which has made a greater sacrifice than any other in winning for this country the Command of the Air.

If the response to this appeal is as great as it should be, it is proposed that, after erecting the memorial at Chatham, the Balance of the fund shall be devoted to endowing another form of memorial which will be of direct use to those who fly in years to come. This might take the form of a McCudden Memorial Bed at the R.A.F. Hospital, or a McCudden Memorial Scholarship in Aeronautics at one of the Universities, according to the wishes of the majority of the subscribers.

It is hoped that a large number of the officers who served with either of the three McCudden brothers, and a still larger number of those who know them only by reason of their deeds, will subscribe to the fund. Subscriptions, which are limited to a maximum of £2 2s., should be sent to Capt. Gerald C. Maxwell, M.C., D.F.C., at Room 663, Air Ministry, Kingsway, W.C.2.

THE SERVICE ESTIMATES.

The Navy, Army, and Air Force Estimates, each of which has been presented to the House of Commons during the past week, will be dealt with in detail in the next issue of THE AEROPLANE.

TOUCHÉ.

One is always pleased to acknowledge a hit by those whom one has criticised, or, perhaps, one should rather say, by those whose legs one has pulled. Last week one remarked that, despite the official statement that technical reports were being issued by the Air Ministry, no "technical information" had been received from the Air Ministry's Department of Information. In the "Aeronautical Engineering" Supplement of the same issue of this paper there appeared an illustrated article on navigating instruments, which article, illustrations and all, had been issued by the Department of Information.

"A hit. A palpable hit!" undoubtedly. But—the statement that no technical information had been received appeared in the third instalment of a long article which was written three weeks before, and the article on instruments was received from the Air Ministry a week before it appeared in print, so that the statement was strictly true when it was written. Also, the highly scientific technician who edits "Aeronautical Engineering," informs one that the article on navigating instruments, though very interesting, was, in fact, of a commercial nature, and not at all technical, and as one is oneself "a child in these matters" one is forced to accept his diagnosis.

THE ROYAL AERO CLUB AND FLYING COMPETITIONS.

Apropos the letter which appeared in THE AEROPLANE recently, suggesting that the Committee of the Royal Aero Club might at least turn over in its sleep and take a momentary interest in the sport of aviation by deciding upon some form of flying competition for next year, a correspondent writes: "A series of flying competitions next year would in all probability assist commercial aviation a little more than a golf tournament among the members, although, of course, in that case the club does get a good deal of publicity through the 'Daily Mirror.'"

One is entirely in sympathy with this remark. If the committee of the club would think a little less about golf and bridge and a little more about the sport of aviation (for the regulation of which the Royal Aero Club is supposed to exist) it might be of actual value to the development of civil aviation.

A NEW SPEED RECORD CLAIM.

At Villacoublay, on Dec. 15th, M. Sadi Lecointe, on a Spad biplane (Hispano-Suiza engine), flew over a measured kilometre under official observation at a speed of 307 kilo. 225 metres an hour (approximately 191 miles an hour). No further details are at present available It is not stated whether or not this speed is the mean of two flights made in opposite directions, as is necessary in the case of a claim for a record.

THE FLIGHT TO AUSTRALIA

AND

"K.L.G." SPARKING PLUGS

Another Milestone in Flying History.

Capt. Ross Smith on the Vickers-Vimy-Rolls machine which has accomplished this Epic flight, infinitely the most remarkable sustained effort in the history of Aviation, used **"K.L.G." SPARKING PLUGS.**

The reason for his choice was, doubtless, that the plugs which were used by Sir John Alcock for his Trans-Atlantic flight (Vickers-Vimy-Rolls machine), by Mr. H. Hawker in his glorious failure over the same course (Sopwith-Rolls), and by the R.34 for her double trip to America and back (Sunbeam Coatalen), inspired him with absolute confidence.

"All were available. K.L.G. were chosen."

In every case where absolute reliability is essential the greatest judges entrust their lives to "K.L.G." Sparking Plugs.

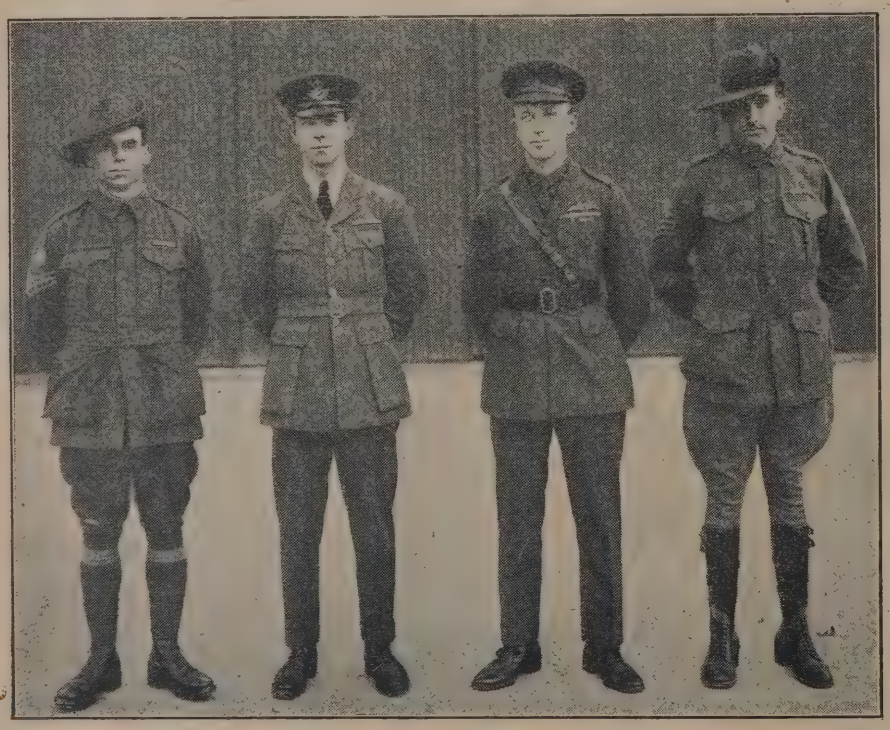
THE AUSTRALIAN FLIGHT.



Everyone concerned with the successful flight to Australia by the Vickers "Vimy" biplane and its Rolls-Royce engines deserves the heartiest congratulations. The enterprise in itself was sufficiently difficult, but it has been made considerably more so by the fact that the Department of Civil Aviation and the Royal Aero Club in collusion postponed the start of the competition until a date after which none could reasonably expect fair weather. On the other hand, it may perhaps be argued that if an earlier date for the start had been fixed no aeroplanes would have been ready to start.

One knows of at least one machine—a Sopwith "Pup" with an 80-h.p. Le Rhone engine—which was to have been piloted by Lieut. Bert Hinkler, late R.N.A.S., which could have started several weeks before the authorised date, and judging by the success attending the efforts of the gallant M. Poulet with two 80-h.p. Le Rhone engines, it is reasonable to suppose that Mr. Hinkler would have accomplished his journey, though perhaps not within the statutory 30 days.

Here one would like to place again on record the opinion that the Department of Civil Aviation and the Royal Aero Club were both acting outside of their rights and also outside the spirit of sportsmanship in fixing a date and imposing regulations as they did, for it will be remembered that Mr. Hughes, on behalf of the Australian Government, offered a prize of £10,000 to "the first Australian aviator to reach Australia by air." By imposing a time-limit, regulations of various sorts, and a date before which none was allowed to start, the authorities acted in a manner contrary to the spirit of the Australian offer and to a considerable extent spoiled the competition.

None the less, as is customary in time of stress, the British spirit triumphed over, or because of, obstacles, and the greater credit is therefore due to Capt. Ross Smith, his brother Lieut. Keith Smith and Sergts. Bennett and Shiers. One knows that Capt. Ross Smith himself would be the first to disclaim any more credit for himself than is due to his companions.

There are others also who are entitled to a goodly share of the honour. For example, there is Mr R. K. Pierson, the designer of the machine. Also, there are Mr. Maxwell Muller and Mr. Archibald Knight, who run the Vickers Weybridge works so ably and have been responsible for the construction of all the Vimy machines, not to mention many hundreds of other machines which have won the firm a high reputation for good workmanship during the war. Also, there is Capt. Acland, now chief of the Vickers Aviation Department, who made the arrangements for the flight. And it is well to remember the late Major Herbert Wood, to whose foresight was due the adoption of the Vimy design, and the late Capt. Gordon Bell, to whose great skill and experience as a pilot were largely due the final modifications of the type.

Sjt. W. H. Shiers, A.F.M., Lieut. Keith Smith, Capt. Ross Smith, M.C., D.F.C., A.F.C., Sjt. J. M. Bennett, M.S.M., A.F.M.

Strange Comments.

The success of the flight has produced a number of strange comments thereon in the shape of pronouncements from people in public positions, some of which are given verbatim in the report of the flight which appears hereafter.

Perhaps the most amusing of all is that from Mr. D. Lloyd George, presently Prime Minister of Great Britain, whose remark that the flight "shows how inventions of war can advance the progress of peace" is typical of the man who, in his desire to be in the front of public opinion, neglects entirely to learn what has been done in the past. The achievement of the "Vimy" machine shows perhaps how the experiences of war can be adapted to the work of peace, but nobody concerned with the machine or its engines would claim that it contains any actual inventions of war. The "Vimy" and its engines are rather the development of knowledge gained long before the war by the pioneers of aviation.

Mr. Churchill's remark that the flight shows that "the new element has been conquered for the use of man," though perhaps badly expressed, does at any rate convey the idea which Mr. Churchill intended to convey, namely, that this great flight from one extreme of the British Empire to the other shows that our aircraft have conquered the air for commercial purposes as they conquered it in war. Mr. Churchill's enthusiasm probably prevented him from realising for the moment that air is certainly not a new element but is at least as old as any form of life.

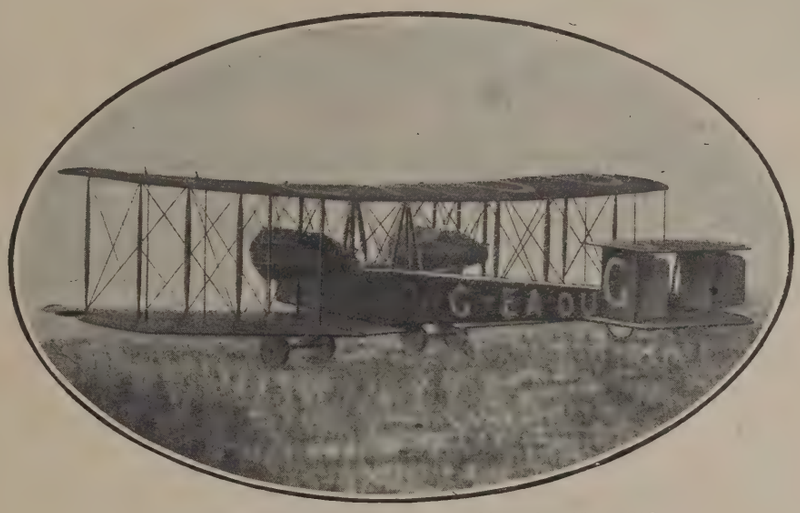
The Air Council is itself to be congratulated on the moderation and sound common sense of its message. The flight is in fact an outstanding example of skill and endurance. Nothing could exceed the pluck and determination shown by the crew in facing the appalling weather conditions under which they flew, nor their skill in nursing their engines and in keeping their correct course.

The Real Mail Service.

Quite one of the silliest comments on the performance is that alleged to have been made by Lord Inchcape, presiding at the meeting of the P. and O. Steam Navigation Co., on Dec. 11th. He is reported as having said that he read in a morning journal that an aeroplane had reached Calcutta in 16 days from London. That was just the time that their mail took when it went by way of Brindisi through the Suez Canal, down the Red Sea, across to Bombay and over to Calcutta by rail.

Apparently Lord Inchcape, like many other commentators on the performance, entirely omitted to note that the "Vimy's" performance in no way resembles the work of a regular mail service. The "Vimy's" performance may, in fact, be compared with the late Col. Burnaby's ride to Khiva, or with one of those famous cavalry rides popular before the war, such as that from Berlin to Vienna, in which the same horse and man had to complete the full journey.

A mail service, on the other hand, would be run by relays of machines and pilots, each pilot and machine covering a stage of not more than 500 or 600 miles, and then handing the mails and passengers to a fresh pilot and crew. In this way the mails would travel at least 1,000 miles a day, even during the short days of winter, and in the summer they would probably travel 1,500 miles a day. Thus Calcutta would be reached (a distance of nearly 7,000 miles) in four to seven days, and Australia would be reached in a matter of 10 to 15 days, so that the air mail time to Australia would be in fact something less than Lord Inchcape's record time to Calcutta.



An Unfortunate Comparison.

That usually well-informed journal, the "Morning Post," in common with the various other papers, makes a very stupid mistake over the flight. It says: "A couple of years ago the feat would have been regarded as a very doubtful enterprise, and three or four years ago it was in fact impossible." This, of course, is sheer nonsense.

IMPERIAL COURT, BASIL ST., KNIGHTSBRIDGE, S.W.3.

THE GRAHAME-WHITE—ROLLS-ROYCE AERO LIMOUSINE.

THIS machine, which can be seen in flight at the London Aerodrome, Hendon, has been designed specially for pleasure and commerce. It is not an adapted War machine, but is a specially constructed Limousine, fitted with two Rolls-Royce engines, luxuriously upholstered, and containing an electrically heated carpet. There is ample accommodation for 4 passengers. The pilot, with whom communication is maintained by speaking-tube, sits in a separate compartment above, and at the rear of, the passengers' quarters.

There is also the Grahame-White—Rolls-Royce Aero Limousine (9 seater), which is of the same construction as the 5-seater, with slight variations. The front cabin has been enlarged to take 6 passengers and the pilot. Moved farther back, between the pilot and planes, a special cabin has been placed to afford comfortable accommodation for 2 additional passengers or luggage.

For those requiring a sporting machine there is the Grahame-White Bantam Single-seater, fitted with 80 h.p. Le Rhone Engine. Speed 100 miles per hour.

Illustrated catalogues and further information regarding the above and other types of machines may be obtained upon application to:

TRADE MARK

SPEED WITH SAFETY

In 1913 the late M. Brindejonc des Moulinais, on a Morane with an 80-h.p. Le Rhone engine, flew from Paris to Warsaw, about 900 miles, in a day, continuing on following days to Petersburg and thence via Königsberg, Copenhagen, Bremen, and Amsterdam, to Brussels and London, after which he flew back to Paris, in all a total distance of 3,210 miles. This tour was, in fact, but little inferior in distance to a flight from London halfway to Calcutta. And so far as aerodromes were concerned, Europe in those days was less well equipped than is the route to India to-day.

Also in 1914 Herr Rudolf Böhm flew for 24 hours and 12 minutes without alighting, a feat which has never been achieved since then, though two other German pilots had previously come very near it. The only other aviator to approach the time was that same brave M. Poulet who so nearly achieved the distinction of being the first aviator to fly to Australia from Europe. M. Poulet's duration record was 18 hours.

Furthermore, just before the war Herr Suvelack flew from Berlin to the Turkish frontier at Eggri Palanka with a passenger in a non-stop flight of 1,000 miles—a longer non-stop flight than any accomplished in the course of the voyage to Australia. Thus one sees that had there been adequate organisation the voyage to Australia might very possibly have been achieved before the war— and by a German at that.

Knowing the Course.

Apropos organisation,—it has been pointed out that Capt. Ross Smith had a considerable advantage over his competitors in that he was the only one who had been over the course before starting. It will be recalled that Capt. Ross Smith accompanied Brig.-Gen. Borton in his survey of the course. As, in fact, he reached the more difficult portion of the course before any of his competitors, this advantage would appear not to have been as great as it might have been if any of his competitors had reached that section before him and had crashed en route through ignorance of the course

On the other hand, there is also the equal possibility that if Capt. Ross Smith also had been ignorant of the course he might have crashed his machine in landing anywhere between Calcutta and Australia, and so might have been overtaken. In either case his previous knowledge of the course was an important factor in his success.

Yet one may equally argue that the fact of his having covered the course beforehand is the greater evidence of his courage in that he knew the difficulties with which he would be faced and so did not enter upon the last stages in that ignorance which is bliss.

It is also of interest to note that as the result of the study of the course by Gen. Borton and Capt. Ross Smith, competitors were advised by the Air Ministry to fit their machines with floats at Calcutta and cover the rest of the course as seaplanes. Despite this, Capt. Ross Smith himself preferred to take the risk of covering the whole distance with his machine fitted with a land undercarriage.

The Great Deed.

However, the great point is that after all the flight has been done and that British aviators have done it. The fact that it might have been done months before is merely consonant with the British way of doing everything. And we have largely to thank our national luck for the fact that owing to the illness in India of his faithful friend and mechanic, M. Benoist, M. Poulet did not get there first.

Though, as one has already pointed out, the voyage could have been done some months earlier, and might in point of fact have been done five years ago, none the less we have now definite proof that given careful piloting and skilful mechanical attention, a British aeroplane with British engines can maintain truly remarkable regularity over an extraordinary distance.—C. G. G.

THE END OF THE JOURNEY.

The Vickers "Vimy" Machine.

The first flight from Great Britain to Australia was accomplished on Dec. 10th, when Capt. Ross Smith, M.C., D.F.C., A.F.C., Lieut. Keith Macpherson Smith, Serjt. J. W. Bennett, A.F.M., M.S.M., and Serjt. W H. Shiers, A.F.M., in their Vickers-Vimy machine, arrived at Port Darwin at 5.30 a.m. Greenwich mean time, or 3.30 p.m. Australian time.

The last reports published in this paper carried Capt. Ross Smith's messages up to his arrival at Singapore. These messages continue as follows :—

The Pilot's Dispatches.

"After a day's rest we left Singapore for Kalidtjatti, near Batavia, in Java. This was a distance of nearly 700 miles, and the worst stage of the journey as regards landing-grounds. On arrival at the Dutch military flying school we were greeted by the Governor-General of the Dutch East Indies and various other people. We had expected that the last stage of the journey from Singapore to Port Darwin would be the most difficult, but as soon as the Governor-General heard that aeroplanes were flying from England to Australia in this £10,000 competition he ordered aerodromes to be constructed at different points through the Dutch islands.

"Next day we went from Kalidtjatti to Sourabaya in an uneventful trip. The aerodrome had been constructed on reclaimed land which was apparently hard and quite fit to land on, but was in reality very soft underneath. We landed successfully, but soon after, when taxi-ing, the machine sunk to the axles. It was necessary to obtain the assistance of a local engineer and 200 coolies to get the machine out again. We decided that the only possible way to get the machine off again would be to make a road of bamboo mats for the wheels.

"By dark we had constructed a thin road sufficient to get the machine to the end of the ground. It was very slow work as we had not sufficient mats for the whole distance, and had to use them in relays. It had taken us seven hours to move the machine 400 yards, during which time the machine stood a lot of pulling about by the coolies. We were all thoroughly tired out after our labours and had intended to go to bed early, but the British residents of Sourabaya had arranged a dinner in the evening. We were at the aerodrome again at daylight. During the night the engineer had collected as many bamboo mats as possible from the whole district—in fact, he had pulled down numerous native houses to get a sufficient quantity

"By 9 o'clock in the morning we had built a road for our wheels, about 300 yards in length, and attempted to start off after running about 500 yards. Some of the mats flew up and caught in the tail and swerved the machine round off the track, with the result that we were once more very badly bogged. Again we dug her out, with the aid of the coolies, and got back to the starting place. We then decided to widen the track and lace the mats together. We succeeded in getting more mats, and eventually at twelve o'clock had constructed a road of laced mats 350 yards in length and 20 yards wide, and we then started up again and succeeded in getting off with bamboo flying in all directions from our propellers.

"We were thankful to leave Sourabaya and much relieved to be in the air once more. We then flew due east along the islands and landed at Bima, in Sumbawa, where there is an excellent Dutch aerodrome. Here we were entertained by the local Sultan and Dutch Controller, both of whom did everything possible for our comfort. Next morning we started for Atamboca, in Timor Island, where there is a Dutch military station. We were entertained by the commandant, who told us that the natives regarded us as dead spirits who could come back to the world, and as they could not rest spent their time in flying from place to place. We were very glad to be safely on the ground in Timor, as it meant only 350 miles from there to Port Darwin. The country is very similar to parts of Australia, and is covered with gum trees, which reminded us very much of home.

"On Wednesday, Dec. 10th, we were up at dawn and rode from the military camp to the aerodrome, a distance of three miles, on Timor ponies. Just as we were ready to start a thick fog came on which delayed us for about two hours. However, about 8.30 a.m. the fog lifted and we started off and headed for Darwin, flying by compass.

"After being out of sight of land for about two hours we sighted the cruiser "Sydney" in exactly the position we had asked her to be in in case of need. We were very relieved to see her, as we felt that if anything did go wrong over the water we would have friends to rescue us. We had no wireless on board, so we dropped messages in a bottle attached to a small parachute made by ourselves, stating that all was going well. That message was picked up.

"Two hours after leaving the "Sydney" we sighted Bathurst Island, our first glimpse of Australia, and about three-quarters of an hour later arrived at Port Darwin."

Some Facts and Figures.

As the machine left Hounslow at 9.10 a.m. on Nov. 12th, the journey was completed in 668 hours 2 min. Thirty days, or 720 consecutive hours, was the time allowed by the rules of the Australian Government's Competition, and so the voyage was completed well within the time limit.

A telegram has been sent in the following terms by the High Commissioner of Australia to Mr. Hughes, the Prime Minister :—

"Have been requested by Royal Aero Club to transmit the following to you :—'Subject to verification of machine, Captain Ross Smith has fulfilled the conditions laid down by Australian Government for £10,000 prize for flight from Great Britain to Australia. The Royal Aero Club, under whose competition rules and auspices the flight was made, will award prize to Captain Ross Smith. Royal Aero Club tenders its heartiest congratulations to the Prime Minister and all Australians on the successful accomplishment of this epoch-making flight.'—(Signed) FISHER."

Congratulations.

Messages of congratulations have been sent to Capt. Ross Smith. In fact, a telegram from Port Darwin dated Dec. 11th stated that Capt. Ross Smith was inundated with telegrams.

The Air Ministry announced the text of the most important messages as follows :—

From H.M. The King :—

"Delighted at your safe arrival. Your success will bring Australia nearer to the Mother Country, and I warmly congratulate you and your crew.—GEORGE R.I."

From the Prime Minister :—

"Heartiest congratulations. Your flight shows how inventions of war can advance progress of peace.—D. LLOYD GEORGE."

From the Secretary of State for Air :—

"Well done. Your great flight shows conclusively that the new element has been conquered for the use of man.—W. S. CHURCHILL."

From the Air Council :—

"Air Council congratulate you and crew on great skill and endurance shown in your achievement.—W. A. ROBERTSON, Secretary Air Council."

From the Comptroller-General of Civil Aviation :—

"Most sincere congratulations on successful termination of great flight. Your progress has been watched by all here with keenest interest.—F. H. SYKES."

Comment upon the excellent performance of the machine and the two 350 h.p. Rolls-Royce "Eagle" engines is unnecessary, as their merit is so obvious, and in his diary Capt. Ross Smith continually pays them tribute.

The voyage to Australia has been made in quicker time, for in June, 1893, mail was carried from London to Adelaide in 23 days 11½ hours, going overland to Brindisi and thence by the P. and O. liner "Himalaya."

The always entertaining American Press—to wit, the New York "Tribune"—says :—"He has done a wonderful thing for the prestige of the British Empire and the fame of the Smiths. Australia owes him £10,000, and he has earned the money." The Convention of Smiths, who hold an annual meeting, will make Capt. Ross Smith "an honorary member of America's biggest and not least illustrious family."

The actual flying time, according to a "Times" correspondent, was 124 hours and the average speed 75 m.p.h. Capt. Ross Smith did not carry food, except tinned bully. His engines went well, but he had to work practically every night tinkering at the machine. He always arose at dawn. The hospitality of the Netherland Indies officials was overwhelming.

Mr. Hughes sent a congratulatory message to Port Darwin for presentation to the aviators on arrival, and has offered to purchase the machine for the War Museum. A message from Melbourne states that the military authorities are ascertaining the suitability of Flemington racecourse as a landing place there, so that there will be accommodation for the large crowd expected to witness the arrival of the machine.

The following table shows Capt. Ross Smith's progress from the time he left Hounslow on Nov. 12th :—

Miles.	Place.	Date of Arrival.
605	Lyons	Nov. 12th
1,050	Pisa	Nov. 13th
1,225	Rome	Nov. 15th
1,562	Taranto	Nov. 16th
—	Suda Bay	Nov 17th
2,845	Cairo	Nov 18th
3,259	Damascus	Nov. 19th
—	Ramadie	Nov. 20th
4,047	Basra	Nov. 21st
4,660	Bunder-Abbas (Persia)	Nov. 23rd
5,401	Karachi	Nov. 24th
6,093	Delhi	Nov. 25th
6,443	Allahabad (with a stop at Muttra)	Nov. 27th
6,895	Calcutta	Nov. 28th
7,342	Akyab	Nov. 29th
7,688	Rangoon	Nov. 30th
8,038	Bangkok	Dec. 1st
—	Singora	Dec. 2nd
8,900	Singapore	Dec. 4th
9,549	Kalidtjatti (West Java)	Dec. 6th
10,341	Bima (Sumbawa)	Dec. 8th
11,294	Port Darwin	Dec. 10th

THE MARTINSYDE CREW.

Henry Fraser, Mechanic. Capt. C. E. Howell, D.S.O., M.C., D.F.C., Pilot.

THE BLACKBURN KANGAROO.

Captain Wilkins, M.C., arrived at Suda Bay on Dec. 5th and left for Egypt on Dec. 8th. When forty miles from land the main return oil pipe of the port engine broke and the pilot had to return to Suda Bay. This flight was successfully accomplished on the starboard engine alone, and a safe landing was made. The engine itself was undamaged.

THE MARTINSYDE DISASTER.

The Air Ministry has announced that Capt. C. E. Howell, D.S.O., M.C., D.F.C., left Taranto at midday on Dec. 9th for Athens.

Lloyd's agent at Corfu telegraphed on Dec. 13th :—

"Information just received, British aircraft wrecked off St. George's Bay, Corfu, Dec. 10th; no hope of survivors; log washed ashore; certificate number 332; identification mark G U M R, Captain C. E. Howell, Melbourne; number of licence 412; Hounslow for Melbourne Leaving to investigate."

Such precautions had been taken that floats were awaiting the machine at Calcutta for its voyage over the sea in the last part of the journey. Unfortunately when the accident occurred the machine was still fitted for landing.

This fatality and the mishap which occurred to the Blackburn "Kangaroo" point to the safety of a twin-engined machines on such long-distance flights.

Captain Howell had sent his wife to Australia on board the "Orsova," and had hoped to overtake the steamer near Naples. Before starting he intimated that he would greet his wife by circling round the vessel and dropping a message.

THE VICKERS-ROLLS PRESENTATION TO THE NATION.

The presentation to the nation of the Vickers-Vimy Rolls-Royce aeroplane which, piloted by Capt. John Alcock and Lieut. Arthur Whitten Brown, made the first non-stop trans-Atlantic flight last June, was performed at the New Science Museum building, South Kensington, on Dec. 15th.

The chair was occupied by Dr. Ogilvie, director of the Science Museum, and among those present were Air-Marshal Sir H. M. Trenchard, Lieut.-Col. J. T. C. Moore-Brabazon, M.P., Capt. Sir John Alcock, Mr. Claude Johnson (of Rolls-Royce, Ltd.), and the High Commissioners for Australia, New Zealand, Canada, and Newfoundland.

Mr. Douglas Vickers said that all would agree with him that the aeroplane would constitute an historical landmark. It was not in any way a machine specially made for the occasion upon which it had been used; it was to have been a Berlin "bomber." He considered the flight from London to Australia as perhaps greater than the Atlantic effort, for its difficulties had included a new route hardly surveyed, and many variations of climate. The effort had demonstrated that it would be good to arrange a relay service, and then letters might be sent to Australia within a week.

On behalf of Sir Alfred Mond, Dr. Ogilvie accepted and acknowledged the gift.

Mr. Claude Johnson asked the chairman to accept that portion of the aeroplane for which Rolls-Royce were responsible.

A lunch followed at the Hyde Park Hotel. Mr. Douglas Vickers, who presided, first proposed "The Guests," to which Sir Alfred Mond responded with his wonted eloquence. Mr. Vickers then proposed, "The closer reunion of the old Mother Country and Australia."

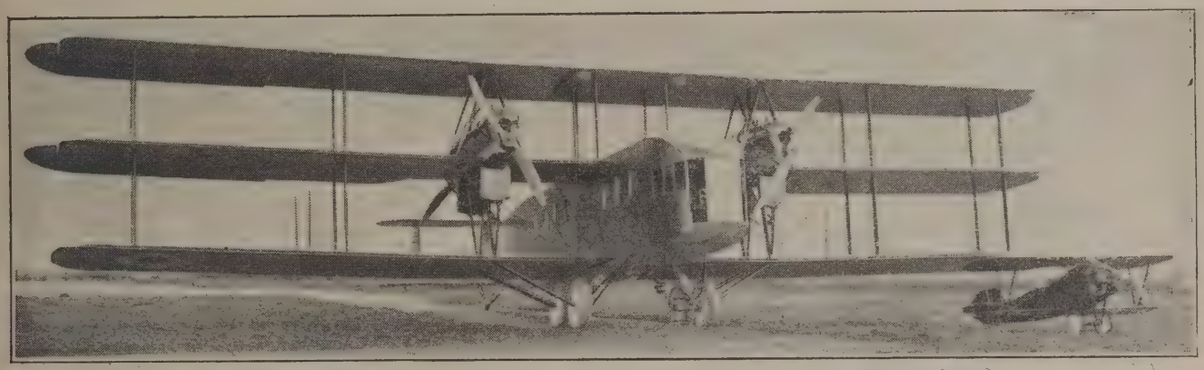
Mr. Fisher (High Commissioner for Australia), in responding, said that the machine on which Capt. Ross Smith made his famous flight would never return to this country. Australia would keep that machine. In an enterprise of that kind it was only to be expected that there would be losses, and they bowed their head to those daring and brave men who tried to carry their machines through but failed.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE PRODUCTS OF THE BRITISH AIRCRAFT INDUSTRY.



In this and the two following issues of THE AEROPLANE there will be found a description of a number of aircraft, aero-engines, and aeronautical accessories which represent what is being produced by those British firms which are maintaining their interest in the Aircraft Industry.

The information relating to these various products has been supplied by the firms themselves, and it may be assumed that the amount of information supplied is a measure of the extent to which each firm believes its own work to be of interest.

Also, the order in which the matter is arranged corresponds roughly to that in which the various concerns have responded to a request for information as to their work.

The great majority of these firms are members of the Society of British Aircraft Constructors, an organisation which has done more for British Aviation than any other.

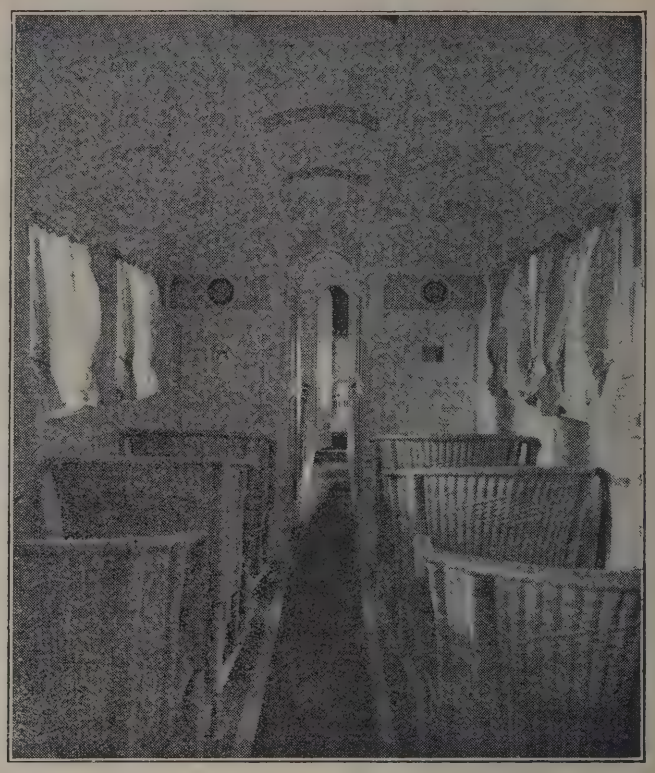
THE BRITISH AND COLONIAL AEROPLANE CO., LTD.

The Bristol "Pullman" Triplane, and the Bristol "Babe." A study in contrasts.

Founded in 1910 by the late Sir George White, the British and Colonial Aeroplane Co., Ltd., usually known as the Bristol Company, have since their earliest days taken a prominent part in the development of British aviation. During the war they did much to secure the necessary supplies of aircraft for the Allied Armies, and the Bristol "Fighter" probably did more than any other single type of aeroplane to secure that superiority in the air which so helped towards the final victory.

With the coming of peace they naturally have set their house in an order appropriate to the changed conditions, and the following details of their more recent machines—some of which will be on show at Paris—will give an idea of their preparedness for the demands of to-morrow.

THE "BRISTOL" PULLMAN TRIPLANE.



Amongst the large aeroplanes constructed to provide a high-speed machine capable of carrying a considerable load of passengers and cargo in addition to fuel for a lengthy flight, the "Bristol" Pullman Triplane occupies a position apart. The four 410-h.p. Liberty engines with which it is fitted ensure absolute reliability and safety, whilst the tasteful and luxurious appointments of the roomy Pullman ensure the highest comfort a traveller may desire.

The car in which the 14 passengers, carried in addition to the pilot and engineer, are accommodated is seven feet in height and wholly enclosed. A central gangway affords access to the comfortable fauteuils which, though removable, are normally placed on either side of the car. Large Triplex glass

The Fuselage of the Bristol "Pullman" in course of construction.

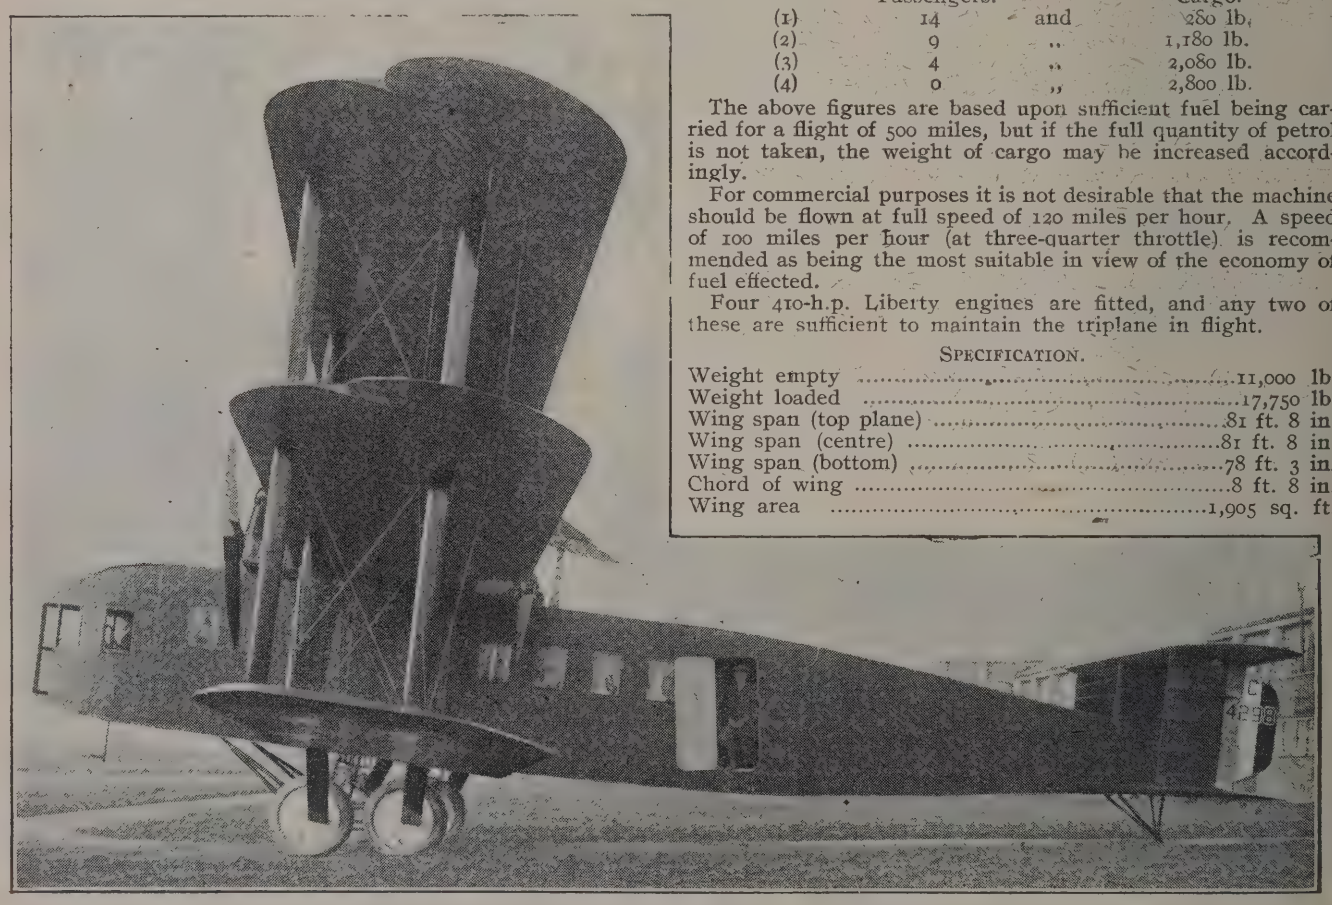
Two Interior Views of the Bristol "Pullman"—on the left looking aft and on the right looking forward.

windows are provided for the convenience of each passenger, and an adequate system of heating and lighting by means of electricity is installed. The question of ventilation has also been carefully studied.

Any or all of the seats may be removed for the conveyance of mails or cargo, and a total space of 570 cubic ft. can thus be made available. In addition to the two pilots the machine is capable of lifting a load of 2,700 lb. and fuel for 5 hours' flight, or alternatively 4,000 lb. with fuel for 2½ hours' flight. These figures are based on an economical speed of from 100 to 103 m.p.h., i.e., at three-quarter throttle, giving a sufficient reserve of power to reach a maximum speed of 125 m.p.h. if necessary.

The following examples give an idea of the manner in which the accommodation can be arranged, but these figures may be varied to suit requirements :—

	Passengers.		Cargo.
(1)	14	and	280 lb.
(2)	9	,,	1,180 lb.
(3)	4	,,	2,080 lb.
(4)	0	,,	2,800 lb.



The above figures are based upon sufficient fuel being carried for a flight of 500 miles, but if the full quantity of petrol is not taken, the weight of cargo may be increased accordingly.

For commercial purposes it is not desirable that the machine should be flown at full speed of 120 miles per hour. A speed of 100 miles per hour (at three-quarter throttle) is recommended as being the most suitable in view of the economy of fuel effected.

Four 410-h.p. Liberty engines are fitted, and any two of these are sufficient to maintain the triplane in flight.

Specification.

Weight empty	11,000 lb.
Weight loaded	17,750 lb.
Wing span (top plane)	81 ft. 8 in.
Wing span (centre)	81 ft. 8 in.
Wing span (bottom)	78 ft. 3 in.
Chord of wing	8 ft. 8 in.
Wing area	1,905 sq. ft.

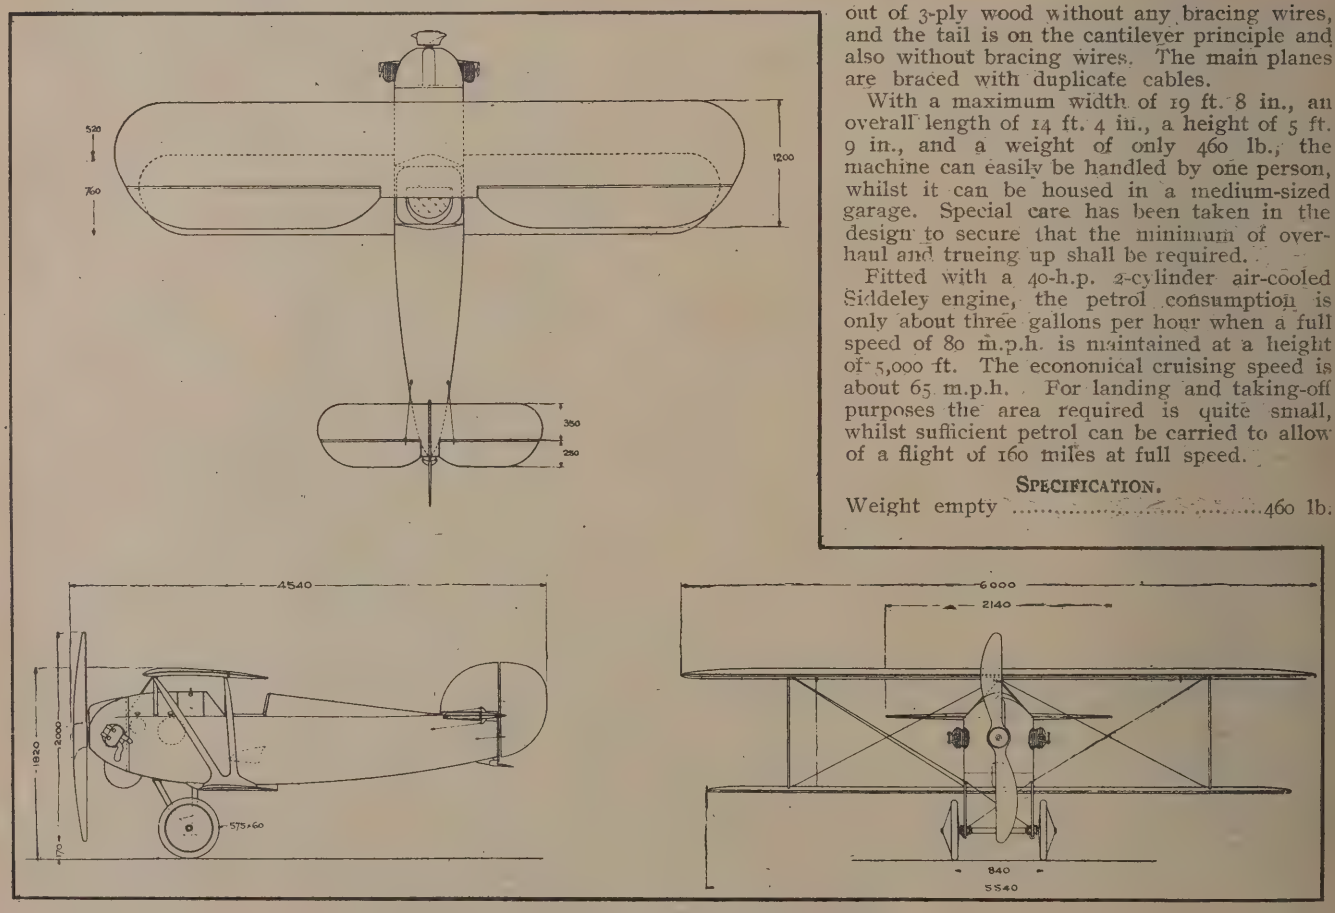
A Side Elevation of the Bristol "Pullman" Triplane (four 410-h.p. Liberty engines).

Wing loading	9.3 lb. per sq. ft.
Overall length	52 ft.
Maximum height	20 ft.
Petrol capacity	430 galls
Maximum speed	125 m.p.h.
Cruising speed	100 m.p.h.
Landing speed	55 m.p.h.
Climb to 10,000 ft.	12 min.
Ceiling	15,000 ft.

THE BRISTOL "BABE."

The Bristol "Babe" has been constructed to meet the demand for a small single-seated aeroplane in which the costs of upkeep and the actual running costs are reduced to the absolute minimum.

The fuselage is constructed throughout of 3-ply wood without any bracing wires, and the tail is on the cantilever principle and also without bracing wires. The main planes are braced with duplicate cables.



The Bristol "Babe" in Skeleton Form.

With a maximum width of 19 ft. 8 in., an overall length of 14 ft. 4 in., a height of 5 ft. 9 in., and a weight of only 460 lb., the machine can easily be handled by one person, whilst it can be housed in a medium-sized garage. Special care has been taken in the design to secure that the minimum of overhaul and trueing up shall be required.

Fitted with a 40-h.p. 2-cylinder air-cooled Siddeley engine, the petrol consumption is only about three gallons per hour when a full speed of 80 m.p.h. is maintained at a height of 5,000 ft. The economical cruising speed is about 65 m.p.h. For landing and taking-off purposes the area required is quite small, whilst sufficient petrol can be carried to allow of a flight of 160 miles at full speed.

Specification.

Weight empty	460 lb.

XMAS PRESENTS.

THE most acceptable present is a good book. Ever increasing costs of production have compelled publishers to advance all book prices.

The *Aeroplane* for the current week proposes to reverse the process.

Copies of any of the following books will be sent at two-thirds the published price:—

	Published Price.	Terms till Dec. 24th.
THE MOST BEAUTIFUL FLYING BOOK—		
Capt. Saundby's FLYING COLOURS	£ s. d.	£ s. d.
Edition de luxe	2 2 0	1 8 0
Popular Edition	15 0	10 0
THE MOST HUMAN OF FLYING RECORDS—		
Major McCudden's "FIVE YEARS IN THE R.F.C."	7 6	5 0
THE MOST AMUSING OF PARODIES— (A delightful book for children of the A.F.)		
Major Hume's "NURSAIRY RIMES"	2 6	1 10
THE MOST THRILLING OF AEROPLANE RECORDS— (Dropping spies behind the German lines).		
Mortane's "SPECIAL MISSIONS OF THE AIR"	3 0	2 0
THE STORY OF GERMANY'S GREATEST AIR FIGHTER—		
Richthofen's "RED AIR FIGHTER"	3 6	2 4
THE SIMPLEST AUTHORITATIVE ACCOUNT OF AIRCRAFT DEVELOPMENT AND POLICY		
Col. Gill's "THE AERIAL ARM"...	6 6	4 4

Thus for HALF-A-GUINEA readers of the *Aeroplane* may secure—

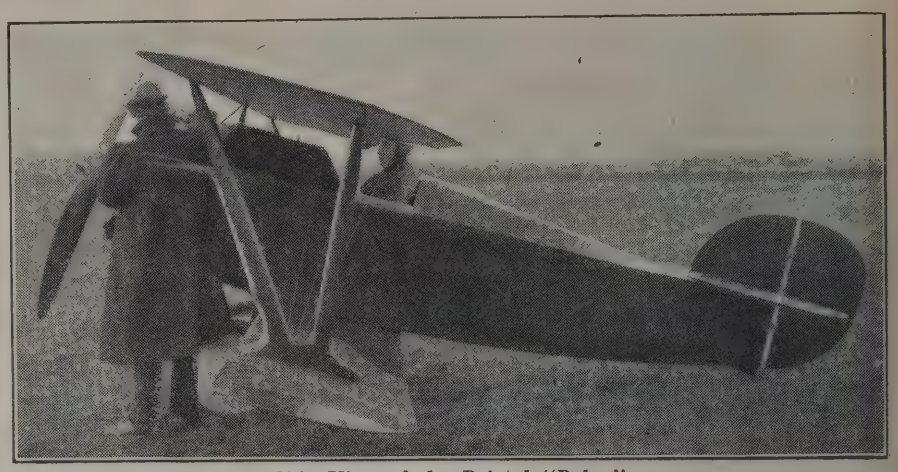
NURSAIRY RIMES ... ... (2/6)
SPECIAL MISSIONS OF THE AIR (3/-)
THE RED AIR FIGHTER ... (3/6)
THE AERIAL ARM ... ... (6/6)

or for £1 5s. 6d., those four books and
FIVE YEARS IN THE R.F.C. ... (7/6)
FLYING COLOURS ... ... (15/-)

or 11/- half-a-dozen copies of NURSAIRY RIMES.

or for £1 four copies of FIVE YEARS IN THE R.F.C.

or for 7/- three copies of THE RED AIR FIGHTER.



This is the best way to get a supply of books for Christmas presents on the most favourable terms.

Orders should reach us if possible before Wednesday next to ensure delivery by Christmas Day.

THE AEROPLANE, 61, CAREY STREET, W.C.2.

Weight loaded .....683 lb.
Wing span (top wing) .....19 ft. 8 in.
Wing span (bottom) .....18 ft. 8 in.
Chord of wing (top wing) ....3 ft. 11¼ in.
Chord of wing (bottom wing)...2 ft. 6 in.

Shipping Measurements.—This machine can be shipped complete in one case measuring 6 ft. by 6 ft. by 21 ft.

Side View of the Bristol "Babe."

THE BRISTOL "BULLET."

This single-seater machine is designed primarily for racing purposes and is fitted with a 450-h.p. Cosmos "Jupiter" air-cooled radial engine. Exceptional strength is the outstanding feature in the design, and to attain this object double spars are fitted throughout, even in the wings and tail. As a result any evolution can be carried out with perfect safety at the maximum speed of 160 miles per hour.

Three-quarter Rear View, the Bristol "Babe."

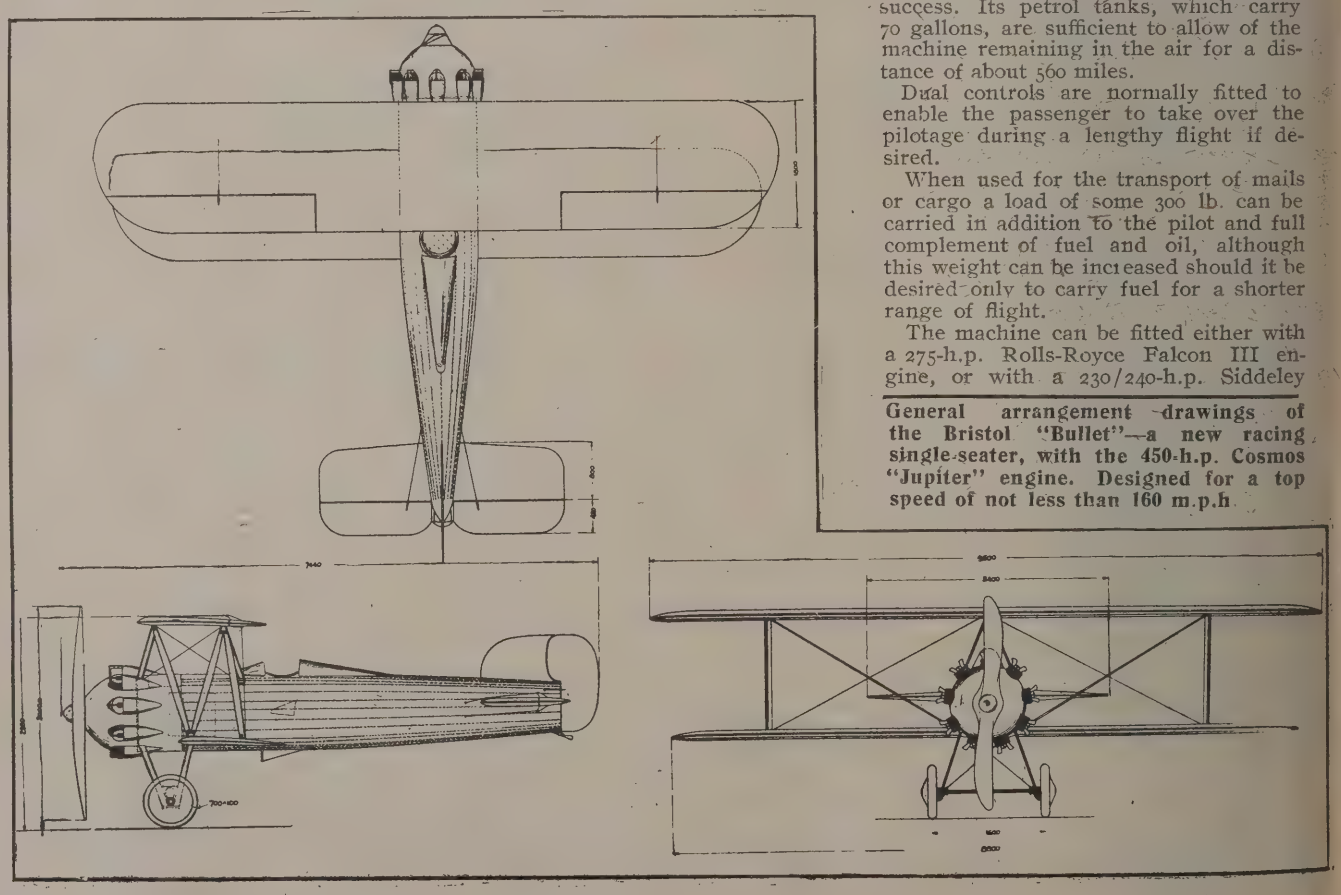
Best speed .....160 m.ph.
Landing speed .....50 m.p.h.

THE BRISTOL "TOURER."

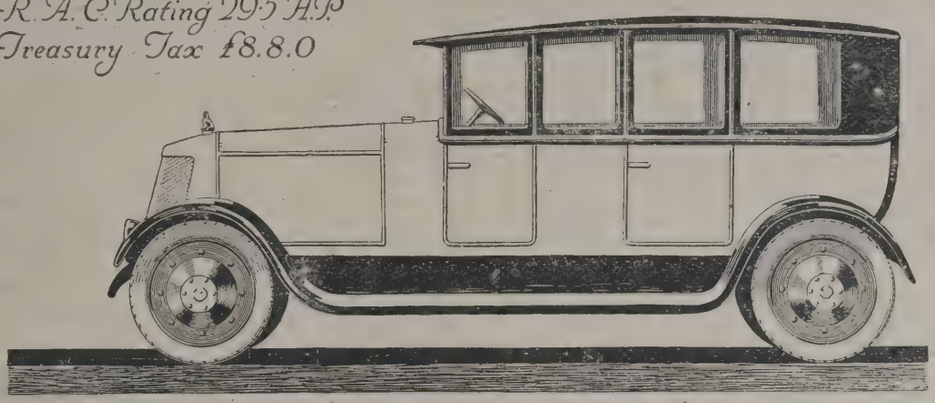


Amongst the post-war products of the British and Colonial Aeroplane Co. is the two-seater machine hereafter described.

Designed primarily to provide a machine of great dependability and capable of maintaining a fairly high speed for a considerable period of time, the "Bristol" Tourer has proved a great success. Its petrol tanks, which carry 70 gallons, are sufficient to allow of the machine remaining in the air for a distance of about 560 miles.

Dual controls are normally fitted to enable the passenger to take over the pilotage during a lengthy flight if desired.

When used for the transport of mails or cargo a load of some 300 lb. can be carried in addition to the pilot and full complement of fuel and oil, although this weight can be increased should it be desired only to carry fuel for a shorter range of flight.



The machine can be fitted either with a 275-h.p. Rolls-Royce Falcon III engine, or with a 230/240-h.p. Siddeley

General arrangement drawings of the Bristol "Bullet"—a new racing single-seater, with the 450-h.p. Cosmos "Jupiter" engine. Designed for a top speed of not less than 160 m.p.h.

The ARMSTRONG SIDDELEY Six Cylinder Car

R.A.C. Rating 29·5 H.P.
Treasury Tax £8.8.0

Saloon Double Phaeton (as illustrated) £1,000.

A Famous Motorist's Opinion.

"FROM one end to the other of the chassis, everything is made as well as it can be. . . . . To sum up, this 29·5 h.p. six-cylindered Armstrong Siddeley is a true after-war car, selling at prices (according to the coach work fitted) about one-half those quoted for many other chassis of equivalent engine power, which may or may not be as good jobs. They cannot be better. The price of £720 for the chassis, with a full complement of fittings, is the best evidence I have yet seen of a really courageous effort by a great firm, showing real confidence in their ability to make profits at this price in the future, when they have justified a really gigantic British output.

This car is right."

S. F. EDGE,
From the "Auto" Nov. 28th 1919.

PUBLIC opinion at the Olympia Show unanimously endorsed our statement that you cannot buy a better car than the new Armstrong Siddeley 6-cylinder. It is a motor carriage of high efficiency, stately appearance, and ample power—constructed of the best materials. ¶ It is light. It is comfortable. It is dependable. It runs smoothly, silently and easily managed. Maintenance costs are small. ¶ Three years' free inspection. ¶ You cannot buy a better car.

PRICE of CHASSIS EQUIPPED WITH Disc Wheels and one Spare Rim; four 820 × 135 Rubber Studded Tyres; Specially Designed Wings, Scuttle Dash with instrument board; Lucas Engine Starter and Electric Lighting, complete with 5 lamps, Mechanical Tyre Pump, Kit of Tools, etc. **£720**

Godbold's

"Puma" engine. Fitted with the former, the machine can attain a speed of about 125 m.p.h., with a normal cruising speed of about 90 m.p.h. When the latter engine is fitted the maximum speed is 120 m.p.h., and the cruising speed 85 m.p.h.

With either engine the petrol consumption for the distance traversed is the same although the consumption with the Rolls-Royce engine is 15½ gallons per hour, and with the Siddeley "Puma" 15 gallons per hour.

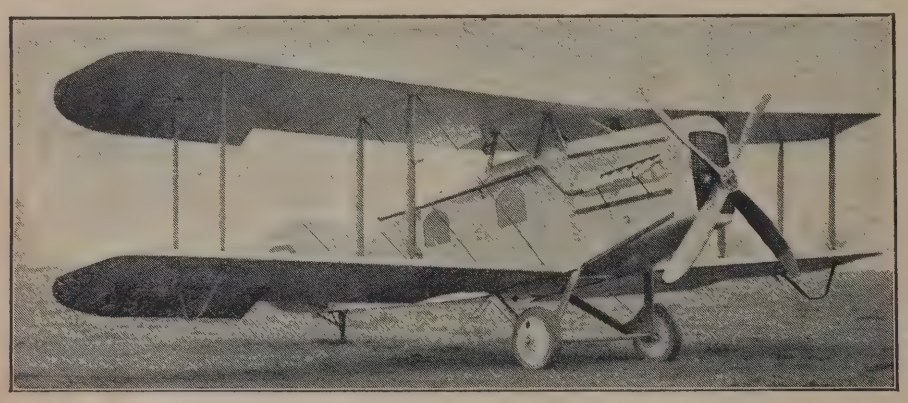
The Bristol "Tourer" (230-h.p. Siddeley "Puma" engine).

In the construction of this machine the Bristol Co. have arranged to make use of a large stock of materials and parts which were left on their hands by the cancellation of war contracts. The machine has been designed to utilize many components which are also part of the famous Bristol "Fighter," and it is thus possible to put the machine on the market at the extremely low price of £1,200, and to undertake to give rapid deliveries.

SPECIFICATION.

Weight (empty)	1,750 lb.
Weight (loaded)	2,800 lb.
Wing span	39 ft. 3 in.
Wing area	405 sq. ft.
Wing loading	6.92 lb. per sq. ft.
Chord of wing	5 ft. 6 in.
Overall length	25 ft. 9 in.
Maximum height	10 ft. 1 in.
Tankage (petrol)	70 gall.
Ceiling	20,000 ft.

THE WESTLAND AIRCRAFT WORKS.



The Westland "Limousine," described in its first edition in THE AEROPLANE of Aug. 13th, 1919, has been in continuous service in the firm's own interest since July and has flown many thousands of miles, giving extremely satisfactory results. Experience therewith has suggested only a few minor modifications for later editions of the machine, and the sample which the firm are exhibiting on their stand at the Paris Aero Show differs in no important way from the original. The Paris Show machine is to be fitted up for passenger travel, and like its predecessor will be most comfortably, and even luxuriously, appointed. The upholstering of the cabin will be in grey Bedford cord, and the colour scheme throughout is grey and aluminium.

The adjustable ventilators fitted to the cabin admit air through a diffuser box and gauge inlets, thus securing fresh air without draughtiness.

Hot-water pipes, supplied from the cooling-water system of the engine, are arranged to warm the cabin, and valves, accessible to the passengers, permit of temperature regulation by more or less "byepassing" the heater pipes. In addition to this machine the Westland Co. are to show a scale model of the "Limousine" fitted for mail-carrying, and a section of the "Limousine" cabin showing the method of construction.

During the Show the original "Limousine" will be stationed at Le Bourget aerodrome, and will serve to show how well this type of machine stands up to hard work.

Both the Westlands are to fly from Yeovil to Paris, and the firm hope to carry the whole of their exhibition material on the two machines themselves, without the aid of any other form of transport.

Three-quarter Front View of the Westland "Limousine."

Side View of the Westland "Limousine" (Rolls-Royce "Falcon" engine).

WM. BEARDMORE AND CO., LTD.

Those who are past the first bloom of youth may remember the Eastern King of musical comedy fame who claimed he "could do almost anything." His claim was doubtless exaggerated, but even if it be allowed *in toto*, more westerly concerns need not unduly humble themselves before him.

William Beardmore and Co., Ltd., judging from the record of their war products, not only can do, but appear to actually have done, almost everything—at any rate, everything that comes within the realms of engineering.

The major portion of their activities concerns this journal little, but amongst the offshoots of their activities the aeroplane and airship sections have a very direct importance.

In war time Beardmore's built B.E.2cs, Wight seaplanes, Nieuport two-seaters, Beardmore folding ships' scouts, Sopwith "Camels" and Handley Pages of the V/1500 type.

In addition they have designed a number of highly satisfactory machines of their own types.

BATH AIRCRAFT, LTD.

With the transition from war to peace it is extremely fortunate that many of the smaller aircraft firms who have been principally engaged in the manufacture of components and parts of aircraft, such as wings, struts, floats, propellers, etc., are sufficiently far-seeing not to banish aeroplanes from their future programme of production.

One of these firms is the Bath Aircraft, Ltd., of Lower Bristol Road, Bath, who, during the war were compelled to concentrate on components to meet the demand, with the result that they were unable to carry out their original intention of turning out complete machines.

With the completion of Government contracts, they are keeping their staff together by turning their attention to the manufacture of all kinds of woodwork, such as joinery, furniture, fancy goods, etc., for which their shops and machinery are eminently suited, and thereby maintaining themselves in readiness to re-enter the aircraft market at the earliest possible date.

Round the world by Air

—is mainly a question of organization and choice of flying stock.

As to the second factor, the B.A.T. Company can be of unusual assistance. For instance, we are the first people out with a purely commercial model (not a modified war type)—the B.A.T., F.K. 26—the machine with the largest cargo space and load capacity for its overall size and power yet produced.

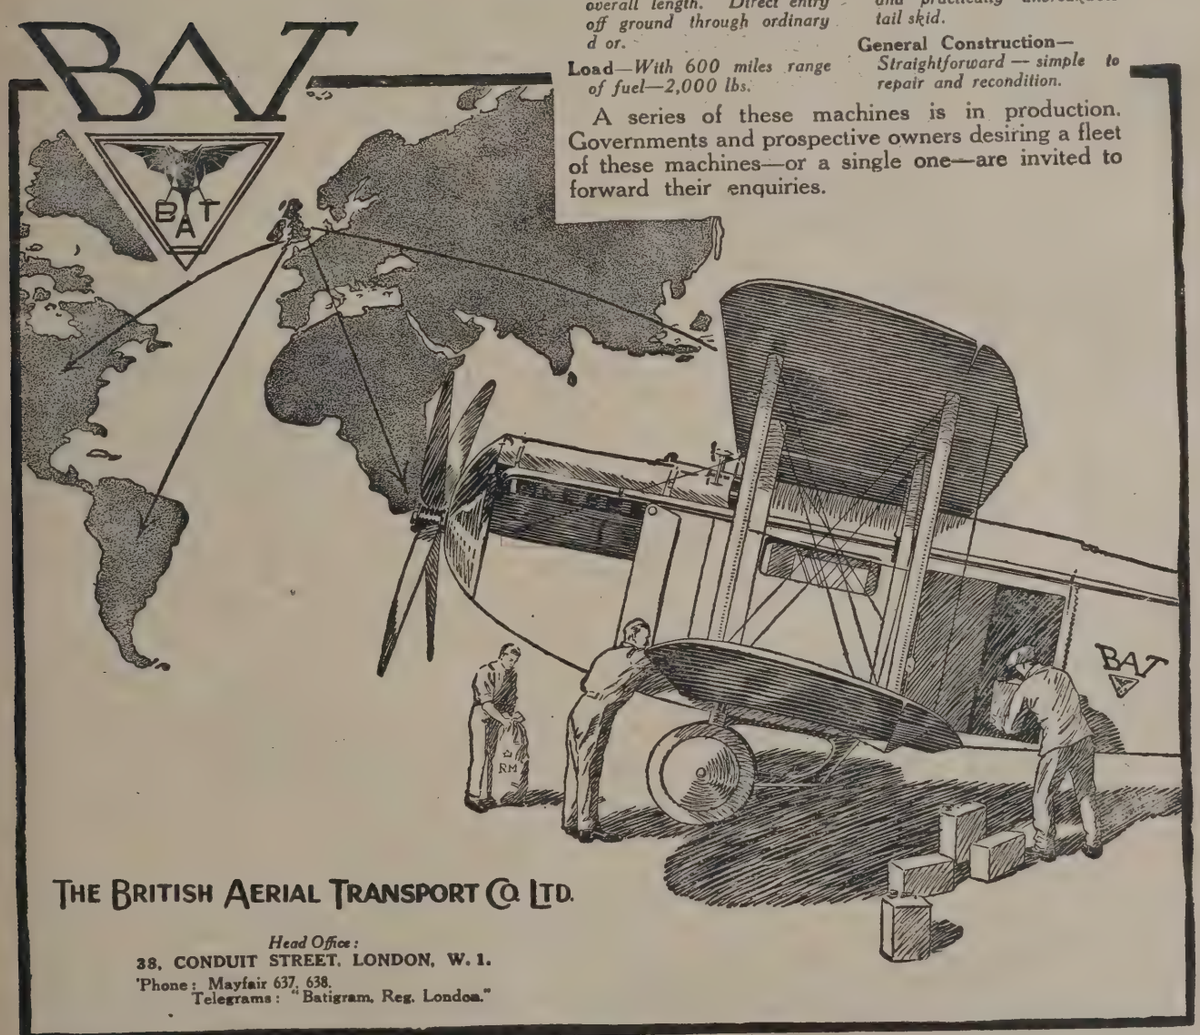
Here are some interesting points concerning F.K. 26 :—

Engine — *Rolls-Royce Eagle VIII.*

Speed—*45-120 m.p.h.*

Cabin—*Is clear of any transverse cross-bracings or other obstructions and measures 8 ft. by 3 ft. 3 in. by 6 ft.—this in a machine of only 33 ft. overall length. Direct entry off ground through ordinary door.*

Load—*With 600 miles range of fuel—2,000 lbs.*



Fuel Cost at full load—*7·2 pence per mile.*

Chassis—*A sturdy job, sprung by an unique combination of oleo and rubber shock absorbers.*

Tail—*Can be trimmed in flight from pilot's seat — steerable and practically unbreakable tail skid.*

General Construction—*Straightforward — simple to repair and recondition.*

A series of these machines is in production. Governments and prospective owners desiring a fleet of these machines—or a single one—are invited to forward their enquiries.

THE AUSTIN MOTOR CAR CO., LTD.

As is fairly well known, during the war the Austin Motor Car Co., Ltd., of Birmingham, devoted their whole energies to the quantity production of munitions of war of various kinds, with conspicuous success.

Amongst their products aeroplanes and aeroplane engines figured to no small extent, and their output of standardised aeroplanes of various types was extremely large.

In addition the firm were responsible for the design of quite a number of machines which gave uniformly excellent results on trial.

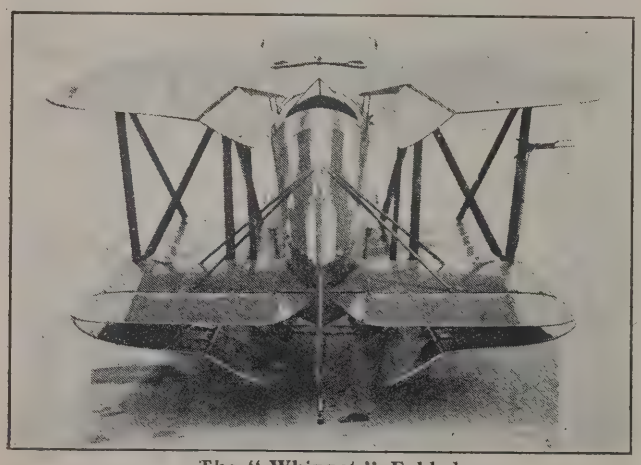
Amongst war machines their latest product—the "Greyhound," fitted with the A.B.C. "Dragonfly" engine—is now under official test, and is understood to be giving an extraordinarily fine performance.

The Austin "Greyhound" (A.B.C. 320-h.p. "Dragonfly" engine).

Front View of the Austin "Whippet" (45-h.p. Anzani engine).

Austins do not, however, propose to limit their aircraft activities to the military needs of the future, but have produced in the "Whippet" a machine which should appeal strongly to the sporting pilot as a private mount.

The "Whippet" is a small single-seater of 21 ft. 6 in. span, 16 ft. 3 in. long overall, and 7 ft. 6 in. height, weighing 580 lb. empty and 810 lb. fully loaded. Fitted with a 5-cylinder "Anzani" engine of 50 h.p., the machine has a speed range of from 35 to 85 miles per hour and climbs to 5,000 ft. in 10 min. It is easy to fly and sufficiently strong for all "stunting" purposes.



The fuselage is entirely built of steel tubes, without welded joints.

The wings are designed to a factor of safety of seven and follow nomal practice. They are arranged to fold back along the fuselage, where they are clipped automatically by appropriate catches. Interplane struts are of steel tube in N form, and, instead of bracing wires, diagonal steel tubes which act as tension members in flight and struts when on the ground are employed. There are thus no wing bracing wires to stretch and there is no "trueing up" required.

Compartments for tools and luggage are fitted beneath the pilot's seat, which is excellently upholstered and

The "Whippet" packed for transport.

The "Whippet" Folded.

The Long and the Short of it—the Austin "Whippet" alongside an Austin-built Handley Page O/400.

Aerial Photography

"THE BIRD'S EYE VIEW."

THE Aircraft Manufacturing Co., Ltd., is creating another record. Its Aerial Photographic Department has only been in existence for three months and has already sold over a *Quarter of a Million* pictures.

Airco Aerials are the best in the world, because only the best Pilots, Machines, Photographers and Cameras are employed.

¶ **Have your factory photographed from the air.** The **Airco** will shew your Works to advantage.

¶ **See that an Aerial of the Municipality is hanging on the walls of the Council Chamber.** It will shew the Town *en masse*, in all its grandeur.

¶ **Your country house would make a wonderful enlargement.** An Airco Aerial will shew not only the building but the whole Estate.

¶ **Real photographic postcards** of all the **beauty spots in England as seen** from an **Airco** Machine.

On Sale in every Town.

Photographic Aeroplanes sent to all parts.

adequately wind screened. The design of the machine has been submitted to the Air Ministry and a certificate of airworthiness has been issued in respect of the machine.

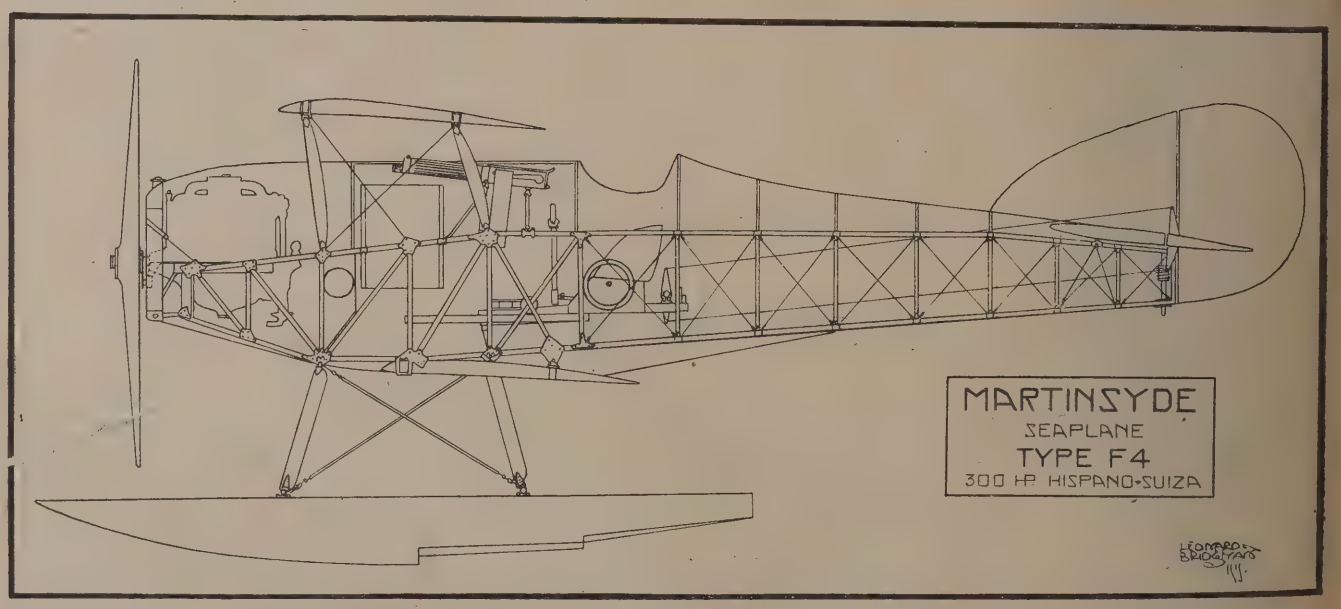
Throughout the design strength and permanence has been given the premier place, and no undue sacrifice has been made at the altar of cheapness, but in spite of this fact the price of the machine complete is only £500.

MARTINSYDE, LTD.

The Type "A" Martinsyde in its Australian guise.

The firm of Martinsyde, Ltd., needs little introduction to regular readers of this paper. Since the earliest days of British aviation they have occupied a foremost place amongst the ranks of British aircraft constructors.

During 1910, '11, '12, and '13 Martinsyde monoplanes held their place as the most graceful and most beautifully constructed of British aircraft, and their flying qualities were on a level with their construction.



During the war the Martinsyde "Scout," "Elephant," F.3, and the F.4—designed for war purposes, though the latter was not available till after the Armistice, thanks to engine supply difficulties—added to the firm's reputation.

Since the war the firm have produced the type A, designed for commercial transport work in various forms, and more recently the F.6.

The first machine of the F.6 type has but recently been completed. This machine is very similar to the F.4 in general design and appearance, except for one or two minor details in the arrangement of interplane and undercarriage struts. The machine is a two-seater and is fitted with a 300-h.p. Hispano-Suiza engine. Whereas in the F.4 the centre section struts slope outwards from the fuselage to the top centre section with the front pair of struts vertical, as viewed from the side, and the rear pair sloping down from the centre section towards the tail, in the F.6 all four struts are staggered in line with the other two pairs of interplane struts, and regarded from the front are vertical and parallel. Similarly, in the F.6, the interplane struts do not slope outwards but are parallel with the centre section struts.

In the undercarriage, instead of the struts forming the "Vees" being set at equal angles to the vertical, as in the F.4, the front pair of struts are vertical, while the rear pair are set back from the axle at an angle of 15 deg. There is no dihedral angle to the top plane, and a very slight one to the bottom plane. Many of the F.4s are being converted to two-seaters, extra room in the fuselage being provided by the removal of ammunition chutes, machine guns and fittings, and other "gadgets" extraneous to peace-time aeroplanes.

The attached table gives full particulars of the present-day products of the firm.

The Pioneers of British Aircraft Construction

invite you to inspect the latest types of "BRISTOL" Aircraft on **STAND 65** at the Paris International Aircraft Exhibition. Details of their exhibits will be given in these pages during this and succeeding weeks.

The "BRISTOL" Tourer follows very largely the lines of the renowned "BRISTOL" Fighter. Fitted with a 230/240 h.p. Siddeley "Puma" engine the Tourer has a speed of 120 miles per hour, and a range of 560 miles.

This machine is now being offered at the exceedingly low price of
TWELVE HUNDRED POUNDS.

NOTE.—F.6 can be produced either as a two-seater passenger or reconnaisance machine or as a single-seater fighter. When fitted as a single-seater the performance is similar to the F.4.
Both F.4 and F.6 as single-seaters can carry an additional load of 400 lbs., and bomb racks to take this can be supplied.

GEORGE PARNALL AND CO., LTD.

During the war the firm of Parnall and Sons of Bristol acquired an excellent reputation as manufacturers of aircraft to official specification, and so favourably impressed the powers that were with their workmanship that Mr. Harold Bolas of the Admiralty Air Department was released to them as a designer, and the firm was asked to undertake original design work.

At least one of their designs, the "Panther," reached the production stage—which, considering the late date at which they entered the designing field, and the difficulties attendant upon the production of a shipboard aeroplane, redounds distinctly to their credit.

The firm of Parnall and Sons has since then come under the proprietorship of W. and T. Avery, Ltd., and has definitely abandoned the production of aircraft.

Mr. Geo. G. Parnall has, however, organised the firm of Geo. Parnall and Co., and with the assistance of a personnel largely composed of those who conducted the aircraft department of Parnall and Sons, will carry on the business of aircraft designers and constructors.

At the moment the firm is occupied entirely with work on designs which have received the approval of the Air Ministry for military purposes, particulars whereof they are not at liberty to publish.

Mr. Harold Bolas is acting as the firm's designer, and Mr. Parnall is to be congratulated upon his courage and enterprise in initiating such a business at this time, and upon the success with which his efforts have so far been attended.

A RESULT OF PEACE.

An application was made to Mr. Justice Astbury in the Chancery Division on Dec. 2nd by the Sopwith Aviation and Engineering Co., Ltd., for sanction to alter the objects of the company in order to enable them to manufacture motor vehicles, all kinds of furniture, and other articles.

THE AIRCRAFT MANUFACTURING CO., LTD.

WITHOUT doubt, one of the most interesting exhibits at the Paris Salon, from an international standpoint, is that of the Aircraft Manufacturing Co., Ltd., Hendon, N.W.9. This firm is the producer of all the de Havilland machines that operated throughout the war.

Capt. de Havilland, O.B.E., A.F.C., R.A.F., the chief of the design staff, stands unique inasmuch as every type of machine built, for which he was responsible, has been a success. No other firm can boast of so many different successful machines. The de H.1, 1A, 2, 3, 4, 5, 6, 9, 9A, and 10 have all proved themselves formidable offensive weapons.

The reader might be tempted to ask what became of the de H.7 and 8. These machines were never built. Not that they would not have been a success if they had materialised, but because the urgent demand at that period of the war was for another type, and the de Havilland 9 had to be pushed ahead of them.

In the case of the Airco 16 machine, exhibited at the Paris Show, this is really a de Havilland 16 machine. Merely the name Airco (an abbreviation of Aircraft Manufacturing Co.) has been substituted, it being considered a better commercial nomenclature.

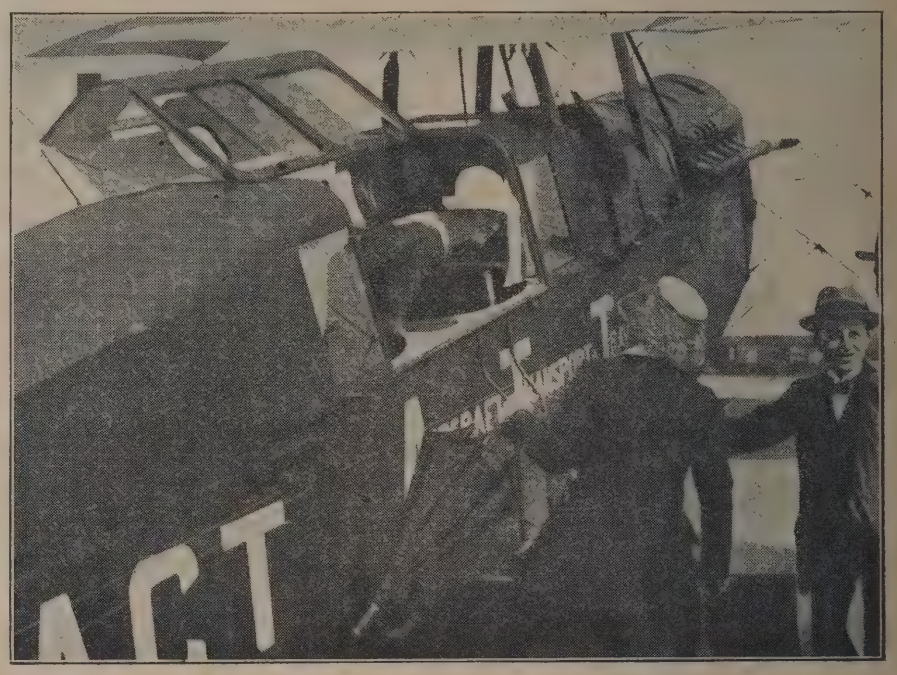
The public have an opportunity for the first time of inspecting the Airco 16 on this stand in its new form. In many respects it is like the well-known machine which flies daily between Paris and London. But a Napier "Lion" engine has been installed, and with the increase in horse-power one finds a corresponding and highly gratifying increase in its performance.

By reason of its somewhat unconventional shape the installation of the Napier engine has caused a modification in the general appearance of the nose of the machine.

An ingenious method of shielding the radiator (which is placed under the engine) has been embodied, the shutters following the line of the body so that, when closed, an uninterrupted flow of air is the result, save for a small projecting area deemed advisable for effective cooling even at great altitudes.

The success of the Airco 16 is only what should have been expected of it, because it is the outcome of the famous de Havilland 9A which distinguished itself to such a marked degree in the war. The 9A was not only used for reconnaissance and fighting, but as a long-distance, self-defending, daylight bomber, and this type carried thousands of tons of bombs over the Hun lines and dumped them on the Rhine towns. The 9A surely went a long way towards the downfall of the Boche.

As a machine possessing such high qualities as the 9A, but redesigned and turned to commercial use, the Airco 16 is daily proving its value by its constant journeyings to and fro on the London-Paris route in all weathers.



One has but to look up the Flying Intelligence Records of the Aircraft Transport and Travel, Ltd. (who have so far found nothing better for the work in hand than Airco machines) to realise its immense value as a peace-time air transport.

THE AIRCO 16 AT THE PARIS SHOW.

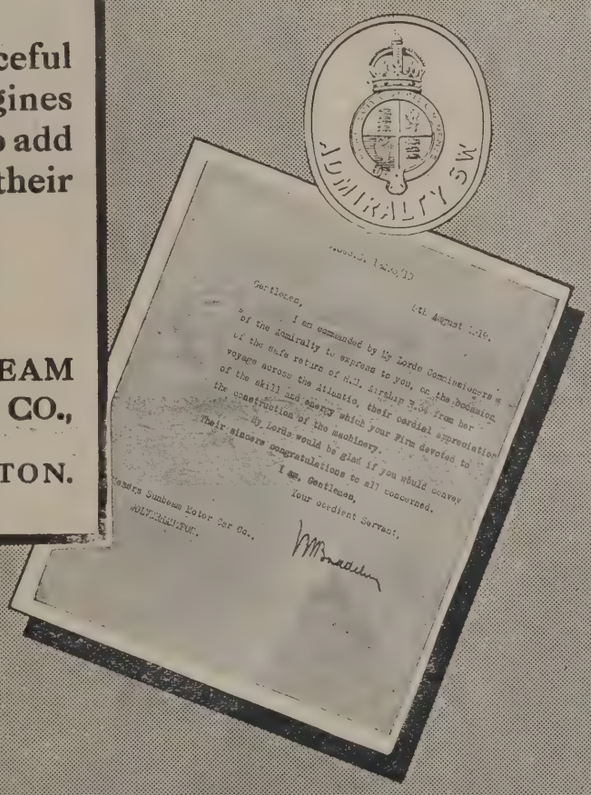
The fuselage, including the outside of the cabin, is enamelled white and is very highly finished. The cowling is polished aluminium. The usual V-type undercarriage is fitted and is painted black. The cellule and empennage are cream colour.

Almost all the fittings, including the long exhaust extension pipes, are nickel-plated. The remainded are black to match the undercarriage and tail-skid.

The cabin has almost a "boudoir" effect and is quite "futuristic" in its colour scheme—but at the same time it is quite practical and is furnished with durable material. Briefly stated, the top half of the cabin, which is hinged so that it will slide over for access and egress, is upholstered very similarly to a coach-built autocar, and is equipped with lighting set and a small circular trap-door for communicating with the pilot. Ventilation is afforded through holes in the roof, but the windows, too, are arranged to slide over one another so that they may be opened or shut from the inside.

Embarcation on an Airco 16.

So far as the cabin is concerned, comfort has been the



Side View of a Rolls-engined Airco 16.

SUNBEAM-COATALEN AIRCRAFT ENGINES

contributed in no small measure to the aerial supremacy which was largely responsible for the Victory which crowned the Allied arms.

And in peaceful times, these Engines will continue to add to the fame of their name.

THE SUNBEAM MOTOR CAR CO., LTD.,
WOLVERHAMPTON.

chief object in the mind of the designers. Black rugs and seats covered with a black material are provided, and bright peacock-green pillows. The lower sides of the machine are covered in a highly coloured ultra-modern scheme which, coupled with the pillows, gives just that touch of richness that befits a machine finished for exhibition purposes.

The cabin holds four persons, two looking forward and two towards the tail. By staggering the seats ample arm and leg room is provided; in fact, it can be safely asserted that so far as comfort is concerned it is ahead of the average automobile.

The machine is fitted with a two-way wireless telephony outfit by the Marconi's Wireless Telegraph Co., Ltd. With it the pilot can talk over a range of 100 miles and can receive audible messages up to the same distance. The weight of the outfit complete is only 60 lb.

The apparatus consists of:

(a) Generator.
(b) Aerial and winch.
(c) Remote control and transmitter.
(d) Receiver.

The generator is fitted conveniently on the port side of the machine, and is operated by means of a small windscrew.

From a geared winch, suitably mounted in the pilot's cockpit to facilitate winding, is fitted the trailing aerial. This can be let out at will, whilst receiving and speaking.

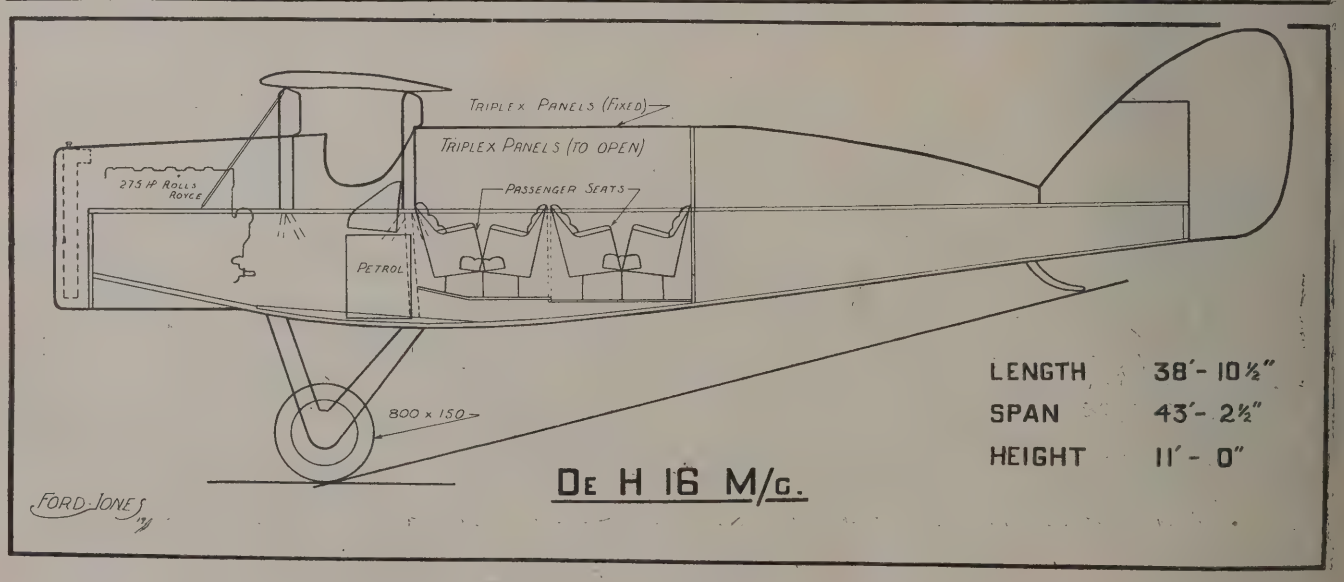
A control panel is fixed on the dashboard by means of which the pilot can tell that his set is radiating and also close the field of his air-driven generator supplying the high-tension circuit.

As a freight or mail carrier this aeroplane has still further advantages. Baskets have been designed and constructed which strap over in place of the movable top half of the cabin. The seats are easily removed and the "hold" so formed becomes a storage place for freight.

In addition to the white 16, the Airco displays a large model of the Hendon Aerodrome, showing their works.

View downwards into the cockpit of an Airco 16 Passenger-carrier.

A small section of the stand is devoted to aerial photography, a new branch of the firm's interests.



Here one not only sees many of the machines flying—as they were caught by the photographer in another Airco machine—but a few of the many views of places of historic interest and beauty are also exhibited.

The Airco photographic department is specialising in the photographing of factories from the air, and by so doing are enabling firms to get a more artistic and also more accurate representation of their works than the old conventional method of a very uninteresting sketch.

Owing to its vast resources, it is understood that the Airco have facilities for the manufacture of parts of any type of foreign machine, either experimental or in quantities, by special arrangement.

SHORT BROTHERS, LTD.

There was a time in the history of aviation in England when the terms "Short" and "seaplane" were almost interchangeable. The war impetus to the production of sea-going aircraft eventually led to the existence in fair quantity of seaplanes of other makes, but Short Bros. can always claim a very large share in the pioneer work of seaplane development, and their vast experience in this respect places them in a position to meet the needs of present day conditions.

For commercial work and civilian flying the seaplane stands at a considerable advantage as compared to the land machine at the present time.

In the first place there is no question of the preparation of chains of landing grounds, since the seaplane flying across water is itself an appliance equipped specially for alighting on that which is beneath it.

Secondly, war seaplanes have been developed with characteristics much more akin to those directly needed for commercial work than are those of the war aeroplane. Seaplane design has advanced further in the direction of providing machines capable of carrying large useful loads at reasonably high speeds over long distances with reasonable safety and reliability, and have not been afflicted by the necessity of an immense speed of climb and a high ceiling, and thus the war seaplane is more nearly a ready-made commercial machine than is its land-going equivalent.

Then, too, the seaplane has only to compete with shipping with a maximum speed of about 20 miles per hour, instead of with railway transport at a much higher speed, and can therefore save time at quite moderate flying speeds, and consequently at a low cost.

It is therefore not surprising that Short Bros are still devoting their attention to seaplane construction, and the "Cromarty" boat and the "Sporting" seaplane hereafter described may be considered as typical examples of practical commercial aircraft.

THE CROMARTY FLYING BOAT.

The Cromarty Flying Boat was originally designed for operating with the Fast Cruiser Squadron. This service necessitated its staying away from its base for long periods, consequently it possesses the following :—(a) Long range, i.e., big load capacity; and (b) great strength in order to be able to alight and rest in mid ocean.

These features make the machine specially suitable for commercial work, the former allowing for great variation in the load—range factor.

The latter feature is most important from the commercial point of view. The machine can not only take off and alight in rough water, but can safely be moored out in slightly protected harbours, thus economising greatly in shed accommodation, and particularly in labour for handling.

It will be noticed that this machine is extraordinary for its large load capacity, which is shown in the following table :—

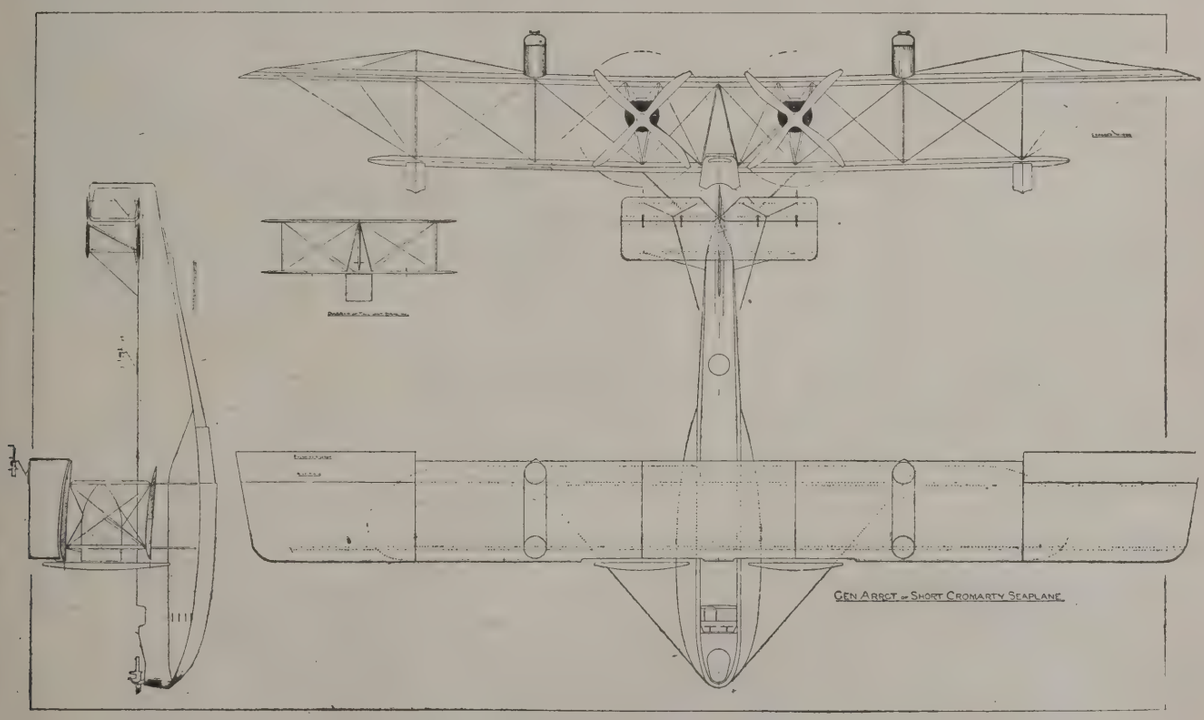
Range.	Duration.	Fuel per hour.	Economical speed.	Maximum commercial load.
270 mls.	3 hrs.	60 galls.	90 m.p.h.	*5,632 lbs.
540 mls.	6 hrs.	60 galls.	90 m.p.h.	3,796 lbs.
990 mls.	11 hrs.	60 galls.	90 m.p.h.	1,280 lbs.

*Crew of 3 only.

As a war machine it carries long-distance wireless, a big anti-submarine gun, and bombs.

In its commercial aspect the machine can be fitted to take passengers or freight. Arrangements have been made by which the passenger seating can be quickly removed, thus giving additional space for the carriage of goods.

The engines fitted are of the most reliable type, and the risk of engine failure is very small, provided proper care is taken of the engines.



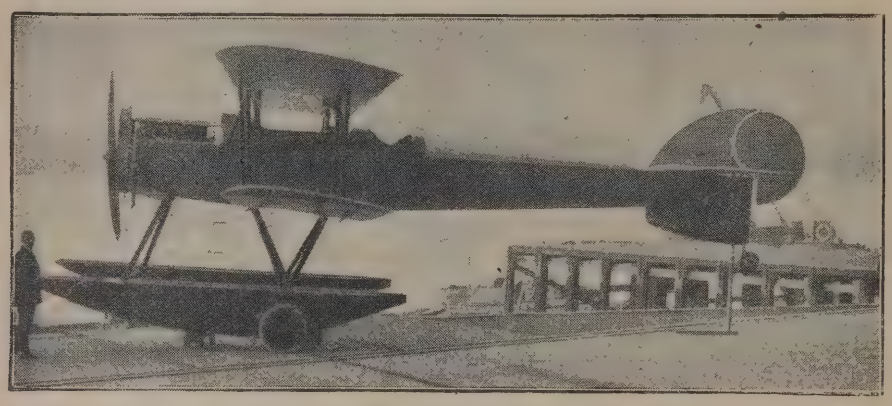
Great attention is also being paid to the comfort of passengers; the passengers' compartment will be heated, the engines will be silenced as much as possible, and a good view will be provided.

SPECIFICATION.

Type, "Cromarty" large twin-engined flying boat.
Engines, 2 Rolls-Royce of 600 h.p. each.
Span, 112 ft.
Length overall, 60 ft.
Height overall, 23 ft.
Crew, 5.
Probable full speed, 96 miles per hour.
Probable economical speed, 90 miles per hour.
Fuel Consumption :—
At full speed—Petrol, 77 galls. per hour
Oil, 8 galls. per hour.
At economical speed—Petrol, 60 galls. per hour.
Oil, 6 galls. per hour.
Load capacity, 7,708 lbs.
Fuel for 6 hours' flight at economical speed, 90 m.p.h. :—

Petrol (360 galls.)	2,592 lbs.
Oil (40 galls.)	360 lbs.
Reserve water (6 galls)	60 lbs.
Crew of 5	900 lbs.—3,912 lbs.
Available weight for passengers, etc.	3,796 lbs.
18 passengers at 160 lbs. each	2,880 lbs.
Luggage at 50 lbs each	900 lbs.—3,780 lbs.

Range under above conditions, 540 miles.



The Short "Cromarty" Flying Boat.

THE SPORTING TYPE SEAPLANE.

The Short Sporting Type Seaplane is designed as a general utility machine. The functions it will fill are numerous, and for convenience can be described under two headings—Military and Commercial.

MILITARY.—As will be seen from the specification, accommodation is provided for pilot and three passengers. The seating arrangements are: The two front seats are tandem fashion and are provided with dual control, the rear seats being side by side. Thus it will be possible to carry out tuition work not only in flying, but in gunnery, wireless, photography and bombing. For these latter, pilot, instructor and pupil can be accommodated, plenty of room being provided in the rear seats for wireless, guns or cameras. The view from the rear seat is excellent, and good arcs of fire are obtained. For the above work the machine is fitted with a 160 h.p. "Beardmore" engine, as a high performance is not required and economy in fuel is very necessary.

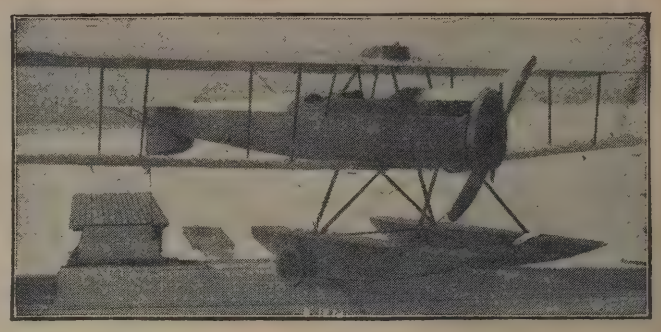
For war work, or where a high performance is desired, the Siddeley Puma engine of 240 h.p. is installed. This engine fits the machine without any alteration, this being one of the features of the design.

Side View of the Sporting Type Short.

The enormous advantage of having one machine and only one type of spare for tuition and war work is obvious.

By a neat arrangement of fittings, the seaplane chassis can be quickly taken off and a land chassis fitted in a few minutes.

COMMERCIAL.—The commercial values of the Sporting Type do not need explanation. For tuition, passenger work, or the transport of small quantities of freight the machine is most suitable.



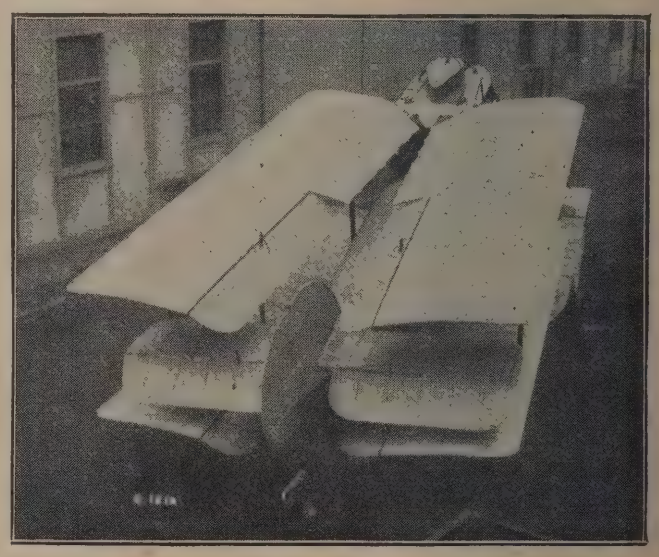
The machine is designed on the standard lines of the world-famous Short seaplanes, and therefore embodies all those important details of construction which have been evolved during seven years of hard experience.

The machine is made to fold into small compass by means of the Short Patent Folding Wing System, which permits the machine being housed in a shed of very small dimensions.

To beach the machine an axle is passed through prepared holes in the floats, wheels are attached each end, and the machine can then be handled by two or three men with great ease.

SPECIFICATION.

Type of machine: Short Sporting Type Seaplane.
Engine, 160 h.p. "Beardmore."
Maximum power, 200 h.p.
Fuel capacity: Petrol, 35 galls. (3 hrs. flight).



The Sporting Type Short (160-h.p. Beardmore engine).

Oil, 3 galls
Dimensions: Span, 44 ft.; span, folded, 15 ft.; length, 33 ft.; height 12 ft. Total surface, 500 sq. ft.
Loading: 6.2 lb. per sq. ft.—15.5 lb. per h.p.
Passengers and crew: 1 pilot and 3 passengers.
Range: 270 miles.
Weights: Total weight, 3,100 lb.

Weight, empty	2,095 lb.
Petrol	255 lb.
Oil	30 lb.
Water	80 lb.
Pilot	160 lb.
Passengers and freight	480 lb.
	3,100 lb.

Performance: Speed, 83 m.p.h.; climb, 10,000 ft. in 35 min.

Short Bros., in addition to their seaplane productions, have now taken over the patent rights for Lt.-Colonel Busteed's emergency flotation gear.

The Sporting Type Short, with Wings folding.

THE B.S.A. AND DAIMLER COS.

It is, of course, never safe to suggest that "everyone knows" anything—however much a matter of widespread notoriety that thing may be—and doubtless there are those who do not know that it is in the main to the B.S.A. concern, and to their enterprise in taking up the manufacture of the Lewis gun, that the British Air Services owe this very useful weapon.

Even were this their only claim to have assisted in the development of British aeronautics, it would still entitle them to fame in that sphere, but a detailed account of the work of this and the associated concern of Daimler, Ltd., reveals that their faculty of organising the efficient manufacture of intricate parts in large quantities had a much more direct influence on the growth of British Air Power during the war.

One startling performance—due to the Daimler Co.—occurred at the very beginning of hostilities. On Aug. 7th, 1914, the Daimler Co. agreed with the Gnôme Engine Co. to undertake the manufacture in England of the 80-h.p. Gnôme engines. There were no drawings or specifications—merely a sample engine sent by road from Hendon to Coventry, to be dismantled, measured, drawn down and the components analysed.

Within eight weeks—on September 31st—the first engine was running on the test bench.

Later the R.A.F.1a, R.A.F.4, the 110 Le Rhone, and the 230 b.h.p. engines were in turn tackled by the Daimler Co. and the B.S.A. Co., and the difficulties of production overcome with the same whole-hearted zeal.

Aeroplanes of numerous types were similarly put in hand, of types ranging from the B.E.2c to the De.H.10, and with equally successful results.

During the same period the output of service rifles, ammunition, shells, automobiles, tractors, tank power plants, and many other war-time essentials were manufactured in huge and ever-growing quantities, and the work of these two associated companies affords irrefutable evidence that this country is capable of the organisation and management of works on the largest scale.

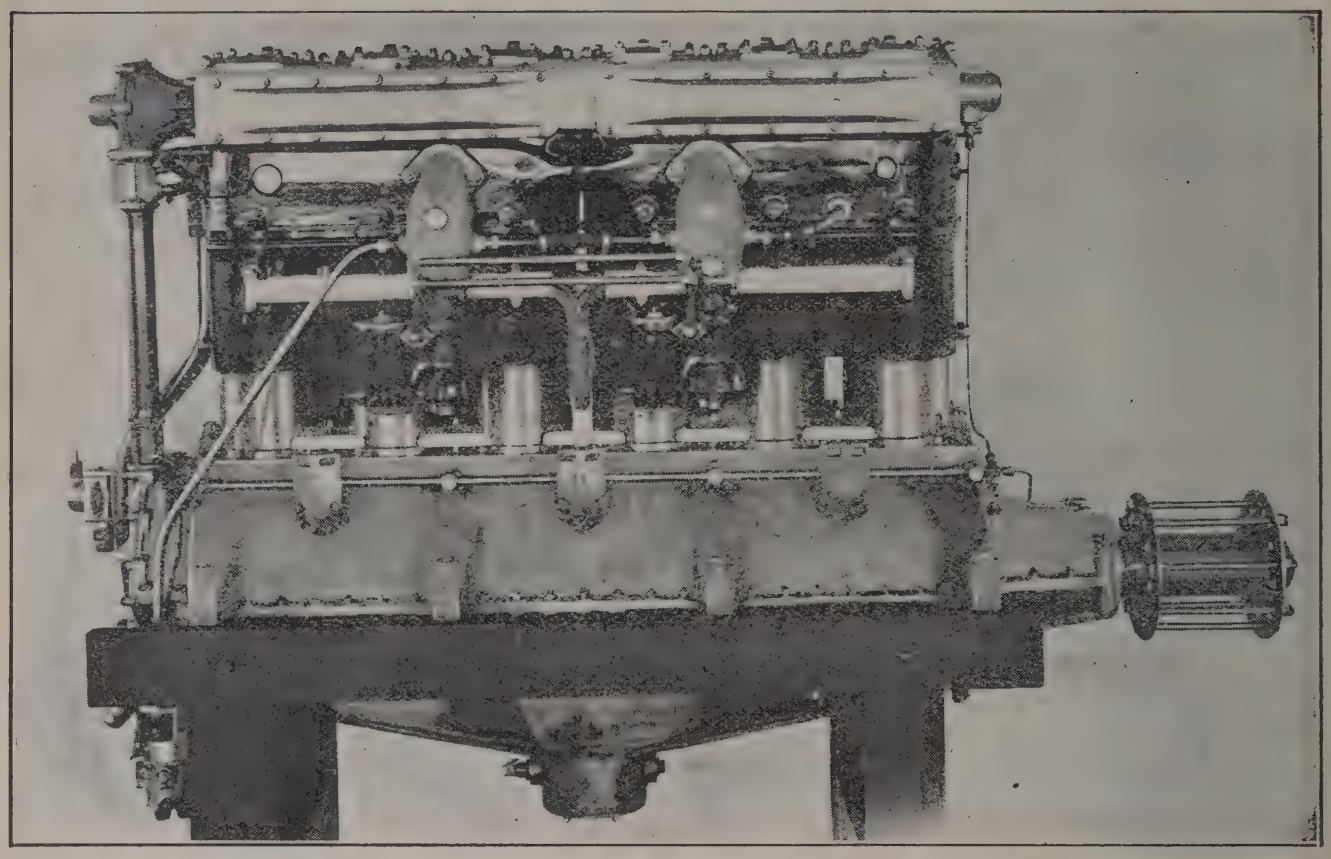
The great Australian Flight was started and finished on "SHELL" AVIATION Motor Spirit

Captain Ross Smith's magnificent and epoch-marking flight of 10,925 miles in 27 days, 20 hrs., 20 mins., which, in the words of the King, "will bring Australia nearer," was accomplished on a Vickers - Vimy Rolls-Royce Eagle-mark VIII —the identical type of machine used by Captain Sir John Alcock in his historic flight across the Atlantic, "SHELL" AVIATION Motor Spirit having been used by both aviators.

The Australian Government's prize of £10,000 thus won by Captain Ross Smith makes the fourth prize of £10,000 to be won on "Shell," the preceding three being:—

"Daily Mail" £10,000 Prize, London-to-Manchester Flight, Won by Paulhan in 1910, on "SHELL" Spirit.

"Daily Mail" £10,000 Prize, Circuit-of-Britain Flight, Won by Beaumont in 1911, on "SHELL" Spirit.



"Daily Mail" £10,000 Prize, America-to-Europe-direct Flight, Won by Capt. Alcock in 1919, on "SHELL" AVIATION Spirit.

ALL Prizes in the 1919 Aerial Derby were won on "SHELL" AVIATION Motor Spirit.

A limited quantity of "SHELL" AVIATION, the Motor Spirit de Luxe, is now available for private motorists. It is sold *only* in the ALL-GOLD CANS. The supremacy of "SHELL" AVIATION Spirit on the world's Aerial Highways establishes beyond all question that "SHELL" AVIATION is the most powerful and dependable motor spirit in existence.

The original 230-h.p. B.H.P. "Adriatic" Aero Engine. (Inlet Side).

The original design of 6-cylinder water-cooled B.H.P. engine was produced by Major (then Captain) F. B. Halford, in collaboration with Sir William Beardmore, Bart., and Mr. T. C. Pullinger (managing director of Arrol-Johnston and Co., Ltd.). The work was started in the Spring of 1916, when the situation on the Western Front made it vital that the Royal Flying Corps should have machines with engines of considerably higher power than had been used to that date. TRADE MARK

"Supreme in Power for Weight."

The B.H.P. "Atlantic" Engine of 500 h.p., built by the Galloway Engineering Company, of Dumfries, Scotland.

Germans had adopted the 6-cylinder type of engine as their standard, the only engine of the same type which had been consistently used by the British Flying Services up to that time, was the 120-h.p. Beardmore.

As the situation was serious, it was considered that there was insufficient time to design and try out and produce an entirely new design of engine. Arrol-Johnston and Co., Ltd., then set to work to modify the 120-h.p. Beardmore to give over 160 h.p., as it eventually did. This latter engine completely replaced the 120-h.p. and has done extraordinarily good work on long-distance bombing and reconnaissance machines.

A new company, the Galloway Engineering Co., Ltd., was formed to exploit the new B.H.P. engine, and a new factory was built to assist its production. The size of the cylinder proposed, i.e., 145 mm. bore, was considered by many to be too large to embody in a 6-cylinder engine, but, as has been happily proved, the critics proved wrong.

The first engine was running in June, 1916, and after satisfactory non-stop endurance tests on the bench, was fitted into a D.H.4 aeroplane, which had been specially designed for the engine by Capt. Geoffrey de Havilland, of the Aircraft Manufacturing Co.

The results in the air with this combination proved extremely satisfactory, in that although the best performance of this type of machine had been approximately 95 m.p.h. the D.H.4 resulted in 115 m.p.h. at 1,000 ft.

The machine was officially tested by the Central Flying School and decision made by the authorities to order the engine in larger numbers than had been proposed before with any other type.

Realising the facilities that would be required to produce 100 engines per week and spares, which was the figure suggested, and in view of the important part played by the Beardmore engine (which occupied the whole production of Arrol-Johnston and Co., Ltd.), Siddeley-Deasy, of Coventry, were asked to take over the production of the B.H.P. and to take such steps as would ensure the maximum output per week.

Although this firm was only then producing some 25 to 30 engines per week, the results of their efforts are best realised when it is stated that at the time of the Armistice the production of Siddeley-Deasy's works of the B.H.P. engine, better known as the "Puma," was equivalent, including spares, to 200 engines per week.

The engine was made the standard 6-cylinder water-cooled used by the Royal Air Force, and has been consistently used by the Independent Air Force in the bombing of Rhine towns.

Before the aluminium cylinder block reached the satisfactory stage the Galloway Engineering Co., Ltd., tried out a cast iron construction, in order to ensure engines being turned out in the quickest possible time. This type was dropped when the Siddeley engines reached the production stage.

Realising again the necessity for considerably higher powered engines, the Galloway Engineering Co., Ltd., set to work to design and produce a 12-cylinder b.h.p. engine.

To eliminate as many experimental features as possible a double B.H.P. was made, incorporating two pairs of cylinder blocks with cast iron construction. This engine was known as the "Atlantic" B.H.P. and gave 500 h.p. at 1,500 r.p.m.

As in the case of the 6-cylinder B.H.P. no gear reduction was fitted, and the fact that the weight per h.p. of 2¼ lb. was obtained with an engine running at only 1,400-1,500 r.p.m. was very creditable. This engine, the "Atlantic," was tested out on the bench, and also flown in another of the Aircraft Manufacturing Company's machines, the D.H. 9A, which was designed for the "Liberty."

A short time before the Armistice when it became imperative that a high power engine should be standardised for bombing machines, one of the engines chosen for mass production was the "Atlantic"; but for production purposes as the "Puma" cylinder blocks were then on a satisfactory production basis and being turned out in very large numbers, it was decided to pool the resources of several of our largest firms in the mass production of the engine, which was then rechristened the "Siddeley Pacific." Some thousands were ordered, and but for the Armistice no doubt would have been produced. It is thus interesting to see the order in which the four engines came forward.

THE 230-h.p. SIDDELEY "PUMA."

ENGINE DATA.

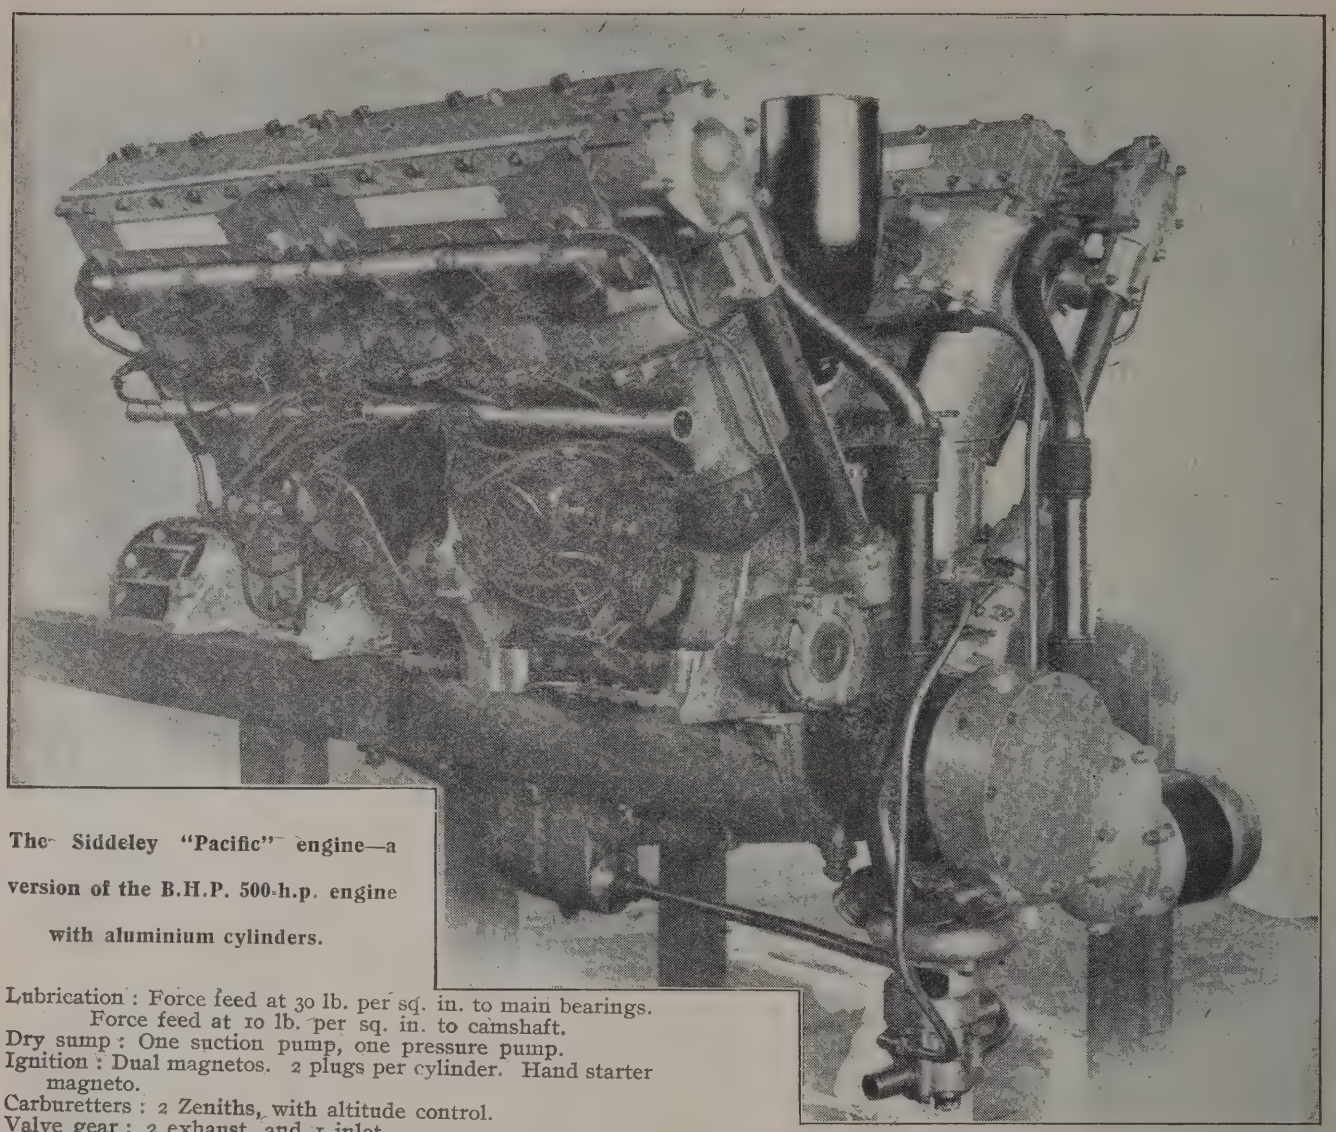
Type : 6-cylinder water-cooled vertical. Aluminium, with steel liners.
Bore : 145 mm.
Stroke : 190 mm.
Horse-power : 230 at 1,400 r.p.m.
Weight (dry) : 680 lb. (including airscrew boss, carburetters, magnetos, etc.).
Fuel consumption : 0.55 pints per b.h.p. hour.
Oil consumption : 0.025 pints per b.h.p. hour.

Beardmore

MANUFACTURERS!

If you wish to see Aeroplanes multiply like Cars, consider the BEARDMORE AERO ENGINE.

Consider the opinions of men whose lives have depended on BEARDMORE RELIABILITY.



Extract from letter from Sydney, N.S.W.

"Whilst on Active Service and also whilst instructing in the Royal Air Force, I came in contact with your Aero Engines constantly, and after 2,000 hours I have never once had trouble with a Beardmore Engine."

Many leading Aircraft Manufacturers are already adopting the BEARDMORE as STANDARD POST-WAR POWER UNIT.

AeroEngines

The Siddeley "Pacific" engine—a version of the B.H.P. 500-h.p. engine with aluminium cylinders.

Lubrication : Force feed at 30 lb. per sq. in. to main bearings.
Force feed at 10 lb. per sq. in. to camshaft.
Dry sump : One suction pump, one pressure pump.
Ignition : Dual magnetos. 2 plugs per cylinder. Hand starter magneto.
Carburetters : 2 Zeniths, with altitude control.
Valve gear : 2 exhaust, and 1 inlet.

Camshaft set *désaxé*, operating direct on exhaust valves and by overhead rockers to inlet valves.

THE 500 H.P. B.H.P. "ATLANTIC" AERO ENGINE.

SPECIFICATION.

Bore	145 mm.
Stroke	190 mm.
Normal b.h.p.	500
Direction	Right hand tractor.
Petrol consumption per b.h.p hour	0.588 pints
Oil consumption per b.h.p. hour	0.060 pints
Weight (dry)	1,210 lb.
Weight per b.h.p. (dry)	2.42 lb.
Weight in running order with 6 hours fuel and oil	3,508 lb.
Weight per b.h.p. ditto	7.02 lb.
Compression ratio	4.9 :1.
Maximum lift of exhaust valve	12 mm.
Clearance of inlet tappet	0.25 mm.

ROLLS-ROYCE, LTD.

Rolls-Royce aero engines need little introduction to the readers of this paper. Their work during the war, when they proved themselves unequalled amongst all the high-power engines produced either by the Allies or the enemy, and their achievements since the conclusion of hostilities, from flying the Atlantic to carrying on the London-Paris air service, provide conclusive testimony to their merits.

The Australian flight of Capt. Ross Smith adds further testimony to the capacity of these engines to stand up to hard work.

At the present time Rolls-Royce, Ltd., state that they are only manufacturing their "Eagle" type of engine for sale commercially. Whether this is to be taken as meaning that the "Falcon" is to be abandoned is not quite clear, but it is to be hoped that it merely indicates that manufacturing facilities are not yet equal to the demand for this type.

The Rolls-Royce "Eagle" engine is the type so largely employed on the Handley Page and Vickers "Vimy" bombers and upon the famous "F" boats during the war. Up to the date of the Armistice of 122 Handley Page bombers which had been built, 113 were equipped with Rolls-Royce engines.

The "Eagle" engine has been fairly fully described in past issues of THE AEROPLANE, but some recapitulation of its characteristics may well be indulged in.

The engine is of the 12-cylinder Vee type, with a bore of 4½ in. and a stroke of 6½ in., giving a normal output of 330 h.p. at 1,650 r.p.m. and a maximum output of 360 h.p. at 1,800 r.p.m. The cylinders are of steel, fitted with overhead valves set in two rows of six with an intervening angle of 60 degrees upon a crankcase of cast aluminium.

The valves are operated through rocker arms by one overhead camshaft to each row of cylinders. Each cylinder forms a separate unit, and is fitted with an independent welded on sheet steel water jacket.

The connecting rods are of the articulated type, and there is therefore only one big end on each throw of the six-throw crankshaft.

The airscrew end of the crankshaft carries a gear ring with external teeth, which drives the airscrew shaft through an epicyclic reduction gear with a ratio of 1 to 0.6.

Forced lubrication is naturally employed throughout, and arranged on the dry-sump principle, wherein two oil pumps are employed. One of these pumps, of somewhat greater capacity than the other, removes the used oil from the crankcase sump and returns it to the oil tank to cool, the second pump forcing oil from the tank to all the bearings.

Four 6-cylinder magnetos supply current to two plugs in each cylinder, and the ignition system is thus completely duplicated.

Very great attention has been paid to securing economy of both fuel and oil, and the petrol consumption at 330-h.p. is only 0.21 gallons per hour.

The engine complete with airscrew hub, hand-starting gear, magnetos, reduction gear, but without exhaust manifolds, radiator oil or water is 900 lb.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

THE COSMOS ENGINEERING CO., LTD.

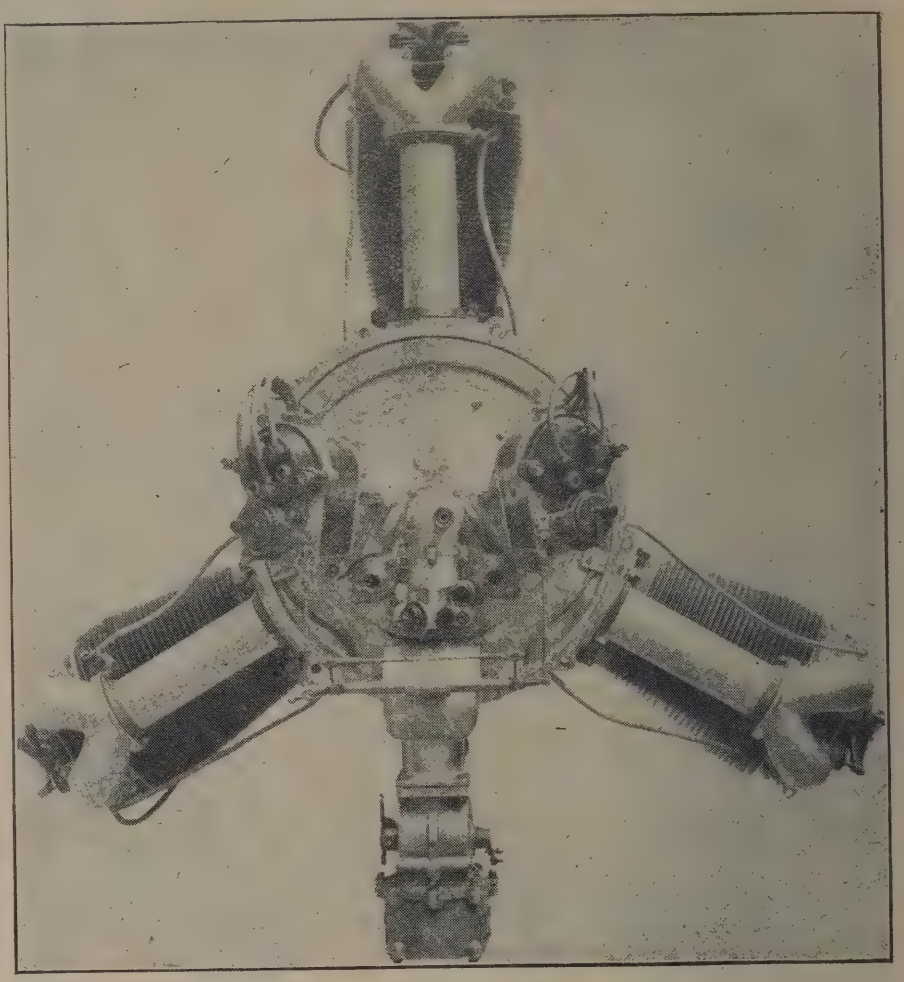
The Cosmos "Mercury" engine of 315 h.p. and the "Jupiter" of 450 h.p. are already fairly well known in the world of aviation, and have been fully described in the pages of THE AEROPLANE.

The Cosmos "Lucifer"—an engine designed specially for use in commercial and pleasure aircraft of moderate power—will make a public appearance at the Paris "Salon Aeronautique," which opens on Dec. 19th.

This engine is designed to meet the requirements of the low power, low cost, aeroplane power unit.

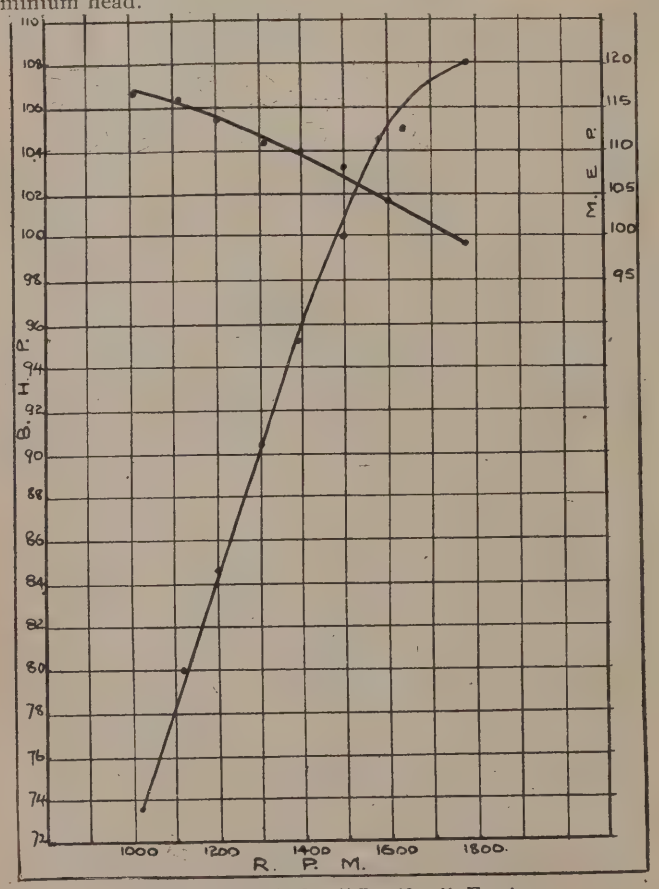
In considering the design, careful attention has been given to reliability and long life, combined with low cost and ease of production.

The "Lucifer" engine is a 3-cylinder inverted "Y" type radial engine, of moderate performance. There has been no attempt to cut weight or obtain the maximum performance from the engine, and the number of parts has been reduced to the minimum and to the simplest design possible embodied compatible with sound mechanical principles.



The engine may be relied upon to run for long periods without overhauling or dismantling from the aeroplane, and the general all-round performance and reliability are comparable with the modern motor-car engine.

The engine is rated at 80 h.p. : 100 h.p. at 1,600 r.p.m. is guaranteed with a moderate m.e.p.



The main features of the engine are as follows :—

CYLINDERS.—Three cylinders, bore [illegible] in., stroke 6¼ in., radially disposed, arranged as an inverted "Y."

The cylinders are air-cooled, being a combination of aluminium and steel, and embodying the Cosmos patent aluminium head.

The Cosmos "Lucifer" Engine of 80 h.p.

Power Curve of the "Lucifer" Engine.

VALVES AND TAPPET GEAR.—Overhead valves are employed, operated by push-rods arranged on the front side of the cylinders.

CRANKCASE.—The crankcase is a simple circular aluminium casting, and the engine is attached to the fuselage of the aeroplane by a circular flange situated at the back of the case.

AIRSCREW SHAFT AND HUB.—The airscrew runs at engine speed of 1,600 r.p.m. The airscrew shaft is integral with the crankshaft. The airscrew hub is standard Air Board design, and is attached to the airscrew shaft by means of serrations and a taper.

CRANKSHAFT AND CONNECTING-ROD ASSEMBLY.—The crankshaft is a one-piece solid forging. The connecting-rods are of "H" section, and the big-end bearings are lined with white metal, run direct into the big end of the rod.

IGNITION.—Dual ignition is fitted, the generator and distributors being driven off the back-end of the engine. The distributors are in an accessible position.

PISTONS.—The pistons are of the modified slipper type, with three rings at the top and a scraper ring at the bottom

LUBRICATION.—Two oil-pumps are provided, one scavenging and one suction, oil being fed, under pressure, from the crankshaft. The filters are so arranged that they may be withdrawn for cleaning purposes from the front-end of the engine, and an adjustable oil relief valve is provided

INDUCTION SYSTEM AND CARBURETTER.—A circular induction system is fitted to the three cylinders at the back of the engine. One carburetter feeds the three cylinders, the branch pipe from the carburetter to the circular ring being provided with an exhaust-heater.

STARTER GEAR.—The engine will be provided with a starting-handle, which may be operated from the pilot's cockpit.

WEIGHT AND PERFORMANCE.—The normal rating is 80 h.p., with a maximum b.h.p. of 100 at 1,600 r.p.m. The total weight of engine, all on, is 280 lbs.

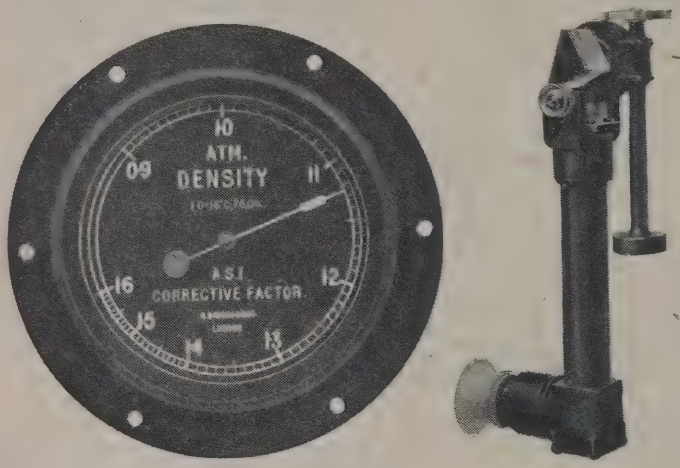
"GWYNNE, LONDON." "HAMMERSMITH 1910."



S. SMITH AND SONS (M.A.), LTD.

From Left to Right.—The Smith Recording Altimeter, the Smith Statoscope, and the Smith Petrol Gauge.

S. Smith and Sons (M.A.), Ltd., were established in 1899, and their first speedometer was manufactured and assembled for the late King Edward. With the resultant demand for this fitment, S. Smith and Sons, Ltd., built up their business and expanded their premises, until at the present day they stand as one of the largest manufacturers of instruments for use in the motoring and aviation industries.

During the late war their whole output was earmarked for the production of instruments and fittings of precision for the British and Allied Services. They claim that they supplied more aviation instruments for the British and Allied Governments than any other maker. In addition they produced upwards of eight million fuses, besides a vast number of their standard speedometers and carburetters, together with gun mechanisms and other sundries.

The Smith Atmospheric Density Gauge and the Baker Air Sextant.

It is only natural then, with their wide and successful use in the war, that their instruments will be and are being used by mose of the largest aircraft firms, as well as by the Services at the present time. It is interesting to note that both the Sopwith and the Vickers "Vimy" machines used in the first unsuccessful and successful direct flights across the Atlantic, respectively, as well as on the Alliance machine that flew from London to Madrid non-stop used Smith instruments, and the Hughes sextants (for which S. Smith and Sons, Ltd., are sole agents) were used on the R.34 on its American voyage.

The range of aviation instruments they make include the Smith revolution indicator (flush fitting model, bracket fitting model, both of which can be fitted with a counter to give the number of revolutions up to a hundred million revolutions), all types of revolution indicator drive and gear-boxes, the Smith air speed indicator (Clift's patents), the Smith recording air speed indicator, the Smith atmospheric density gauge, the Smith altitude recorder, the Smith wristlet and pocket altimeters, the Smith maximum registering aneroid (also in a pocket edition), the Smith recording altimeter, the Smith statoscope, the Smith anemometer, Smith aviation clocks and watches, the Smith manometer (Clift's patent), the Smith petrol gauge (Clift's patents), the Smith kite balloon winch indicator, the Smith tankometer, the Smith chronoscope or "time of flight" instrument, Smith clinometers (lateral and longitudinal), gradometers, chronometers, thermometers, all types of aviation compasses, the Baker air sextant, signalling lamps, safety-belts, etc., etc.

The Smith petrol gauge (Clift's patent) is an accurate and reliable gauge for recording the amount of fuel in the tanks of aeroplanes and airships. The advantage of this gauge is that it can be fitted with a dial at any distance from the tank, so that it is particularly adaptable for both airships and large aeroplanes where the tanks are a considerable distance from the cockpit. Two pipes, one leading from the bottom of the tank and one from the top are connected to the instrument. By ejecting the petrol from the bottom pipe, by a small rubber bulb, the difference in the pressure in the two pipes will give a reading on the dial indicating the number of gallons in the tank.

The Smith atmospheric density gauge is the first instrument of its kind ever put on the market and used in conjunction with the air-speed indicator gives the corrective factor for the various heights whilst in flight. The instrument is calibrated in numbers, which when multiplied by the m.p.h. shown on the ordinary air-speed indicator, give the actual air speed.

The Smith statoscope is simply a very sensitive form of atmospheric gauge indicating a rise or descent of ten feet or even less. It consists of a chamber with a short length of rubber tubing attached. The end of the tube is open to the air, and, therefore, the air contained in the chamber will remain at atmospheric pressure. If, however, the rubber tubing is squeezed, while the machine is climbing, the ascent will be indicated on the dial. This is due to the fact that while the air-pressure in the chamber will remain constant, the pressure of the surrounding atmosphere will have decreased if the machine is climbing, and will exert less pressure on the outside of the diaphragm, which constitutes one side of the air chamber. The air imprisoned in the chamber will, therefore, tend to expand the diaphragm, which is attached to the pointer by suitable recording mechanism.

The Baker air sextant (for which S. Smith and Sons (M.A.), Ltd., are sole agents) has been specially designed for air recording work. The altitudes are taken in the usual way by means of a prism fitted with an adjustable sunshade attached to a centre plate, or worm, which is adjusted by means of a knurled screw with a micrometer head. The back and front horizons are reflected in the same field as the celestial object, and a very rapid and accurate observation can be made. The focussing of the instrument is carried out by simply rotating the knurled band on the lens mounting.

The Smith wristlet and pocket altimeters are both extremely well-made and compact little instruments, and can be obtained to register either to 15,000 or 30,000 feet in the wristlet pattern, and 10,000, 15,000 or 30,000 feet in the pocket pattern, which also has a weather indicator on the dial, as illustrated.

Above: The Smith Pocket Altimeter. Below: The Wristlet Edition of a similar instrument.

S.B.A.C. THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

THE WORK OF THE MARINE EXPERIMENTAL AIRCRAFT DEPOT, ISLE OF GRAIN.—(*continued.*)

BY CAPT. W. H. SAYERS, LATE R.A.F.

The successful "ditching" tests on the "Pup" led to the consideration of similar arrangements for two-seater machines, and it was decided to experiment with a Sopwith "one-and-a-half strutter."

The design of flotation gear developed for this machine, although based on the same principles as that for the "Pup," was very considerably modified.

In the first place the dropping chassis was regarded with distrust. A chassis which fell off on pulling a string might conceivably drop off on occasions when it was not required to do so. On the other hand it was fairly well known that the ordinary landing gear set up a very great upsetting moment when it struck water, and that the actual water resistance of the wheels provided a considerable portion of this upsetting moment.

It was decided, therefore, to add to the chassis a forward member, carrying at about the normal axle level a planing surface which on touching water would give a supporting moment ahead of the C.G.

It was also decided to discard the landing wheels before touching the water.

At the same time it was decided to take advantage of the considerably greater forward protrusion of the fuselage and engine mounting in the two-seater machine by using the fore end of the machine to support longitudinal air bags at each side of the fuselage instead of the wing bags used on the "Pup." To the top of the forward strut of the chassis Vee on each side was affixed a wide plank strut projecting forward and down to the level of the wheel axle, and carrying at its lower extremity a miniature biplane, built of wing section duralumin plates of 6 in.-chord, and having an overall span of about 5 ft.

The lower wing of the biplane was given a marked dihedral angle to give gradual entry into the water.

Steel tube struts running back to the bottom of the Vees took the water undercarriage drag loads, and the biplane arrangement adequately tied the two struts laterally.

The end of the wheel axles were cut off short outside the shock-absorber fittings, and the wheels were mounted on stub axles, pressed into the tube axle against coiled springs and locked in place by a tapered steel pin, which could be pulled out from the pilot's seat by a cable attached to a lever in the cockpit.

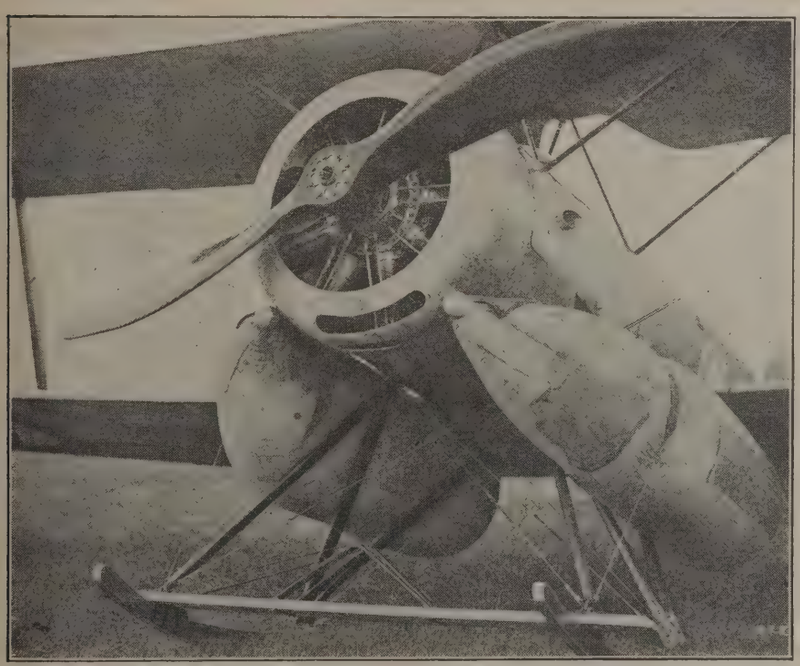
Along the lower edge of the fuselage on each side a pair of angle boards, clipped to the chassis struts forward and supported beneath the wings, were attached.

Emergency Flotation Gear fitted to a DeH.4. Note the biplane Hydrovane.

The air bags, cylindrical amidships with a pointed fore end and a hemispherical stern, were stowed into the corner of the angle boards, to which they were firmly attached by fabric flaps cemented to the bags, and clamped to the boards by screwed-on laths.

When uninflated the bags were rolled up and clipped into a fabric flap and buttoned to the angle boards, and the total end on area of the structure was only about 4 sq. in. of bag, and the edges of the boards—each about 10 in. by ½ in.

This arrangement of bag had the advantage of not interfering in the least with the controllability of the machine—as even with the bag on one side inflated, or partly inflated, and that on the other stowed, there was no appreciable effect on the controllability of the machine in the air.



With the earlier arrangement of bags under the leading edge of the wing, failure of one bag to inflate owing to a blocked pipe, or to the sticking of the retaining flap, would have put the machine completely out of control.

This first one-and-a-half strutter flotation gear was in general arrangement similar to that shown attached to a DeH.4 in the photograph above.

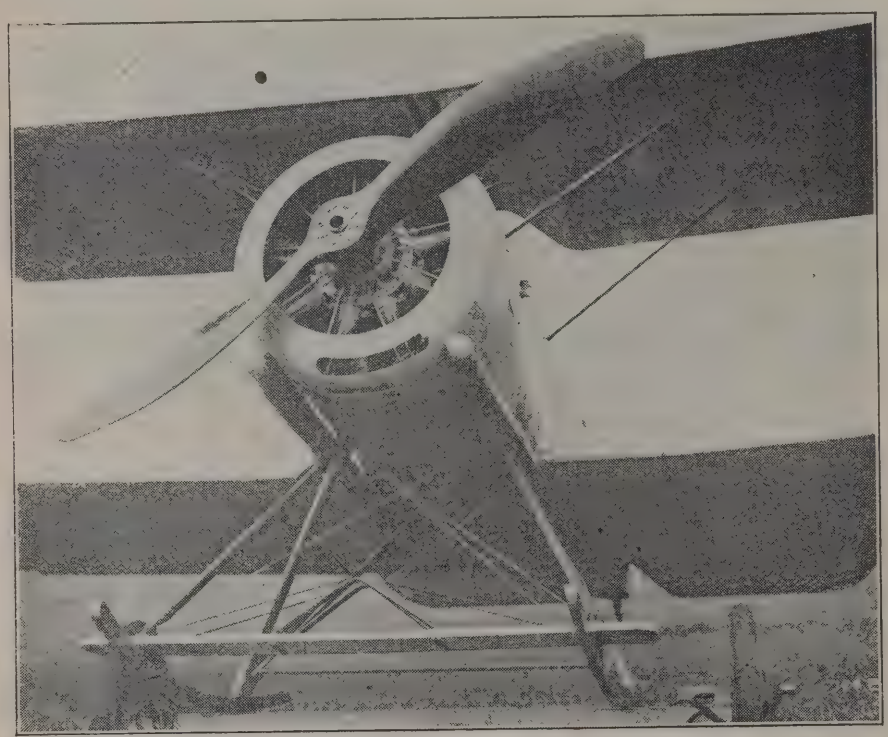
Tests made on the 1½-strutter were very successful. The bags inflated or otherwise made no noticeable difference to the handling of the machine. It was therefore possible for the pilot, having decided to land in the water, to inflate his bags, release his wheels, and so forth, at leisure and at a reasonable height, and to fly while he assured himself that all was ready.

On one early test a pilot discovered that the wheel ejecting gear had failed on one side, and flew round for some minutes at 1,000 ft. with bags fully inflated while he sideslipped at intervals till he had removed the offending wheel.

At the request of the French authorities a standard Voisin bomber was fitted by Port Victoria with an emergency flotation gear, and for this

"One-and-a-half Strutter," with flotation bags inflated. This machine is fitted with skid chassis and a single wooden hydrovane.

machine air bags along the lower wings were used.



In the first installation these bags were made to extend over only about half the wing span. This led to too high a loading on the front spar when afloat, and resulted in severe buckling of the steel tube spar on landing. Bags of smaller diameter extended to the outer row of interplane struts were therefore fitted, with satisfactory results.

Hydrovane surfaces for alighting were provided first by covering in both axles with a three-ply casing of wing section, but eventually only the front axle was so fitted.

The Voisin, piloted by M. Bonnet-Labranche, made a colossal splash on striking the water, but was successfully induced to float right side up and undamaged.

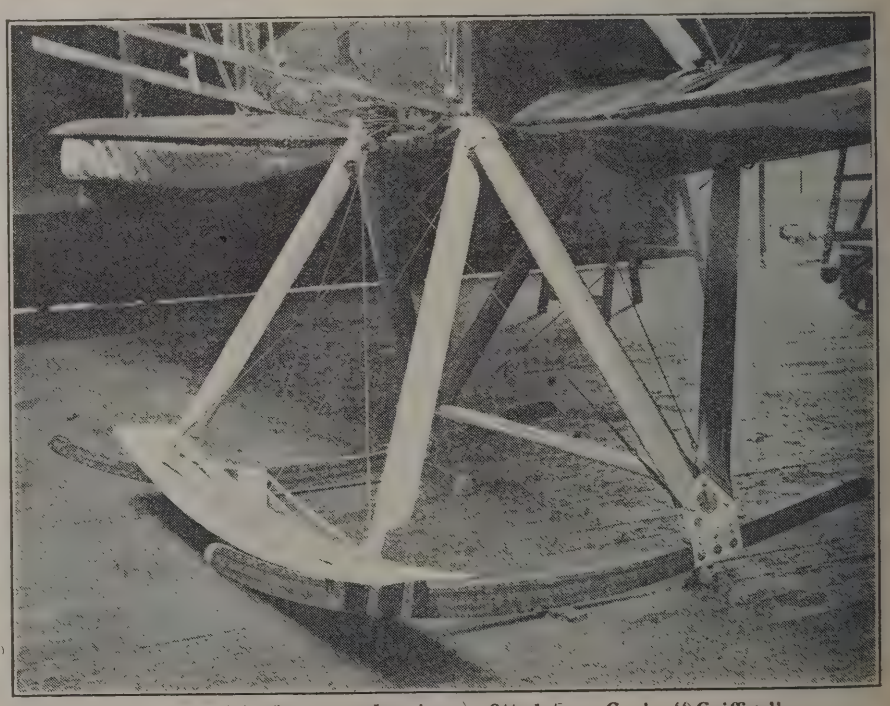
A "One-and-a-half Strutter," with Flotation Gear, after alighting.

"One-and-a-half Strutter" Flotation Gear, bags stowed on side rods.

A later development was the continuation of a skid chassis with the emergency landing gear. This was fitted first to a Curtiss J N.4 for experimental purposes and later to 1½-strutters.

Difficulties in the supply of the profiled duralumin for hydrovanes led to the substitution of wooden hydrovanes, which were found to operate equally well, and the original biplane arrangement was abandoned in favour of a single plane fitted with a king-post bracing.

On the D.H.4 whose flotation gear is illustrated a compressed air device was used to blow the landing wheels off before alighting, this being operated automatically by the act of turning air onto the air bags.



Certain F.E.2ds were also fitted with flotation gear on exactly similar lines. In this case the wheels were cast adrift in a very simple manner. Instead of slinging the wheel-axle above the skid, the axle was placed under the skid and held on by a catch of the sliphook type which was released by a cable pulled by the pilot and allowed the whole axle to drop clear.

The essential feature of the flotation gear was the method adopted for inflating the air bags. To provide the necessary buoyancy for a 2,500-lb. machine, allowing a reasonable margin, bags of a total volume of at least 50 cubic feet were necessary. The standard steel compressed air bottles used for starting seaplane engines were about 2 ft. long by 6 in. dia., and contained the equivalent of 20 cubic feet of air at atmospheric pressure, compressed to about 1,200 lb. per sq. in. and weighed somewhere about 12 lb. each. Thus for direct inflation of the bags of even a small two-seater machine three bottles would be needed, and a large amount of space would be required.

To overcome this trouble experiments were made with air injectors, and a very simple and satisfactory type was devised, consisting of a jet of very fine bore directly connected to the high pressure bottle surmounted by three cones of increasing diameter pressed out of solid drawn steel tube. The small end of the last cone was coupled directly to the main cock in the bag supply pipes.

This type of injector would inflate a bag whose cubic capacity was three times the bottle air content to a pressure of 1 lb. per sq. in. in less than one minute.

The general scheme of the connection is shown in a sketch, and the *modus operandi* of inflation was as follows:—The main air cock B being open the valve on the air bottle A is opened and high pressure air allowed to flow till air

Skid and hydrovane chassis, as fitted to a Grain "Griffin."

could be felt blowing back through the injector. This occurred when the air bags were fully inflated and could be felt immediately by the hand. Cock B was then shut off.

This process took from 20 to 40 seconds, according to the size of air bag and the bore of the injector high pressure jet.

Further refinements were also fitted, as a valve which cut off communication between the two air bags, and a hand trimming pump with which it was possible to compensate for leakage in either or both bags when afloat.

Finally, a wholly automatic system was revised whereby a pilot, having decided to alight on the water, turned on the air cock, and the whole process of inflating, turning off the bag supply cock at the right moment, and releasing the wheels was performed for him without further action on his part.

A Voisin Biplane fitted with wing flotation bags.

Regarded as an emergency fitting for land machines which have to operate over sea, this flotation gear has many good points. It was simple to construct and in use, was not unduly heavy, could be adapted to almost any type of aeroplane, and it would keep a machine afloat right way up for many hours

Emergency Flotation Gear on a Curtiss J.N.4.

in quite a rough sea. Small single and two-seater machines so fitted would remain in one piece on the water under weather conditions which would break up most seaplanes of similar size, and the pilot of a machine so fitted could go out to sea with considerably greater confidence than in a land machine devoid of such apparatus.

On the other hand, there is some reason to suppose that the success of the P.V. emergency flotation gear was used in certain circles as an argument against continuing experimental work on the smaller classes of seaplane, and that it is thus indirectly responsible for some of the neglect into which this type of aircraft has fallen.

For commercial land machines which in the course of their route may have to cross stretches of sea, this gear has considerable value, and it is therefore noted here that the system is covered by patents in the name of Lt.-Col. H. R. Busteed, and that the rights for the manufacture thereof have been granted by him to Short Bros., of Rochester.

[THE END.]

NEW COMPANIES.

Aero and Motor Company, (Manchester), Limited.—Private company. Registered Nov. 29th. Capital, £2,000 in £1 shares. To take over the business of a motor car dealer carried on by A. D. Scarlett at 8, Peter Street, Manchester, as the "Aero and Motor Co.," etc. The first directors are:—A. D. Scarlett, 25, Plymouth Grove West, Manchester; B. M. Papelian, 46, Clarenden Road, Chorlton-on-Medlock, Manchester (of Persian nationality); A. Scarlett, 25, Plymouth Grove West, Manchester. Regd. Office:—8, Peter Street, Manchester.

First Atlantic Flight, Limited.—Registered Nov 29th. Cap. £100 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in aeroplanes and airships, and all parts, equipment or accessories therefor, etc. The subscribers (each with one share) are:—A. W. Claremont, Vernon House, Sicilian Avenue, Bloomsbury, W.C.1., solicitor; H. L. Stuart, Vernon House, Sicilian Avenue, Bloomsbury, W.C.1, solicitor; C. R. R. Tildesley, Vernon House, Sicilian Avenue, Bloomsbury, W.C.1, solicitor; and four clerks. No person had consented to act as directors to Nov. 18th. Solicitors:—Claremont, Haynes and Co., Vernon House, Sicilian Avenue, Bloomsbury, W.C.

Mails—Parcels—Passengers

DAILY TIME TABLE.

HOUNSLOW (depart)... 12.30 p.m.
LE BOURGET (arrive) 2.45 p.m.

LE BOURGET (depart) 12.30 p.m.
HOUNSLOW (arrive)... 2.45 p.m.

Mails

By arrangement with the British and French Post Offices an express air-mail is now carried daily on this route. The fee is 2s. 6d. an ounce, over and above the usual rates of postage, and letters which are handed in during the morning in London, up to the times indicated, and at the Post Offices specified below, will be delivered in Paris by about 4 p.m. the same afternoon.

G.P.O., King Edward's Buildings, 11 a.m.; Threadneedle Street, 10.45 a.m.; Lombard Street, 10.45 a.m.; Parliament Street, 10.45 a.m.; Charing Cross 10.50 a.m.; W.C. District Office, 11.10 a.m.; W. District, 11.15 a.m.; S.W. District Office, 10.40 a.m.

Passengers

The passenger fares are as follows:—Single, £21; return, £42. This fare includes free conveyance by motor-car to Hounslow Aerodrome from any point within a mile of Piccadilly Circus, and also conveyance by motor from Le Bourget into Paris. Similar arrangements exist as to the journey from Paris to London. A passenger, called for at an hotel in London at 11 a.m., arrives at the door of his hotel in Paris by 4 p.m. the same afternoon.

Parcels

The rate for parcels is 5s. 1b., but in the case of parcels weighing more than 2 lbs., or for regular consignments, much lower rates can be quoted If handed in up to 10 a.m. at the agents specified below, parcels will reach Paris the same afternoon; whereas by land and sea, even if a special "Grand Vitesse" fee is paid, a parcel is several days, and perhaps a week, in reaching its destination.

Full particulars regarding freights can be obtained from Aircraft Transport and Travel, Ltd., 25-27, Old Queen Street, S.W.1., or from the American Express Co., Queen Street and Haymarket; Thos. Cook & Son, Ludgate Circus, E.C., and 38-39, Piccadilly, W.; General Transport, Ltd., 52, Crutched Friars; J. Jackson & Sons, 7-8, Charing Cross, and King William Street, E.C.; Henry Johnson & Sons, 18, Byward Street, and Beak Street, W.; Carter Paterson & Co., 6, Maddox Street, W., and 3, Cannon Street, E.C.; Lep Aerial Travel, Piccadilly Circus (Criterion Corner); and Hernu, Peron & Co., 98-100, Queen Victoria Street, E.C.

NOTE.—Parcels are received up to 10.30 a.m. at the two depots mentioned above of the American Express Company; or up to as late as 11.30 a.m. at the Hounslow Aerodrome.

GREAT BRITAIN.

FROM THE "COURT CIRCULAR."

BUCKINGHAM PALACE, Dec. 10th.

The King held an Investiture in the Ball Room of the Palace at 11 o'clock this morning.

The following were severally introduced into the presence of the King, when His Majesty invested them with the Insignia of the respective Divisions of the Orders into which they have been admitted:—

THE MOST DISTINGUISHED ORDER OF SAINT MICHAEL AND SAINT GEORGE.—Companions.—Air-Commodore Edward Maitland, R.A.F. (also received the Air Force Cross); and Lieut.-Col. Philip Herbert, R.A.F. (also received the Insignia of a Commander of the Most Excellent Order of the British Empire (Military Division)).

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE (MILITARY DIVISION).—Commander.—Sqdn. Ldr. George Scott, R.A.F. (also received the Air Force Cross)

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE (MILITARY DIVISION).—Officer.—Sqdn. Ldr. Donald Rainsford-Hannay, R.A.F.

Member.—Capt. George Golding, R.A.F.

The King then conferred decorations as follows:—

THE DISTINGUISHED SERVICE CROSS.—Capt. Frederick Horstman, R.A.F.

THE MILITARY CROSS.—Capt. Charles Smart, R.A.F.; Flying Officer Robert Reid, R.A.F.; Lt. Henry Sparkes, K.R.R.C., attd. R.A.F.

THE DISTINGUISHED FLYING CROSS AND BAR.—Capt. William Hubbard, R.A.F.

THE DISTINGUISHED FLYING CROSS AND THE AIR FORCE CROSS.—Sqdn. Ldr. Reginald Leslie, R.A.F.

THE DISTINGUISHED FLYING CROSS.—Lieut.-Col. William Douglas, R.A.F.; Capt. William Reed, R.A.F.; Capt. James Robb, R.A.F.; Lt. William Ackery, R.A.F.; Flying Officer Robin Haworth-Booth, R.A.F.; Flying Officer Hedley Nicholls, R.A.F.; Lt. Cyril Rayment, R.A.F.; Flying Officer Adrian Reeves, R.A.F.; Lt. Francis Robinson, R.A.F.; Lt. Ian Ross, R.A.F.; Lt. Frederick Russell, R.A.F., Flying Officer Hugh Saunders, R.A.F.; Lt. Victor Siddons, R.A.F.; Flying Officer Charles Spackman, R.A.F.; Lt. Malcolm Stewart, R.A.F.; and Pilot Officer Francis Seed, R.A.F.

THE AIR FORCE CROSS.—Wing Comdr. Cuthbert Rabagliati, R.A.F.; Sqdn. Ldr. Douglas Harries, R.A.F.; and Flying Officer Guy Harris, R.A.F.

BUCKINGHAM PALACE, Dec. 11th.

The King held an Investiture in the Ball Room of the Palace at 11 o'clock this morning.

The following were severally introduced into the presence of the King, when His Majesty invested them with the Insignia of the respective Divisions of the Orders into which they have been admitted:—

THE DISTINGUISHED SERVICE ORDER.—Wing Comdr. Charles Stanford, R.A.F. (late Surgeon-Comdr., R.N.); Flight Lt. Alfred Whistler, Dorsetshire Regiment, attd. R.A.F. (also received the Distinguished Flying Cross and Bar)

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE.—Member.—Military Division.—Maj. Errol Knox, Aust.P.C.

The King then conferred decorations as follows:—

THE MILITARY CROSS AND THE DISTINGUISHED FLYING CROSS.—Flight Lt. Edmund Tempest, R.A.F

THE DISTINGUISHED FLYING CROSS.—Sqdn. Ldr. Andrew Walser, R.A.F.; Flight Lt. Douglas Lapraik, R.A.F.; Capt. William Scott, R.A.F.; Capt. Robert Sharp, R.A.F.; Flight Lt. John Yonge, R.A.F.; Lt. Sydney Bull, R.A.F.; Flying Officer Peter Haworth, R.A.F.; Flying Officer Norman Mawle, R.A.F.; Lt. Thomas Scott, R.A.F.; Flying Officer Reginald Skelton, R.A.F.; Lt. Robert Spence, R.A.F.; Lt. William Steele, R.A.F.; Lt. Eric Walker, R.A.F.; Flying Officer Edward Waring, R.A.F.; Lt. Ignatius Welby, R.A.F.; Lt. George Welsh, R.A.F.; Lt. Harold Wickett, R.A.F.; Lt. Paul Wilkins, R.A.F.; Lt. Norman Williams, R.A.F.; Lt. Roy Wilson, R.A.F.; Lt. Lawrence Wingfield, R.A.F.; Sec. Lt. Leslie Thres, R.A.F.; Sec. Lt. Ronald Turner, R.A.F.; and Sec. Lt. Alfred Watters, R.A.F.

NAVAL.

ADMIRALTY APPOINTMENTS.

The following appointments have been made:—

Dec. 10th.—Art. Engrs.—R. V. Nelson, to "Furious," addl., for "Alexander," on reducing to reserve complement, Dec. 5th.

R.A.F.—Flight Lt. (A.).—D. G. Donald, to "Vindictive," Aug. 1st.

Gunner.—E. W. Roberts, to "Furious," for "Alexander," Dec. 11th.

Dec. 11th.—Engr. Lieut.-Comdr.—J. D. Grieve, to "Vivid," addl., for "Eagle," Dec 10th.

Art. Engrs.—W. R Switzer, to "Vivid," addl., for "Eagle," Dec. 30th.

Wt. Mech.—A. M. Stuart, to "Vivid," addl., for "Eagle," Dec. 30th.

R.A.F.—Flying Officer (S.).—H. L. Macro, to "Pegasus," Dec. 2nd.

Flying Officers (A. and S.).—S. C. Strafford and W. R. Curtis, to "Pegasus," Dec. 2nd.

O. Officers (O.).—E. B. C. Betts, L. Ritson, E. J. Garner, and D. R. W. Thompson, to "Pegasus," Dec. 2nd

Lord Jellicoe's Report.

In the course of Lord Jellicoe's report to the Commonwealth Cabinet upon the sea defence of Australia, it is recommended that the Naval requirements of Australia shall be divided into three classes and that the first of these, "the striking force," shall contain one aircraft-carrier to every two units.

Lord Jellicoe also recommends the formation of a Far Eastern Fleet which shall contain four aircraft-carriers.

No. 6 Wing R.N.A.S. Dinner.

On Saturday, Dec. 13th, at the Trocadero Restaurant, members of No. 6 Wing, R.N.A.S., Otranto, Italy, held their first re-union dinner. Col. G. H. K. Edmonds, D.S.O., the first C.O. of the wing, presided, and among those present were Comdr. Murray Sueter, R.N., Col. A. Longmore, D.S.O., Comdr. Beuttler, R.N.R. Maj. Pulford, Maj. Mackenzie, and Maj. Leslie. In all some forty members attended.

Such was the success of the dinner that it was unanimously determined to make it an annual affair, and it is hoped to hold the next dinner on the second Saturday in December of next year.

MILITARY.

The Afghan War.

The following is taken from some telegrams, received on Dec. 8th from India, which contained information regarding the state of affairs on the North-West Frontier:—

"Minor raiding by Mahsuds continues, and a party of 100 strong are reported out to attack the aerodrome at Bannu. The houses of several of the chief Mahsud Maliks are reported to have been destroyed by recent air operations.

The Piti Madda Khel and Hassan Khel sections of the Tochi Waziris, inhabiting the Upper Kaitu valley, refused to comply with our terms, and were effectively bombed on the morning of Dec. 6th, when 2¼ tons of bombs were dropped and 2,100 rounds of small-arm ammunition fired. These were the only sub-sections of Tochi Waziris who had remained recalcitrant.

Air operations against the Mahsuds continue with good effect."

There is no indication that this news is official.

Owing to the Mahsuds' decision, at a Jirgah held more recently than the one of Dec. 8th, to accept the British terms, aerial operations have been provisionally suspended.

According to Reuter it appears probable that the aerial bombardment of Afghan towns and villages is not alone sufficient to bring about the surrender of the tribes, and it is now likely that troops will be taken into the Mahsud country.

AIR FORCE.

Summary of the Results of the R.A.F. Mail Services.

The following communiqué was issued by the Air Ministry on Dec. 12th. THE AEROPLANE takes no responsibility for the official phrasing:—

Some interesting detailed statistics are now available regarding the six months running of the Folkestone-Cologne mail service which was terminated towards the end of October.

The actual cross-Channel service was inaugurated on March 1st, and was the development of various mail delivery services which had for some time previously been in operation in France and Belgium. Prior to March 1st the mails were shipped to France and taken by ground transport to the aerial distributing centres. These, services, however, were not carried out regularly for any lengthy period over particular routes, but were constantly being changed as the movement of troops and progress of demobilisation rendered necessary. It is, therefore, not possible to give any detailed and useful statistics for the period, before March 1st but it is of interest to note that out of 1,023 trips commenced only 45 were uncompleted from any cause. This represents an average percentage of successful flights of not less than 96. If the fact be borne in mind that all these flights took place over difficult country, and in the bad weather of the winter months December to March, this result is particularly good.

Three squadrons were at first employed on the cross-Channel service—Nos. 18, 110, and 120, equipped with D.H.9a, D.H.9, and D.H.4 machines.

From March until July the mails were not usually carried direct from Hawkinge to Cologne, but were flown from Hawkinge to Maisconcelle (later on Marquise) and there transferred to other machines for Cologne.

Neither Maisconcelle nor Marquise, however, were half-way stages, both being considerably nearer Hawkinge, so that the longer and more arduous portion of the journey, including that over the range of high hills between Lille and the German frontier, had to be negotiated by the pilots of Nos. 110 and 18 Squadrons at Maisconcelle and Cologne respectively.

The distance from Hawkinge to Maisconcelle was roughly 67 miles and from Maisconcelle to Cologne 229 miles—a total distance of 296 miles against 250 miles over the non-stop route

adopted later. The average time for the first stage was one hour, and for the second two hours and a quarter.

From July 22nd the squadron at Marquise ceased to operate and the through service between Folkestone and Cologne was thenceforward regularly flown until the termination of the aerial mail. Even before that date many individual through flights had been successfully made.

During the six months' flying subsequent to March 1st, 1,842 trips were made, comprising rather over 3,000 hours in the air. Up to 460 lb. weight of mails were carried per machine trip.

Of the 1,842 flights begun, 96 per cent. were successfully completed. Of the 4½ the percentage of flights which failed slightly over 2 per cent. were due to engine trouble, or mechanical defect and under 2 per cent. to bad weather.

Of the through flights from Folkestone to Cologne of 270 begun 267 were completed, or only 1 per cent. of failures.

The regularity of service was also good. Mails were carried from Folkestone on 146 out of the 182 days under review and from Cologne on 139 days. The percentage works out at 80.2 per cent. and 76.4 per cent. respectively. The times of departure of the aerial service were fixed so that in the event of the weather being impossible for flying the mails could be sent by rail or boat without delay.

A striking feature of this service was its immunity from casualties. During the six months covered, only one pilot and one passenger were injured, both in the same accident.

Although this service has provided valuable data on many of the points which arise in the working of a commercial service, it has been found impossible for various reasons to deduce actual running costs per lb. of mail carried. For instance, the total possible load of the machines in use was 600 lb., but not more than 460 lb. were ever carried in one machine and very often considerably less; and again, of each machine available was not employed as regularly or as frequently as it would have been on a commercial service.

The figures would not therefore have represented true values for the cost per ton carried.

The London-Paris Service.

Details have also been prepared of the London-Paris service for the same period.

This service was carried on by two composite squadrons one at Hendon—afterwards moved to Kenley—and the other at Buc, near Paris. The machines used on this service were chiefly D.H.4s, but Handley Page, Martinsyde, and Bristol "Fighter" types were also employed—all the machines being fitted with Rolls-Royce engines. This service differed from the Cologne service as being primarily for passenger work though official mails and dispatches were also frequently carried.

The total number of trips made from the commencement of this service to the end of August amounted to 744, while 934 passengers and 1,028 mail bags were carried. A certain number of these flights were to various other French or Belgian towns; 90 per cent., however, were to Paris.

Of the flights made between March 16th and the end of August—556 were completed and 52 failed; 13 on account of weather conditions and the remainder owing to mechanical defect or engine trouble. The percentage of successful trips therefore amounted to 91.

In this service machines were not working to their full capacity. Naturally, owing to this fact, the resulting cost (which was obtained for another purpose) is higher than would otherwise have been the case, but the data so obtained are interesting and valuable as roughly indicating the possibility of commercial aviation as a paying proposition, though it has not been possible to work out the costing in great detail.

In arriving at these figures allowance has been made for depreciation on buildings and plant of 5 per cent. per annum on original cost, as well as rates and upkeep. Depreciation on the machines employed has been charged for the one month's running under review at 1/12th of their initial cost, thus allowing a complete write off of each machine in one year, while that on engines has been taken at 1/36th of initial cost, allowing lifetime as three years. This, of course, is in addition to the full charges for all personnel employed and all stores consumed.

Taking the average weight of a mail-bag as 25 lb. and of a passenger as 130 lb. and working on the figures of May as being a representative month on this service, the actual cost worked out to one shilling and a halfpenny per ounce per 205 miles—the actual distance between Kenley and Paris.

During the six months there were five accidents on the service in which three pilots and one passenger were killed and two pilots and one passenger were injured.

Taking the combined results of the two services it appears that of 2,450 trips begun since March 1st no less than 2,331 were successfully completed, the proportion of failures amounting only to 5 per cent., the percentages due to weather and mechanical defect being 2.8 per cent. and 2.2 per cent. respectively.

As the early months of this period provided particularly bad weather this result is satisfactory.

100 Squadron R.A.F.

The first annual dinner for the officers of 100 Squadron will be held at the Holborn Restaurant, London, on Jan. 3rd, 1920, at 7 p.m., the dinner for W.O.'s, N.C.O.'s and men on Dec. 31st, 1919, at 6.30. Will all members who can attend please write at once to Captain C. Gordon-Burge, Dent-de-Lion, Westgate-on-Sea, Kent?

A Presentation.

Sir Chas. Wakefield, Bart., has presented set of trophies, cups and medals to the Royal Air Force for a series of boxing

AN AERIAL REVIEW.—Three Squadrons of Bristol "Fighters" at Spiel, Cologne, awaiting inspection by General Sir William Robertson, G.C.B., G.O.C. the Army of the Rhine.

competitions amongst the officers and men. The trophies, cups, and medals have all been specially designed and the gifts have been accepted by the Air Council, and the trials will begin shortly. The trophies are on view at the premises of Skinner and Co., Ltd., 34, Bond Street, W.1.

A Walking Championship.

Mr. W. Hehir, R.A.F., of the Surrey A.C., won the Southend Harriers' open handicap on Dec. 13th. The handicap was held over the roads in the Chelmsford district, and from scratch Mr. Hehir covered 7 miles 1,000 yards in 58 min. 19 sec.

AUSTRALIA.

The Air Ministry announced on Dec. 13th that Capt. Wrigley, Australian Flying Corps, with Serjeant Murphy as observer, had just completed a flight from Melbourne to Port Darwin. The flight was made on a B.E. 2E machine, with a 90 h.p. R.A.F. engine. This machine was four years old. This is the first time that Australia has been traversed by air.

FRANCE.

The New Organisation of the Aerial Arm.

The aerial arm will consist in future of 11 regiments. Five of these are allocated for observation duties and will be under the orders of the corps commanders in whose areas they are stationed. Each regiment will be commanded by a colonel (in principle), and each will consist of four groups divided into two or three escadrilles. Each group will be under a lieutenant-colonel and captains will command the escadrilles.

The five regiments described above will be stationed as follows :—

1 Regiment : Tours (Commandant Muiron).
2 ,, Le Bourget (Commandant Delafond)
3 ,, Lyon (Commandant Benoit).
4 ,, Dijon (Commandant Maginel).
5 ,, North Africa (Commandant Rolland).

Two further regiments will be formed at a later date.

In addition there is an independent Force (presumably directly under the orders of G.H.Q.), consisting of three regiments for aerial fighting and three bombing squadrons, all under the command of Colonel de Vaulgremand. The regiments will be commanded as follows :—1st Fighting, Commandant Brocard; 2nd Fighting, Commandant de Marancourt; 3rd Fighting, Captain Bladigniere; 1st Bombing, Commandant Vuillemin; 2nd Bombing, Commandant Galet; 3rd Bombing, Commandant Laurence.

Aerial Surveying.

Commandant Vuillemin and Lieut. Dagneau, whose arrival at Algiers was reported last week, left that place for Constantine, Biskra and Lake Chad on Dec. 14th. They took with them mechanics and an observer. Landing places have been arranged. The distance to Lake Chad is roughly 950 miles.

ITALY.

The Italian correspondent of THE AEROPLANE writes :—

War Losses of Italian Airships.

The following referring to the end of 12 of the 25 Italian airships mobilised has appeared since the censorship was revived here.

V.1 (Royal Italian Navy).—Brought down by artillery fire at Pola on Aug. 5th, 1915, and fell into the sea. Her crew of five were made prisoners.

P.6.—Burnt in her shed at Campalto by Austrian aircraft, Aug., 1915.

M.2 (Royal Italian Navy).—Brought down by the combined efforts of aeroplane and artillery fire on the return from a trip to Fiume at Lussin on June 8th, 1915. Lost two dead, one wounded, and four prisoners.

M.3 ("City of Ferrara").—Hit by artillery fire in the Vippacco Valley on May 23rd, 1915. Fell to the earth at Codroipo.

M.4.—When returning from a bombing raid at dawn on May 4th, 1916, was hit by artillery fire near Gorizia. The heroic end of Capts. Pastine Casella and Coturri with pupil Pilot Pasquali and Serjt. Maj. Motorist Berardis is an Italian war epic.

M.5.—Burnt at Turin on June 3rd, 1916, owing to collision in the air with an aeroplane. The C.O. perished with five others, and five men were wounded.

M.7.—Was torn away from her anchorage by a hurricane and lost at sea, Aug. 16th.

M.8 (Royal Italian Navy).—Was set on fire in her shed and burnt in Sept., 1917, by Austrian aeroplanes.

M.10.—Hit by artillery fire at Prosecco and fell at Latisana, Sept. 22nd, 1917.

M.12.—Was hit by artillery fire from the Hermada district and was wrecked in the sea at Grado on the morning of May 22nd, 1917. Commander Valle perished with her, as also navigating officer Soli.

M.13 (Royal Italian Navy).—This vessel, too, was set on fire and burnt in her shed by enemy aeroplanes, Sept., 1917.

M.17 (Royal Italian Navy).—Fell into the Venetian lagoons on the night Feb. 3-4th, 1918. Thought to be a victim to a shell from Motta di Livenza.

The comparatively small total of 13 deaths and 10 prisoners divided among 12 biggish airships shows the comparative safety of the lighter-than-air vessel even in warfare. It is noteworthy, too, that M.1 and M.6 are still in commission and going in for educational work—T. S. H.

POLAND.

Lieut. Edwin Pike Graves, late R.A.F. pilot, was killed at Lemberg while taking part in an exhibition flight given by the Kosciuszko squadron, the squadron of American fliers serving with the Polish army against the Bolsheviks. Mr. Graves, who is an American, joined the Koscinszko squadron shortly after he was demobilised from the British Royal Air Force.

The right wing of an Austrian-made Albatros D.III which he was flying came off while doing a roll. He retained his presence of mind, loosened his safety belt and jumped with a parachute. Unfortunately the machine was only 150 feet from the ground by this time and he struck the ground just as the parachute was opening. He was instantly killed. He was engaged to Miss Dulcie Huntington, of West Kensington, London.—P. B.

U.S.A.

An Echo of Recent Hostilities.

Mr. Daniels, Secretary for the Navy, has approved the sentence of dismissal passed by the Naval Court-martial upon Capt. Edmund George Chamberlain, U.S.N.A.S. The court-martial was held, partly in Paris, early this year, and Capt. Chamberlain was tried for certain statements made with regard to a somewhat extraordinary exploit in aerial warfare in which he claimed to have taken a principal part.

A Service Sale.

The Navy Department are to sell some two hundred seaplanes and flying boats, and a number of engines and accessories. At a sale held on Sept. 22nd twenty-seven seaplanes and a considerable quantity of equipment were sold, out of a total of two hundred and nineteen seaplanes and flying boats and four hundred and forty-one engines that were offered, the remainder being unsold as the bidding did not come up to the appraised value.

AIRCRAFT IN PARLIAMENT

Dec. 8th.—The following written answer was given :—

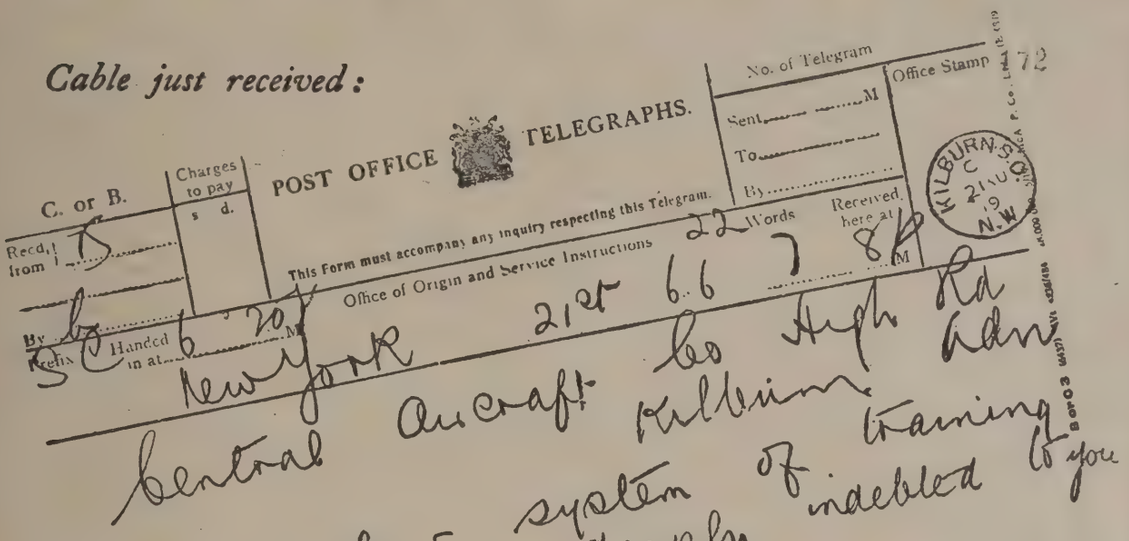
AIR MAIL SERVICE (FEE).

Lieut.-Comdr. KENWORTHY asked the Postmaster-General whether he is aware that the Assistant Postmaster-General in the Government of the United States of North America has stated that by use of aeroplanes to carry mails between New York, Chicago, and Washington at two cents a letter a saving will be effected of over 1,500,000 dol. in 1920 over all other methods of transit; and, in view of this statement, will he reconsider the air-mail fee of 2s. 8½d. between England and France with a view to popularising this service and placing it on a commercial footing.

Mr. PEASE : The sum of 1,500,000 dol. referred to by the hon. Member is the estimated value of the travelling post offices and other railway rolling-stock and the time of post office sorters which will be rendered unnecessary by the provision of the additional aeroplanes recently ordered by the United States Post Office for its air mail services. Payment for the conveyance of mails by rail in the United States is made on a basis different from that in force in this country, but I do not gather that the sum indicated is a net saving consequent on the use of aeroplanes for the conveyance of mails. The air mail service between London and Paris is experimental, and the arrangements are of a temporary character and will be reviewed after six months' working. I hope that when permanent arrangements for the service are made it will be possible to reduce the amount of the special fee.

* * *

Dec. 9th.—The following oral answer was given :—



HELICOPTER FLYING-MACHINES.

Lieut.-Comdr. KENWORTHY asked the Secretary of State for War whether he is aware that the French Government have recently granted a sum of about £4,000 to aid inventors in carrying out experiments with the helicopter type of flying-machine; whether the Air Ministry are alive to the very great importance of such experiments; whether all encouragement is being given to British inventors who may wish to experiment with this system; and whether any sums of money have been granted for such experiments.

Mr. CHURCHILL : the answer to the first and second parts of this question is in the affirmative. The answer to the third and fourth parts is that any proposals for a helicopter type flying-machine brought to the notice of the Air Ministry are sympathetically considered and such financial assistance as appears proper is given. Adequate financial provision has already been made for the purpose. Since June, 1916, this line of research has been continually explored, and I am personally familiar with the details of the progress made with these experiments, in which, while Minister of Munitions, I took a great interest.

Dec. 10th.—The following oral answers were given:—

PARIS EXHIBITION (BRITISH AEROPLANES).

Lieut.-Comdr. KENWORTHY asked how many British aeroplane firms are showing at the Paris Exhibition; whether the number is satisfactory; and what steps are being taken to encourage and assist British firms to attend foreign exhibitions of aircraft.

Capt. GUEST (Joint Parliamentary Secretary to the Treasury): I have been asked to reply to this question. The answer to the first and second parts is that six British aeroplane firms are showing at the Paris Exhibition, and that on the whole this number of exhibitors may be taken to be satisfactory. The Society of British Aircraft Constructors was unable to obtain sufficient space on the ground floor for a corporate exhibit, and, therefore, are not exhibiting. In regard to the last part of the question, offers of assistance were made to the Society of British Aircraft Constructors at a meeting held early in October.

AIR MINISTRY—STORES DEFICIENCIES.

Mr. RAPER asked the Secretary of State for War how much has been written off since the Armistice as a charge against the public for stores deficiencies of air squadrons stationed in Great Britain and of the various air store depots and parks which were at that time in existence.

Capt. GUEST: This information would take some time to collect, and I am unwilling at present to throw additional work on the Air Ministry and local Air Force staffs; but if my hon. friend presses for it I will obtain the information and send it to him

Mr. RAPER: Can the hon. and gallant gentleman give us some rough idea of the amount?

Capt. GUEST: No, I cannot, and I do not think a rough idea is what the hon. Member requires.

Mr. RAPER: When can we have these particulars?

Capt. GUEST: When the pressure on the Ministry is a little less than it is now.

COMMERCIAL ORGANISATION.

Mr. RAPER asked the Secretary of State for War if he will now appoint a small but permanent committee, composed of two or three hon. Members of this House and two or three gentlemen outside the House who have a knowledge of commercial organisation, to assist the Air Ministry authorities in finance and business matters generally.

Capt. GUEST: I have nothing to add to the answers which I have already given to my hon. friend in reply to similar questions on March 31st and April 3rd last.

Mr. RAPER: Is it not a fact that the last answer given was that this question was under discussion?

Capt. GUEST: Yes, sir; and it is still under consideration.

THE DOUGLAS-PENNANT CASE.

In view of the irrelevance of the majority of the evidence given it has not been considered desirable to publish periodical accounts of the progress of this case. Much paper would have been covered by material of little relative importance in the progress of the world, and it would, in consequence, have been necessary to exclude from the paper news of greater value.

Miss Douglas-Pennant was appointed Commandant of the Women's Royal Air Force on May 4th, according to an Air Ministry's circular issued through the Press Bureau. This announcement was, in the view of the Committee, "an instance of the want of accuracy on the part of the Air Ministry, of which we have had more than one illustration in the present case." She had not made up her mind to accept any such post nor did the office exist in fact. The rank then in existence was "Chief Superintendent." She was never given a formal appointment, and her office was therefore not governed by King's Regulations in the paragraphs dealing with removal for misconduct. "She never signed the form of enrolment App. A, pp. 41 to 43 of F.S. Pub. No. 14; she was never enrolled; and if she wore without objection, as we believe she did, the uniform of the Women's Royal Air Force, that is but another illustration of the want of system in the proceedings of the Air Ministry. . . . Her employment was only a temporary employment by way of loan." (From the National Health Insurance Commission). . . . "The Minister could dispense with her services at any time if, in the honest exercise of his discretion and in the interest of the public service, he thought it right to do so."

Omitting the intervening history, it is sufficient to say that Lord Weir dispensed with her services on Aug. 28th. After consideration she felt that she had been unfairly treated, and in person and through friends and supporters she successfully agitated for the formation of a Select Committee of both Houses to inquire into her grievances. Before this Committee she laid a mass of charges and complaints, accusing officers of all ranks with, in some cases, intrigue, in others incivility, and in a few instances immorality.

The Committee went into the specific charges of obstruction in detail, and it was shown by means of minutes in the files that these charges were unfounded.

They then examined the charges as to immorality in the W.R.A.F. and the support said to be given thereto by certain general officers. Para. 57 of the Report describes Miss Douglas-Pennant's action in this matter:—

"Miss Douglas-Pennant could not produce a single minute to M.G.P. or any superior officer calling his attention to the existence of immorality and to her being powerless to prevent it. Sir Godfrey Paine (her witness) says that she never mentioned immorality to him, that he 'had a suspicion, but she certainly did not accuse any individual or any particular hostel, or anything like that. It was general.' She was asked to name any witness who could give evidence upon the subject. She named Mrs. Beckett. She did not call Mrs. Beckett. She named Mrs. Digby Read. She did not call Mrs. Digby Read."

The following paragraph from the Report (para. 121) summarises the service character of Miss Douglas-Pennant and may well end this piece:—

"Miss Douglas-Pennant is, upon the materials before us, shown, we think, to be a woman full of zeal and activity, much impressed with her own importance, very reckless in her imputations upon others (of which we have had grievous examples in this case), and one not at all likely to get the best out of those with whom she had to work or over whom she had authority. The story of the intrigue against her has originated, in our opinion, in her distortion of events and from her incapacity to see things in their true perspective. This distortion reaches its climax when she accuses Sir Auckland Geddes of being a party to the intrigues. There is no doubt about it. She says so (Q. 1364, p. 74), and the same with Lady Rhondda (Q. 1365, p. 74)."

ARMS AND THE MAN.

Mr. Robert Loraine, actor-manager (better known, perhaps, to readers of this paper as Lieut.-Col. Robert Loraine, D.S.O., M.C., late R.F.C.), has achieved, at the Duke of York's Theatre, another success in "Arms and the Man," which, if not perhaps equal as a *tour de force* to "Cyrano," is, in one's personal opinion, an even better piece of acting. Mr. Loraine shows his ability as a manager no less than as an actor in selecting this particular play for production at this particular moment when a little of the glamour of soldiering has passed and when people are more inclined to regard the soldier as an integral part of the composition of the nation and as a man who follows a profession as a profession, free from high falutin' ideas. Both the play and the acting will do good.

The story of "Arms and the Man" is probably best known to the majority of Londoners by way of "The Chocolate Soldier," and there will doubtless be those who will regret that Mr. Loraine has omitted to interpolate into Mr. Bernard Shaw's text the one tune which made that saccharinated opera the craze of the crazy, but that is merely by the way.

Mr. Loraine is to be particularly congratulated on having chosen his companions in the cast. Miss Campbell is adequately "stagey" as Raina, but she might perhaps make a greater effort to drop her staginess when she is "discovered" in the last act by the Swiss captain.

Mr. Gerald Lawrence is, one thinks, inclined to over-do the staginess of his part. His method of playing reminds one somehow of the famous American critique of a production of "Romeo and Juliet" in which the critic remarked that "with a little assistance from the stage carpenter the Romeo could adequately have played the balcony." The untutored Bulgar may be grandiloquent, but one doubts whether he is ever deliberately "stagey."

Miss Holmes-Gore, as Louka, gives one of the best performances that has been seen for many years. She manages to combine skilfully the aspect (albeit very charming) of the semi-savage Bulgar with the manners of a tea-shop waitress. When so many important parts are wasted on incompetent actresses it is a pity that so little has been seen of Miss Holmes-Gore, who could play so many parts so much better.

Miss Beverley Sitgreaves as Raina's mother was as near the perfect person for the part as one could imagine, and Mr. Arthur Whitby as the servant, Nicola, is wholly excellent. The performance of Mr. M. R. Morand as Major Petkoff, the Bulgarian heavy father, was a perfect gem as a character study. One remembers Mr. Morand giving equally fascinating character studies in the Grossmith parts of Gilbert and Sullivan operas, and in "The Rose of Persia." It is a treat to see such acting as his.

One is a trifle doubtful as to whether the fashions of the Servo-Bulgarian war period were precisely those worn by the ladies of the cast. They struck one as belonging to an earlier date, but perhaps the Paris fashions took a year or two to reach Sofia. Also one has doubts as to whether the Servian officers were French képis. One's personal recollection of the pictures of the period is that the Servians wore a head-dress resembling the Austrian shako, but one assumes that Mr. Loraine made the necessary research into the costumes of the period before dressing the parts.

Be that as it may, the performance is wholly excellent, and Mr. Bernard Shaw's pitiless logic and biting humour will probably be better appreciated to-day, now that everybody has been closely in touch with militarisin in one form or another, than it was when the play was last staged in London.—

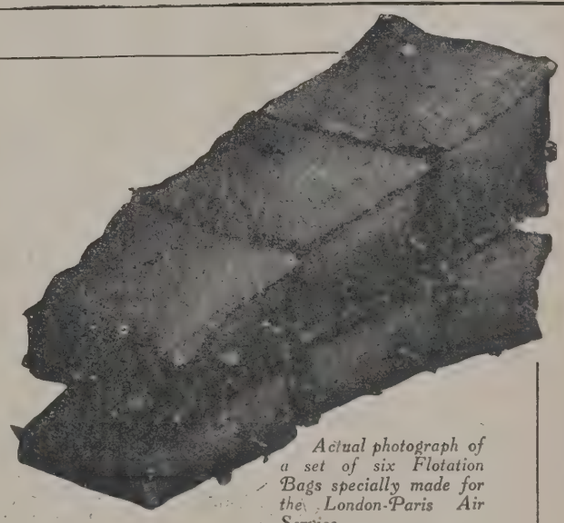
C. G. G.

The

Eastbourne Aviation Co., Ltd.,

Beg to Announce that, their Aerodrome having been relinquished by the Air Ministry, they intend opening a—

SPECIAL SCHOOL of FLYING for LADIES



on January 12th, 1920. Ex-R.A.F. Officers with special service training experience will be employed as Instructors.

Aeroplane Flotation Bags

The latest and most successful device for sustaining an Aeroplane when a forced descent has to be made upon the water. These bags, which are guaranteed absolutely air and water tight, are specially shaped to fit compactly into the framework of the fusilage. They are indispensable where flying is undertaken continuously over the sea, or other large stretches of water.

Actual photograph of a set of six Flotation Bags specially made for the London-Paris Air Service.

Dec. 11th	DH9.	Lt. Robins	12.40 p.m.	3 20 p. m			1 and Mail
	DH4a.	Lt. Bradley	Bad visi	bility	12.15 p.m.	crashed Caterham	1 and Mail
Dec. 12th	Thick fog in Channel and N.E. France. No flying possible.						
Dec. 13th	Weather totally unfit for flying.						

DEC. 10th.—The mails and parcels, which were in the D.H.16 piloted by Capt. Baylis, who landed at Lympne on account of the weather, completed the journey by air on the next morning.

DEC. 11th.—Lieut. S. B. Bradley left Le Bourget with one passenger, mails, and parcels. The pilot encountered very bad visibility of the Surrey Hills and unfortunately crashed at Caterham. The passenger, who was killed instantly, was Mr. George F. Rand, a Buffalo banker. Lieut. Bradley was seriously injured and died in Croydon Hospital on the morning of the 12th inst.

The mails and parcels from the crashed machine were duly delivered the following morning.

The First Inquest.

During the inquest held by the East Surrey Coroner at Caterham on Dec. 15th on the body of Mr. George S. Rand, a banker of Buffalo, New York, who was killed in the aeroplane accident while flying from Paris to London on Dec. 11th, Mr. Theophilus, solicitor, who appeared for Aircraft Transport and Travel, Ltd., said that the aerodrome at Kenley was most unfortunately situated, owing to local conditions with regard to the hills and the frequent mists.

Major Cyril Patteson, of the Aircraft Co., stated that the Surrey hills there were 800 ft. high, and, therefore, liable to the gathering of a lot of clouds. It might be perfectly fine and suitable for flying at Croydon on that afternoon, while at Kenley it was very cloudy and dangerous for flying.

The Coroner returned a verdict of "Accidental death."

The inquest on Mr. S. B. Bradley, the pilot of the machine, was to be held on the afternoon of Dec. 17th.

The Handley Page Services.

The regular service to Paris and Brussels will be available up to the day before Christmas for anyone who wishes to make the journey. In order to afford the pilots protection against the bad weather constantly encountered during the winter months, cowlings fitted with Triplex Safety Glass windows are being built over the cockpits of the machines on the services.

LONDON-PARIS.—Dec. 9th.—Capt. Jones piloted nine passengers and 124 lb. of freight from London to Paris. Sir George Noble was one of the passengers and experienced his third flight to Paris in a Handley Page machine.

During the week ended Dec. 10th 34 passengers and 1,245 lb. of freight were carried.

LONDON-BRUSSELS.—During the week ended Dec. 10th nine passengers and 434 lb. of freight were carried.

BROOKLANDS.

Everything in the garden was lovely at Brooklands on Dec. 10th. The sun shone brightly, but with seasonable heat. The wind was fresh; and the smell and sight of the pines exhilarating. The sentry at the gate did not die of exhaustion through shouting down the telephone to the R.A.F. Adjutant, asking permission for two on a "stink-wheel" to enter. And so two entered.

Just inside the entrance were found several beautifully camouflaged fuselages of Sopwith "Salamanders," which were being assisted onto R.A.F. lorries for a little country drive. Nothing of interest, except in the way of scenery, was then seen, until the first sheds were reached.

The Sopwith sheds contain many and interesting machines. The most excellent lines of the "Pup" are seen in the "Snapper" and the "Dove." There were several training machines there, a useful-looking monoplane, and the somewhat dismantled Schneider Cup machine.

Martinsydes, Ltd., engaged attention first, for out somewhere near the centre of the aerodrome was the first and only F.6. The machine had been hastily rigged for photographing purposes, and had a bucket containing sand hooked to its tail to prevent it from flying away. It is a sporting two-seater biplane of very pleasing appearance, somewhat like the F.4 fighter, and fitted with a 300-h.p. Hispano-Suiza engine.

In the interior of the Martinsyde shed is quite a museum. Besides an F.5 and another machine there are quite a number of fuselages of former machines, including the last of the "Tinsides." On the rear wall there are numbers of airscrews, some of great antiquity. At the works a new sporting type is being built, which is to have an engine of considerable horse-power.

In the early afternoon four Vickers "Vimy" machines, the first piloted by Sir John Alcock, K.B.E., D.S.C., set off for an aerodrome in Norfolk.

EASTBOURNE.

It is announced that the Eastbourne Aviation Co.'s flying school will be re-opened on Jan. 1st, 1920. It is proposed to include a course of tuition for aviatresses.

LONDON.

HOUNSLOW.—The War Office require the aerodrome at Hounslow for cavalry training purposes, and so the civil station will have to be moved. Although the inhabitants of Kenley are so adverse to aircraft, it is very probable that the new terminus will be on their Common. The site is said to be 300 ft. higher and less liable to become fog-bound than Hounslow. On the other hand it is in most dangerous country and is frequently hidden by low clouds.

It has been decided by the Directors of A. V. Roe and Co., Limited, that ordinary pleasure flying is to cease for the winter months.

Though there are many days during the winter on which flying is very enjoyable, such days are a minority in a British winter; and it is very doubtful whether the public is yet sufficiently educated in air matters to grasp the fact that a flight on a clear, frosty day, especially if a light fall of snow has taken place, is one of the most exhilarating of winter sports. It would certainly not be worth while to keep aerodromes open on the chance of a few passengers desiring winter flights.

This decision, however, does not mean that all the Avro machines will be sent away from Hounslow. Arrangements will be made for flying pupils to continue their courses of instruction, and demands for special flights can be met.

AUSTRALIA.

The Progress of the Vickers Vimy.

A Reuter message states that Captain Ross Smith was seen at Maronboy, to the north of Daly Waters, on the afternoon of Dec. 13th, proceeding in the direction of Port Darwin. It is therefore believed that engine trouble developed and that Captain Ross Smith decided to return to Port Darwin,

but instead successfully landed in the bush. He evidently resumed his voyage on the next morning, as he was subsequently seen passing over Daly Waters going southwards.

Government Assistance.

The Australian Government are encouraging civil flying by giving free instruction to returned soldiers taking up commercial flying. Many aeroplanes have arrived in the country, mostly Sopwiths.

INDIA.

The following "unofficial communiqué" was issued by the Air Ministry on Dec. 12th :—

Civil Aviation.

It is understood that the Government of India have decided that the development of civil aviation in India will in so far as mails are concerned best be attained by granting a monopoly for the carriage of mails throughout India to a single air transport company, which will not be linked with any aircraft manufacturing company. The monopoly will be limited to the carriage of mails, the postal rates for which will be fixed by the Government of India.

In fixing rates for the carriage of goods other than mails and for the carriage of passengers, the company operating the mail monopoly will have a free hand in open competition with any other companies which may be established for such traffic.

The Air Board.

An Air Board in India has been constituted as a purely advisory body to advise the Commerce and Industry Department. This Department now deals with all questions concerning civil aviation. The members of the Board consist of the Secretary to the Government of India (Commerce and Industry Department), the Director-General of Posts and Telegraphs, India, the Officer Commanding the Royal Air Force, a representative of the General Staff, and the Financial Advisor, Military Finance Department. There is also a Secretary of the Board.

THE ARGENTINE.

A Franco-Argentine Company.

An Argentine officer, Lieut. Houtsch, and a Frenchman, M. Jean Guichard, have formed a company in Buenos Ayres to instal a series of aerial transport services. The capital of the company is 1,000,000 piastres, of which three-quarters have been subscribed.

The Buenos Ayres-Montevideo Service.

An aerial service between Buenos Ayres and Montevideo has just been started. M. Jansen, the French Minister Plenipotentiary, M. Holf, the French Consul at Buenos Ayres, and Colonel Precardier, Chief of the French Mission, were present at the inauguration ceremony.

BELGIUM.

The Congo Air Service.

A Reuter message from Brussels dated Dec. 15th stated that the balance of the staff to inaugurate the air postal service between Leopoldville and Stanleyville in Belgian Congo would embark at Antwerp on Dec. 16th in the steamer "Albertville." The party included the two aviators MM. Franz Orta and Bastin, two mechanics and two joiners.

It is hoped that the air mail service will be in operation before the end of January.

CHINA.

The first Handley Page aeroplane was completely assembled and flown on Dec. 6th in Peking. One of the passengers was Mr. T. A. Barson, the chairman of the Peking firm whose enterprise was responsible for the first important aviation deal with China.

The machine was put together by Chinese workmen unable to converse with the foreign mechanics in charge, and there was some anxiety about the trial flight, which, however, was a perfect success.

On the same afternoon several pre-war military aeroplanes were flying, one built by Chinese. They were very much dwarfed by the Handley Page.

FRANCE.

The American Aero Club.

Mr. Augustus Post, Secretary of the American Aero Club, and delegate to the recent Aeronautical Congress of Belgium, has arrived in Paris recently from Italy. He stated that his club, besides offering large prizes for cross-Atlantic and Pacific flights, amounting in all to over £15,000, is trying to arrange a flight round the World

The Paris-Melbourne Flight.

M. Poulet left Bangkok on Dec. 2nd, two hours after the departure of Capt. Ross Smith, and was caught in an equatorial storm. Steering by his compass he managed to reach Rangoon, 350 miles behind his starting point, after a flight of eight hours.

PROXIME ACCESSIT. M. Etienne Poulet, who is the runner-up in the flight from Europe to Australia.

The "Auto" of Dec. 11th stated that he would return to Paris by air, and receive the Medaille Militaire for his exploits during the war and for his present flight. M. Poulet will then begin preparations for a round-the-world flight in the competition organised by the American Aero Club.

A message from Sydney dated Dec. 13th stated that strong representations were being made to the Federal Government to cable £1,000 to him and invite him to visit Australia before returning to France.

Capt. Marchal and America.

Capt. Marchal is about to embark for the United States, where he intends to make arrangements for a cross-Atlantic flight. He has already submitted his scheme to the Under Secretariat of Aviation in the French Government.

GERMANY.

A Flight to Warsaw.

A "Times" correspondent cabled from Berlin on Dec. 10th that a commercial Handley Page aeroplane, carrying five British civilians, landed at the Allgemeine Elektricitats-Gesellschaft's aerodrome at Spandau on that morning. The machine had travelled from London via Cologne. The passengers are staying in Berlin, pending a decision by the German authorities as to whether they shall be allowed to continue their flight to Warsaw. A later account stated that that machine was piloted by a Capt. "Hearn," and was to be sold in Warsaw.

The civilian pilots of the machine are Capt E. D. C. Herne and Capt. Macnaught Davis. The Handley Page machine would have been sent by sea, but it was found too big to be carried under the bridges on the railway line from Danzig to Warsaw. Accordingly the two pilots, with two mechanics and a Swiss interpreter, set out by air.

While held up for a week by bad weather at Cologne they obtained permission from the German authorities for themselves to enter Germany, but they could not get a permit for the aeroplane. They continued nevertheless and at Paderborn, in Westphalia, an attempt was made to stop them.

Capt. Herne's account is as follows :—

"I suddenly saw two German machines in full war paint, Iron Crosses and all, making for us. They flew close alongside, the pilots motioning to us with their hands to land. We did not want any explanations except with the proper authorities in Berlin, so we flew on, waving our hand in a friendly way.

"When the Germans saw that we were not coming down, they were furious and flew round us for 20 minutes, crossing so close as almost to graze us with their wing-tips and shaking their fists at us angrily.

"At Spandau the Germans were simply amazed to find that we were a British civilian machine and had never seen our

Reduce the time spent on engine overhaul. Valves need the minimum of attention if they are made of

They will withstand great temperature without burning, pitting, scaling or stretching.

THOS. FIRTH & SONS LTD., SHEFFIELD.

THE TIELOCKEN AIR-WARM

The Tielocken Air-Warm

Illustrated Catalogue & Patterns Post Free.

A smart and thoroughly serviceable flying coat that, made in exclusive Burberry cloth—the same as worn by Sir John Alcock on his Transatlantic Flight—lined throughout with lightweight fur, provides Pilot or passenger with an impregnable safeguard that ensures dependable protection, warmth and comfort under the severest conditions.

The materials are especially woven for air work, and withstand intense pressure from wet or wind without the aid of rubber or other air-tight agents which, by preventing hygienic ventilation, induce condensed moisture and consequent injury to health.

The Tielocken Air-Warm by means of overlapping fronts, doubly shields every vital area of the body. Another advantage is its unique method of fastening, which consists solely of a strap-and-buckle—no buttons to fasten or lose.

Flight or Mufti Kit to Order in 2 to 4 Days or Ready-to-Wear.

Every Burberry Garment is labelled "Burberrys."

international markings before, but they treated us very well, gave us hot drinks, and drove us to Berlin."

The German authorities had to refuse to allow the aeroplane to continue to Warsaw on Dec. 14th, as it was impossible to warn the frontier guards in time.

HAVANA.

A company has been formed in Havana, financed by Senor H. S. Mesa, a wealthy Cuban, for the establishment of a passenger air service to Cuba, Miami (Florida), and New York. It was announced in some New York newspapers that six three-passenger and two sixteen-passenger machines are to be used on the service.

ITALY.

The Government Competition.

The Italian correspondent of THE AEROPLANE writes :—

Details of the long-promised Government Competition for aeroplanes are being divulged. Briefly, the powers that rule are plumping for a small land aeroplane and a very big hydro-aeroplane. Presumably, the S.I.A.I. pluri-motored flying-boat, which is said to be of big dimensions, and two, or possibly three, large craft from down South, of which one hears vaguely, fill the latter part of the programme, not forgetting the Caproni hydro-triplane, with its many engines.

The Paris Aero Show.

What the F.I.A.T. have in store is more likely to be seen at the Paris Show than here. The new star-radial-engine is said to be making its debut there, and two or more of the latest big flying machines, including the Transatlantic type, which will run the risk of getting into the midst of the strike fiend by travelling tortoisewise. Perhaps its power plant will acquire a healthy taste for heavy oil fuel from the French locomotives, which may be all to the good of the breed.

The Tripoli Escadrille.

It is reported that one of the seaplanes belonging to the Tripoli escadrille recently covered the distance of 1,000 kilometres between that place and Bengasi in 7 hr. non-stop with three up. As usual, the weather conditions, as in all health resorts, were unfavourable and quite unusual. But, anyhow, I am told all sorts of good things as to this escadrille's hard battle with obstacles, human and material, which would appeal to any equipment officer who had tried to get things organised.

The Pilots' Trade Union.

Col. Piccio writes that he did not accept the post of President of the Roman Pilots' Trade Union, which, instead, was conferred on Col. Ferrari.—T. S. H.

SOUTH AMERICA.

According to the "Times" of Dec. 13th a regular air service has been inaugurated between Buenos Aires and Montevideo by members of the French Aviation Mission.

SPAIN.

The Necessity for Passports.

The Ministry of the Interior has issued instructions that the pilots and passengers of foreign aircraft landing in Spain are to be asked to produce their passports. If they fail to show these papers they are to be detained pending instructions from the Ministry. There is no difficulty in obtaining passports to Spain, and plots are advsed to comply strictly with the regulations in these matters.

A Madrid—London Flight.

The following account of their flight from Madrid to London in a "Vickers-Vimy Rolls" bombing aeroplane is given by Capt. Cockerill and Capt. Broome :

We left Madrid on the morning of Dec. 4th in thick mist, and, flying above this and clouds, crossed the Guadarama Mountains at 7,000 feet. We flew by a compass course above the clouds for 1½ hours, and then came through and found ourselves at Aranoa. We made Vittoria in 2 hours 40 min. The aerodrome at Vittoria was very wet. The machine got bogged, and it took one day to get out of it.

We left Vittoria for Bordeaux on Dec. 5th, crossed the Pyrenees above the clouds on compass course, and came through the clouds about six miles out to sea off Orio. On arrival at Bordeaux we found the aerodrome under water, so decided to make Paris. On the way we found the light failing, and so landed at Tours 4 hours 40 min. after leaving Vittoria.

On the next day (Dec. 6th) we made Paris in two hours. The weather was very bad, with clouds at 500 ft., and rain and snow the whole way. We left Paris on Dec. 8th in a 40-mile-an-hour gale, ran into several bad storms, and were forced to land at Marquise after 3 hours 50 min. against the gale.

We left for London on the morning of Dec 9th in thick mist and against a head wind. On reaching Chatham the mist was so bad that we could not see ground from 300 ft., so flew on compass and reached Hendon 1¼ hours after leaving Marquise.

SWEDEN.

Lieut.-Col. G. L. P. Henderson, M.C., A.F.C., R.A.F., who has been flying from London to Stockholm, has been delayed considerably by exceptionally bad weather, having arrived in Scandinavia just at the season when the weather is changing over from the settled weather of autumn to the settled cold weather of winter. Between Hamburg and Stockholm he flew for many miles through snow-storms, and was either compelled to lose sight of the ground altogether, or to fly within 100 feet or so of the tree-tops. It speaks well for his 160-h.p. Beardmore engine that despite the appalling weather through which it has passed, it has never given him a moment's trouble.

Colonel Henderson remarks that there are a good many fields in Sweden in which it is possible to land, many of them quite suitable for a D.H.4, and, he adds, if it is impossible to get down safely it probably does not hurt any more in a D.H.4 than in an "Ack-W." to get the top of a pine tree stuck up through the floor! He believes that in summer, with the corn growing, it would be difficult to find a good landing ground, and in some places landing is impossible for stretches of 20 and 30 miles, and he therefore recommends seaplanes for flying in Sweden.

The obvious difficulty in selling British aeroplanes in Sweden is that one can buy two twin-engined German seaplanes for the price of one single-engined British seaplane.

UNITED STATES OF AMERICA.

The following notes are taken from "Automotive Industries" of Oct. 23rd :—

Weather Forecasts.

A daily weather forecast for fliers has been inaugurated by the Weather Bureau of the United States Department of Agriculture. The country has been divided into thirteen zones and the forecasts are sent out for each zone to the various army posts, aerodromes and publications interested. Forecasts are made at 9.30 a.m. and 9.30 p.m., and cover a period of 24 hours. They indicate whether the flying weather will be "poor" or "good," whether there is a prospect of rains or clouds and the strength and direction of the winds. In addition they estimate the strength of the winds at various altitudes.

The Aerial Mail Service.

A rebuilt De Havilland 4 mail aeroplane, fitted with a Liberty engine, made a non-stop flight of 415 miles from Cleveland to Jersey City on Oct. 17th. The distance was covered in 3 hr. 26 min., the rate of speed being 129 m.p.h. This was the longest non-stop flight ever made by a mail aeroplane.

The purpose of the voyage was to determine how much more mileage it was possible to get out of alcohol as compared with petrol. The results obtained were in keeping with the two months' flying on this synthetic fuel between New York and Washington.

An Aircraft Exhibition.

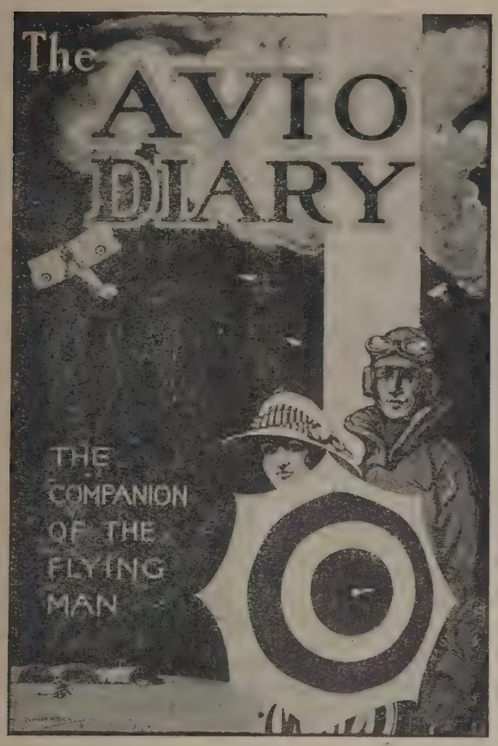
The first aeronautical exposition in 1920 will be held in Chicago during the week of Jan. 8th, and, it is said, will be the first show of its kind ever to be held outside New York. The Manufacturers' Aircraft Association of New York have announced that the exhibits will be of types mostly for the use of private owners.

Dropping Dodgers.

The following paragraphs headed Milwaukee (Wis.), Sept. 27th, are taken from "Automotive Industries" of Oct. 2nd, and left in the American language, as the narrative would only be spoilt by translation :—

"History was made in the Wisconsin dealer trade during the week when Leslie D. Frint, Oldsmobile distributer, made a real flying trip to the factory at Lansing, Mich., using his Curtiss JND4 airplane. It was the first time that a dealer or distributer in this part of the country has essayed to call on the manufacturer in this manner.

"Frint, some time ago, purchased a Curtiss flying machine and organised the L. D. Frint Aeronautical Co., to establish an aerial taxicab line. He leased a large field at North Milwaukee, built a hangar and advertised trips at $10 and upward. The ship was campaigned on the country fair circuit in Wisconsin this fall.



"Frint left at 9.42 o'clock Monday morning and arrived at Lansing at mid-afternoon, making a stop at South Bend, Ind., en route. The pilot was Lieut. H. R. Overly, late of the Army Air Service, who is now acting as Frint's aeronautical manager.

"The ship carried a large supply of red, white and blue dodgers, which were dropped from the sky as the travellers arrived over the Olds Motor Works. The dodgers were in the form of an S O. S. message, urging the plant to 'whoop 'er up' and supply more passenger cars and trucks 'I am up in the air for your answer,' said Frint, actually and figuratively, in the dodger.

"Before returning to his airport at Milwaukee, Frint intends to make a side trip to Detroit, and also to stop off at Cleveland."

NAVAL.

Admiralty, Dec. 1st.

R.M.—Capt. G. E. Wildman-Lushington returns to Corps duty from the Seconded List (R.A.F.), and will be borne supy. to estbt. until absorbed, Oct. 23rd.

MILITARY.

War Office, Dec. 9th.

Territorial Force.—Infantry.—4th Bn., Yorks. R.—Sec. Lt. D. I. B. McCullock to be Lt., and to remain secd. R.A.F., Nov. 13th, 1918.

War Office, Dec. 12th.

Regular Forces.—Infantry.—Durh. L.I.—Lt. J. B. Tait, attd. R.A.F., resigns his commn., Sept. 27th (substituted for the notification in "Gazette," Sept. 26th).

Memorandum.—Sec. Lt. J. H. Ferguson, attd. R.A.F., retires on ret. pay, Dec. 13th.

Territorial Force.—Infantry.—4th Bn., North'n R.—Sec. Lt. E. Phillips to be Lt., and to remain seconded (R.A.F.), April 25th, 1918.

War Office, Dec. 13th.

Regular Forces.—Special Reserve of Officers.—Infantry.—4th Conn. Rangers.—Lt. A. P. V. Daly relinquishes his commission on appointment to a commission in the R.A.F., Aug. 1st.

AIR FORCE.

The following relinquish their temp. R.A.F commns. on return to Army duty:—Flight Lt. A. P. Davidson (Lt., H.L.I.), Nov. 27th; Sqdn Ldr. H. E. Rudkin, O.B.E. (Maj., R. Irish Regt.), Dec. 1st.

Capt. (actg. Maj.) H. F. Atkinson-Clark, M.V.O., O.B.E. (Capt., Scots Gds.), relinquishes his commn. on ceasing to be empld., and is permitted to retain rank of Maj., Aug. 1st.

Maj. H. F. Towler (actg. Lt., R.N.R.) relinquishes his commn. on ceasing to be empld., and is granted rank of Lt.-Col., Oct. 25th (substituted for notification in "Gazette," Nov. 11th).

Transferred to unempld. list, from (S.O.):—Lt. H. F. Walker, M.B.E., Nov. 30th; Capt. G. G. Shepherd, O.B.E., Dec. 1st.

Air Ministry, Dec. 5th.

R.A.F.—The following officers have been granted short service commns. in the ranks stated, with effect from Dec. 5th. They will retain their seniority in the substantive rank last held by them prior to the grant of the short service commission.

In the case of officers now gazetted Flying Officer or Observer Officer, from Pilot Officer, seniority will date from the date of the "Gazette":—

Sqdn. Ldr.—J. P. C. Sewell, O.B.E. (A.), M. E. A. Wright, A.F.C. (A.P. (T.)).

Flt. Lts.—A. H. S. Baker, O.B.E. (S.O.), J. S. Browne (A.), B. C. Meates (A.), H. I. Hughes (T.), C. Musgrave, A.F.C. (A.), P. W. Snell, A.F.C. (A.).

Flying Officers.—F. P. Adams (A.), C. Ayling (A.), Rev. R. M. Bankes-Jones (A.), C. E. Barraclough (A.), C. O. Bird (A.), S. W. Bird (A.), G. Birkett (A.), H. Bligh (A.), V. A. Boulle (A.), W. J. Brown (A.), F. Carpenter (A.), P. J. Cox (A.), W. J. Daddo-Langlois (A. and S.), A. B. M. Dale (T.), F. G. C. Dickinson (A.), B. A. de Nevers (A.), J. MacG. Fairweather (A.), F. A. Giles (A.), A. V. H. Gompertz (A.), W. I. Hannon (A.), F. H. R. Henwood, D.F.C. (A.), R. J. H. Holland (A.), F. L. Hopps, A.F.C. (A.), W. R. S. Humphreys (T.), J. R. Jaques, M.C. (A.), A. R. Jones (A.), K. F. Pruden (A.), G. Robinson, M.C. (A.), J. A. Rudd (A.), W. W. Saunders (A.), J. A. H. Savage (S.O.), C. H. Tancred, M.B.E. (S.O.), C. H. Teagle (A.), T. A. Thornton (A.), F. D. Travers, D.F.C. (A.), S. F. A. Welsh (Ad.), H. J. Young, M.B.E. (Ad.).

Obrs. Officers.—J. C. Bulteel, B. E. Essex, A. P. Ledger, M. J. Wyatt, M.C.

Flying Officers (from Pilot Officers).—E. H. Attwood (A.), P. Bailey (A.), C. H. Billings (A.), E. Bird (A.), A. D. L. Carroll (A.), W. J. Cooke (A. and S.), G. C. W. Dufty (A.), J. B. Duminy (A.), J. Edmunds (A. and S.), C. C. Gissing (T.), V. W. Helps (A. and S.), H. S. Hobby, M.C. (A.), E. R. C. Hobson (A.), H. W. Iles (A.), D. M. I. Macarthur (A.), H. N. V. Le V. Noel (A.), W. H. L. Oxland (A.), S. H. Potter (A.), R. C. Pretty (A. and S.), H. C. Price (A.), C. O. Rigden (A.), J. H. Shaw (A.), J. Silvester (A.), M. F. Tomkins (T.), G. M. Trundle (A.), E. A. Turnbull (T.), G. W. Wilson (A.).

Obsr. Officers (from Pilot Officers).—W. A. Armstrong, E. D. Barnes, F. H. Buggé, B. C. S. Byrne, R. T. Carter, G. S. Coggan, B. G. Drake, K. H. Holley, L. W. Kitt, T. L. Lowe.

The notifications appearing in the "London Gazettes" of the dates indicated below, appointing the following officers to short service commissions, are cancelled:—Flt. Lt. N. R. Cook, D.S.C. (A. and S.); Flying Officer G. J. Fowler, A.F.C. (A.), Oct. 24th; D. S. C. Macaskie (T.), Nov. 11th.

The notification in the "Gazette" of Nov. 28th relative to Flt. Lt. E. F. Turner (T.) is cancelled, and that in the "Gazette" of Oct. 24th, appointing this officer to a short service commission, stands.

R.A.F.—The heading of the list of promotions which appeared in the "London Gazette" dated Nov. 28th should read "permanent and short service commissions, and re-seconded officers," instead of "permanent commissions."

Flying Officer W. B. Thomson (A.) is granted a permanent commn. in the rank stated, Aug. 1st.

The notification in the "Gazette" of Aug. 1st, appointing the following officers to permanent commns., is cancelled:—Capt. E. E. N. Burney, M.C. (A.), Capt. L. M. Lilley, O.B.E. (T.), Lt. M. Minter (A.), Lt. G. R. Barry (T.), Lt. D. N. Thompson, M.C. (S.O.).

The notification in the "Gazette" dated Oct. 28th, appointing the following officers to permanent commns, is cancelled:—Flt. Lt. M. R. N. Jennings, M.C., A.F.C. (A.), Flt. Lt. A. B. Shearer (A.), Flying Officer C. O. B. Beale, D.S.O. (A.).

The initials of Lt. R. H. F. S. de V. Somerset are as now described, and not as stated in "Gazettes" of Aug. 1st and Sept. 16th.

The following temp. appts. are made at the Air Ministry:—Staff Officers, 3rd Class (T.).—Flt. Lt. L. D. McKean, Nov. 13th (Q.)—Flying Officer H. J. Birtels, Nov. 24th.

The following temp. appts. are made:—Group Capt. H. C. T. Dowding, C.M.G., is graded for purposes of pay and allces. as an Area Comr., whilst officiating in comd. of an area, from Sept. 1st to Oct. 17th.

Staff Officer, 1st Class.—(Air).—Wing Comdr. C. W. Wilson, M.C., Oct. 16th.

Staff Officers, 2nd Class.—(P).—Sqdn. Ldr. H. A. Michell, O.B.E., Oct. 16th, from (S.O.), 1st Class. (Air).—Sqdn. Ldr. R. L. G. Marix, D.S.O., Nov. 12th.

Flying Branch.—Wing Comdr. W. F. MacNeece, D.S.O., D.F.C., to be Wing Comdr. (A.), from (S.O.), Dec. 4th.

Sec. Lt. E. Phillips to be Lt., Nov. 10th, 1918.

The following relinquish the temp. R.A.F. commns. on return to Army duty:—Pilot Officer (Hon. Flying Officer) A. J. Cyr (Lt., Can. Forestry Corps), May 9th; Flt. Lt. (Hon. Sqdn. Ldr.) G. Disney (Maj., Essex R.), Oct. 27th; Flt. Lt. C. C. Clark (Lt., R.F.A.), Nov. 10th; Flying Officer J. K. Smith (Lt., Lanc. Fus.), Nov. 12th; Flying Officer V. Bayley (Lt., L'pool R.), Nov. 14th; Flying Officer W. F. Nickolay (Lt., E. Yorks. R.), Nov. 17th; Flying Officer L. Gellatly (Lt., Gord. Highrs.), Nov. 20th; Wing Comdr. G. E. Todd, O.B.E. (Maj. (Bt. Lt.-Col.), Welsh R.), Nov. 27th.

Sec. Lt. J. F. M. Phillips relinquishes his commn. on ceasing to be empld., Oct. 25th.

Sec. Lt. H. A. Ball, M.M. (Lt., R.H. and R.F.A.), relinquishes his temp. R.A.F. commn. on retirement from the Army, Nov. 23rd.

Transferred to the unempld. list:—Sec. Lt. C. C. Brooks, Lt. (actg. Capt.) S. Stanger, M.C., D.F.C., Sec. Lt. C. E. Stewart, Sec. Lt. A. Tencer, Sec. Lt. A. H. Wilkinson, Feb. 1st; Lt. A. B. Hopper, March 15th (substituted for notification in "Gazette" of Sept. 16th); Sec. Lt. H. E. Fisher, April 19th; Sec. Lt. J. V. Price, April 22nd; Lt. H. B. Lilley, May 1st; Sec. Lt. L. P. Worthington, June 3rd; Ses. Lt. N. Lotter, June 14th; Lt. R. N. L. Munro, July 5th; Lt. A. Dickson, July 9th; Lt. H. M. Cartwright, July 10th; Sec. Lt. F. G. Wright, July 12th; Sec. Lt. W. Dowding, July 29th (substituted for notification in "Gazette" of Aug. 5th); Lt. A. J. Stopford, Aug. 11th (substituted for notification in "Gazette" of July 29th); Sec. Lt. D. J. Dillabough, Sec. Lt. T. Hartford, Aug. 22nd; Sec. Lt. J. F. Starkey, Aug. 29th; Sec. Lt. V. B.-P. MacCallum, Sept. 10th; Lt. W. H. Oliver, Sept. 12th (substituted for notification in "Gazette" of Nov. 7th, wherein this officer was shown as "Capt."); Sec. Lt. (Hon. Lt.) D. A. McDonald, Sec. Lt. A. G. Power, A.F.C., Sec. Lt. Le Roy Springstead, Sec. Lt. G. H. Swan, Sept. 26th; Lt. C. C. Caldwell, Sec. Lt. W. A. Grant, Sec. Lt. A. H. McDonal, Lt. H. W. Price, Sec. Lt. A. H. Smith, Sec. Lt. G. R. Spradbrow, Sec. Lt. A. Strachan, Sec. Lt. H. C. Sweetman, Sept. 28th; Lt. E. F. H. Davis, Lt. G. M. McWilliams, Sec. Lt. E. G. Shafer, Sec. Lt. H. J. Smith, Capt. G. L. E. Stevens, Sec. Lt. D. Stevenson, Lt. H. E. Stewart, Lt. G. Stocks, Lt. E. C. R. Stoneman, D.F.C., Sec. Lt. R. Williams, Lt. W. Windrum, Sept. 29th; Sec. Lt. J. W. Chadwick, Lt. P. M. Tudhope, D.F.C., Oct. 6th; Capt. W. Lambert, Sec. Lt. F. C. McConnell, Oct. 7th; Capt. Lord Alington, Oct. 12th (substituted for notification in "Gazette" of Nov. 14th); Sec. Lt. W. E. Lewis, Oct. 17th; Sec. Lt. H. Edge, Oct. 31st; Lt. W. P. The notification in the "Gazette" of Oct. 14th concerning Maj. A. K. Robertson is cancelled.

The notifications in the "Gazette" of Nov. 7th concerning the following officers are cancelled:—Lt. W. S. Campbell (notification in "Gazette" of Oct. 24th to stand); Sec. Lt. (Hon. Lt.) E. Lawson (notification in "Gazette" of Nov. 25th to stand); Sec. Lt. W. C. Taylor.

ADMINISTRATIVE BRANCH.—Flight Lts. to be Flight Lts., from (S.O.): H. W. M. Paul, O.B.E., M.C., Oct. 13th (substituted for notification in the "Gazette" of Nov. 18th); G. C. Anne, O.B.E., Oct. 18th.

Sec. Lt. (Hon. Lt.) E. T. Fielding to be Sec. Lt. (Hon. Lt.), from (T.), from May 1st to Sept. 17th, and is graded for purposes of pay and allowances as Capt. whilst empld. as Capt., from May 1st to Sept. 17th.

Lt. C. M. McGorrery to be Lt., from (O.), Dec. 18th, 1918 (substituted for notification in the "Gazette" of March 4th).

Flying Officers to be Flying Officers, from (S.O.), Oct. 18th:—C. S. Fulton, W. Myers, M.C., D.C.M., (Hon. Flight Lt.) H. Pallett, and to be Hon. Flight Lt., A. G. Stradling, R. W. Ward, B. H. Godfrey, Nov. 12th; Flying Officer E. G. Williams to be Flying Officer, from (A.), Oct. 27th.

Sec. Lts. to be Lts.:—T. Gill, Oct. 22nd, 1918 (substituted for notification in "Gazette" of July 29th); A. L. Kidd, May 4th; W. E. G. Heanley, M.B.E., July 10th.

Sec. Lt. (Hon. Lt.) T. Mumford to be actg. Lt. whilst empld. as Lt., Aug. 8th, 1918 (substituted for notification in "Gazette" of Oct. 29th).

THE FLYING PUBLIC at PARIS will have another opportunity of witnessing next week the wonderful flying qualities and constructional features of the famous **KANGAROO.**

Sec. Lt. S. A. Hipple (late Gen. List, R.F.C., on prob.) is confirmed in rank as Sec. Lt., March 1st.

Capt. (Hon. Maj.) T. M. Koss (Qrmr. and Maj, Dragoons) relinquishes his commn. on ceasing to be empld., Nov. 19th.

The following relinquish their temp. R.A.F commns. on return to Army duty :—Lt. C. E. Bright (Lt. (actg. Capt.), E. Lancs. R.), Feb. 8th; Flight Lt. K. B. Harbord (Capt., R.F.A.), Nov. 23rd.

Transferred to the unempld. list :—Lt. F. J. E. Brake (R.G.A., S.R.), Feb. 1st (substituted for notification in "Gazette" of Nov. 18th, wherein this officer's rank was shown as Sec. Lt.); Capt. A. W. Barrington-Foote, July 11th; Lt. D. F. Hurr, M.C., July 18th; Sec. Lt. G. A. McGillivray, Aug. 22nd; Sec. Lt. O. J. Dean, Aug. 23rd; Sec. Lt. T. D. Drury, Aug. 25th; Sec. Lt. B. J. Pearn, Aug. 31st; Lt. C. L. De Beer, Sept. 10th; Lt. G. A. F. Hudson, Sept. 11th; Lt. S. De Freitas, Sept. 20th; Sec. Lt. W. E. Blackett, Capt. W. R. C. Da Costa, Sept 29th; Lt. H. D. Duncan, Oct. 11th; Sec. Lt. J. Birtwistle, Oct. 12th; Lt. S. J. Dodson, Oct. 20th; Sec. Lt. A. H. Betteridge, Oct. 23rd; Sec. Lt. R. P. Briscoe, Nov. 9th; Lt. (actg. Maj.) F. T. Chapman, Sec. Lt. E. U. Poyser, Nov. 11th; Lt. A. G. W. Grantham, Nov. 15th; Sec. Lt. H. G. Brodie, Lt. J. B. V. Clements, D.F.C., Nov. 17th; Lt. S. A. E. Cowell, Sec. Lt. J. P. Nolan, Nov. 21st; Sec. Lt. E. J. K. Boden, Nov. 22nd; Sec. Lt. G. W. C. Dawson, Nov. 28th; Capt. J. W. J. Ashton, Nov. 29th.

Lt. C. S. Bignell relinquishes his commn. on account of ill-health (caused by wounds), and is granted the rank of Capt., Dec. 2nd.

Sec. Lt. A. F. P. James relinquishes his commn. on account of ill-health, and is permitted to retain his rank, Dec. 1st.

The notification in "Gazette" of Nov. 7th concerning Capt. E. P. L. Baker is cancelled.

Technical Branch.—Wing Comdr. (actg. Group Capt.) A. V. Bettington, C.M.G., relinquishes actg. rank of Group Capt. on ceasing to be empld. as Group Capt., Nov. 17th.

Sqdn. Ldr. F. H. Unwin, O.B.E., to be Sqdn. Ldr., Grade (B), from (S.O.), Oct. 18th.

The following Capts. are graded for purposes of pay and allowances as Majs. whilst empld. as Majs., Grade (A) :—A. M. Low, May 1st; H. L. Rutty, from May 1st to July 31st.

Sec. Lt. R. G. Meech is graded for purposes of pay and allowances as Capt. whilst empld. as Capt., Grade (A), from May 1st to Aug. 28th.

Sec. Lt. C. W. Bentley to be Lt., Grade (A), May 16th (substituted for notification in "Gazette" of July 29th).

Sec. Lts. to be Lts. :—P. A. Edmonds, R. H. B. Tomlinson, May 16th.

Sec. Lts. to be actg. Lts. whilst empld. as Lts., Grade (A) :—R. J. Shanks, from April 1st, 1918, to Aug. 31st, 1918; (Hon. Lt.) P. A. Albrecht, June 22nd, 1918, to Feb. 27th.

Sec. Lt. J. Parsons is graded for purposes of pay and allowances as Lt. whilst empld. as Lt., Grade (A), from Feb. 15th to July 21st.

Lt. (Hon. Capt.) W. C. Green, M.C., to be Lt., Grade (B), from (Ad.), July 1st (substituted for notifications in "Gazettes" of July 29th and Sept. 12th).

Sec. Lt. F. Denham to be actg. Lt. whilst empld. as Lt., Grade (B), from Sept. 30th, 1918, to April 30th (since demobilised).

Pilot Officer (actg. Flying Officer) L. Freeborn, M.B.E., relinquishes actg. rank of Flying Officer on ceasing to be empld. as Flying Officer, Grade (A), Nov. 22nd.

Sec. Lt. A. G. Allan to be Sec. Lt., Grade (A), from (Ad.), Aug. 10th, 1918.

Sec. Lt. H. L. Vahey to be Sec. Lt., Grade (A), from unempld. list, Nov. 6th, with prec. next below S. Maunder.

Pilot Officer J. H. Furniss, M.B.E., relinquishes the grading for pay and allowances of Flight Lt. on ceasing to be empld. as Flight Lt., Grade (B), Nov 30th.

Flight Lt. P. P. Gaskell relinquishes his commn. on ceasing to be empld., and is permitted to retain his rank, Sept. 22nd.

Sqdn. Ldr. A. W. Colley (Maj., N. Lancs. R.) relinquishes temp. R.A.F. commn. on return to Army duty, Nov. 20th.

Transferred to the unempld. list :—Capt. H. B. Griffiths, April 1st; Sec. Lt. D. Humphrey, May 20th; Sec. Lt. G. D. Croskery, July 17th; Lt. C. S. McFie, Aug. 5th; Capt. P. W. Goodchild, Sept. 4th; Lt. P. M. H. Currie, Sec. Lt. G. W. H. Hogan, Sept. 28th; Lt. A. P. Beal, Sec. Lt. E. B. McLaren, Sept. 29th; Lt. B. H. McLeod, Oct. 2nd; Sec. Lt. W. J. Mabey, Oct. 4th; Sec. Lt. A. S. Kessler, Oct. 6th; Lt. D. Richardson, Oct. 30th; Lt. W. W. Bull, Maj. J. Dickson, O.B.E., Nov. 1st; Lt. W. E. N. Clark, Nov. 10th; Lt. C. P. W. Jolliffe, Nov. 11th; Lt. F. Begley, Nov. 12th; Sec. Lt. E. Barter, Nov. 15th; Lt. H. C. Bishop, Sec. Lt. W. J. Brittain, Lt. A. S. Hooppell, Nov. 16th; Sec. Lt. A. F. B. Cannon, Nov. 18th; Sec. Lt. H. G. Bill, Sec. Lt. E. A. Masters, Nov. 19th; Lt. W. W. McDonald, Lt. H. A. B. Miller, Nov. 20th; Capt. C. A. Proctor, Nov. 20th.

Sec. Lt. (Hon. Lt.) M. W. J. Kelly relinquishes his commn. on account of ill-health (caused by wounds), and is permitted to retain the rank of Lt., Dec. 2nd.

Lt. J. G. Proger is dismissed the Service by sentence of a General Court-Martial, Oct. 23rd.

The notification in the "Gazette" of Nov. 7th concerning Sec. Lt. E. W. Barton is cancelled.

Medical Branch.—Flight Lt. (actg. Sqdn. Ldr.) W. Darling, M.C., to be actg. Wing Comdr. whilst specially employed, Nov. 1st.

Flight Lt. (actg. Sqdn. Ldr.) H. M. S. Turner, M.B.E., to be actg. Wing Comdr. whilst so empld., Dec. 1st.

Flying Officers to be Flight Lts. :—P. C. Parr, Aug. 14th; M. Hyman, Oct. 31st; A. Briscoe, Nov. 19th; E. G. O'Gorman, Nov. 21st; C. McC. Jones, Nov. 25th; S. G. Seymour, Nov. 26th; W. E. Sheil, Nov. 27th.

Transferred to the unempld. list :—Capt. J. A. Johnson, Nov. 12th; Lt. M. M. Price, Nov. 19th.

The surname of G. Packham is as now described, and not "Packman," as stated in "Gazette," Aug. 8th, 1918.

Chaplains Branch.—The Rev. B. W. Keymer, O.B.E., relinquishes appt. of Deputy-Chaplain-in-Chief and relative rank of Sqdn. Ldr. on ceasing to be empld. as Deputy-Chaplain-in-Chief, and reverts to rank of Chaplain, with relative rank Flight Lt., Oct. 20th.

The Rev. J. L. Thomas, M.C., is transferred to unempld. list, Nov. 29th.

Memoranda.—Overseas Cadet 91666 R. M. Haldane is granted an hon. commn. as Sec. Lt., Jan. 31st.

The following Probty. Flight Officers are granted hon. commns. as Sec. Lts. :—H. J. Drew, Feb 23rd; N. J. C. Clark, H. Knight, March 7th; E. W. Alston-Smith, April 11th; N. G. Durham, May 19th.

The following Cadets are granted hon. commns. as Sec. Lts. :—180280 A. R. Lusk, Jan. 6th; 176317 R. M. Campbell, Jan. 15th (substituted for notification in "Gazette," Aug. 19th, wherein this cadet's number was stated as 126312); 318632 D. J. Sherlock, March 26th; 176117 H. E. Rees, March 27th; 175125 T. I. Hodge, April 4th (substituted for notification in "Gazette," May 30th, wherein this cadet was described as 17125 T. T. Hodge); 37081 W. P. G. Branson, May 31st; 11395 W. E. Smith, Sept. 14th.

Wing Comdr. J. W. O. Dalgleish, O.B.E., is placed on half-pay list, Dec. 10th.

Air Ministry, Dec. 12th.

R.A.F.—The following officers have been granted short service commissions in the ranks stated, with effect from Dec. 12th. They will retain their seniority in the substantive rank last held by them prior to the grant of the short service commission.

In the case of officers now gazetted Flying Officer or Observer Officer, from Pilot Officer or Probationary Flight Officer, seniority will date from the date of "Gazette" :—

Flight Lts.—G. H. Hooper, M.C., D.F.C. (A.); C. T. Lally, M.C., A.F.C. (A.); C. E. M. Pickthorn, M.C. (A.); E. M. Pollard (A.); F. J. Powell, M.C. (A.); R. S. Smith (K.B.)

Flying Officers.—G. H. Allison (A.); M. Ballard (A.); G. C. Bladon (A.); M. Burbidge (A.); R. Clelland (T.); J. Cottle, D.F.C. (A.); F. H. Davies, M.C. (A.); N. L. Desoer (A.); L. C. Dodkins (A.); C. A. Elliott (T.); E. T. H. Ellis (A.); W. V. N. Grant (A.); B. R. Harris (A.); L. N. Hollinghurst, D.F.C. (A.); J. S. Hughes (A. and S.); S. Jones, D.F.C. (A.); H. R. Junor, D.F.C. (A.); E. G. Keeping (A.); J. L. Kirby (A.); I. E. McIntyre, A.F.C. (A. and S.); H. W. McKenna, D.C.M. (T.); G. Martyn (A.); A. Miller (A.); J. L. Montgomery (A.); F. A. Norton (A. and S.); C. S. Oddie (A.); R. M. Rankin (A.); N. M. S. Russell (A.); A. W. Saunders, D.F.C. (A.); W. J. Seward (A.); O. E. Sharpe (A.); B. E. S. Smith (A.); R. de L. Stedman (A.); C. F. Toogood (A.); F. R. Wynne (A.).

Observer Officers.—H. A. Cooper, M.C., A. J. Cox, R. S. Greenslade, E. Major Greenwood, W. G. Hanton, P. Hardy, M.C., R. McK. Jamison, D.F.C., C. H. F. Nesbit, G. L. Nicholson, J. J. W. Nicholson, D.F.C., A. E. Reynolds, A. D. Sinclair, G. R. Terry, A. F. Wynne.

Flying Officers (from Pilot Officers).—E. A. C. Britton (A.); H. A. Dinnage (T.); F. R. Eason (A.); D. D. MacA. Eastwood (A.); E. N. Fenton (A.); H. W. Gill (A. and S.); D. E. Hall (A. and S.); E. N. Hewitt (T.); C. E. Howley (A.); D. G. R. Lord (A.); J. A. McDonald (T.); J. W. F. Merer (A.); W. Parkinson (T.); W. E. Purdin (A. and S.); B. H. C. Russell (A.).

Observer Officers (from Pilot Officers).—H. Alexander, L. W. Beck, C. G. Boothroyd, D.F.C., F. W. Brown, R. A. Brunton, M.C., A. H. Darnbrough, J. Davison, L. J. Hoare, W. McGowan, B. J. Malyan, D. H. Murray, R. T. Rich, H. Taylor, M.C., A. L. Wilcox.

Flying Officer (from Prob. Flight Officer—Late R.N.A.S.)—D. C. Duncan (A.).

(To be continued.)

PERSONAL NOTICES.

MILITARY.

Engagements.

FLOOD-PAGE—BREACH.—The marriage arranged between Philip Horsley Flood-Page (late captain, R.A.S.C., T.F., and R.A.F.) and Barbara (Betty), youngest daughter of Mr. and Mrs. W. Powell Breach, of Newham, Steyning, will take place at Steyning on Jan. 10th.

LEATHLEY—FOSTER.—A marriage has been arranged, and will shortly take place, between Mr. Forde Leathley, M.C., R.A.F., son of the Rev. J. Forde Leathley, Rooske, Dunboyne, Meath, and Ida, daughter of the late Mr. George Edward Foster and Mrs. Foster, of 7, Bickenhall Mansions, W.

Marriage.

WHEATLEY—HODGKINSON.—On Dec. 4th, at All Souls Church, Langham Place, Lieut. E. S. Wheatley, D.F.C., son of Col. H. S. Wheatley, C.B., S.M., of The Knoll, Farnham, was married to Dorothy, eldest daughter of Dr. Alexander and Mrs. Hodgkinson, of Bradshaigh, Farnham, Surrey, formerly of Manchester and Wilmslow.

AIR FORCE.

Death.

HALLINAN.—Capt. Charles Joseph Hallinan, late R.A.F., who died on Dec. 7th at the Mercy Home, Cork, was the elder son of Patrick Hallinan, of Cloonmullin, Midleton.

Engagements.

MACKENZIE—METFORD.—The engagement is announced between Capt. R. M. B. Mackenzie, R.A.F., youngest son of the late H. A. O. Mackenzie, and of Mrs. Mackenzie, of Belsize Park, Hampstead, and grandson of the late Sir George Mackenzie, Bart., of Coul, and Margaret Cecilia, only daughter of the Rev. G. A. S. Metford (late Minor Canon, and Sacrist of Bristol Cathedral) and Mrs. Metford, of St. Michael's Rectory, Sutton Bonington, Notts.

RIDLEY—BOLTON.—An engagement is announced between Lieut. D. L. Ridley, R.A.F., elder son of Mr. and Mrs. W. E. Ridley, of Heathfield, Coulsdon, Surrey, and Leslie, younger daughter of Mr. and Mrs. St. Clair Bolton, of 6, Hyde Park Mansions, W.

Marriages.

HOWETT—ALDRICH.—On Dec. 10th, at the Catholic Church, Farnborough, Capt. J. R. Howett, R.A.F., youngest son of Mr. and Mrs. R. Howett, of Market Harborough, was married to Hilda May, youngest daughter of Mr. and Mrs. W. A. Aldrich, Woolwich, by the Rev. Father Giltinan.

URQUHART—WILSON.—On Dec. 10th, at St. Anne's Church, Aigburth, Lieut. Frank Alexander Urquhart, R.A.F., of Edmonton, Alberta, was married to Geraldine Lucy Milne, elder daughter of Colonel G. Adshead Wilson, V.D., and Mrs. Wilson, of Aigburth, Liverpool, by the Rev. Canon W. E. Sims, M.A., Vicar.

DEC. 24, 1919.

THE AEROPLANE

VOL. XVII. No. 26.

The Editorial and Advertising Offices of "The Aeroplane" are at 175, Piccadilly, London, W.1.
Telegraphic Address: "Aileron, London." Telephone: Gerrard, 5407.

Accounts, and all correspondence relating thereto, should be sent to the Registered Offices of The Aeroplane and General Publishing Co., Ltd., Union Bank Chambers, 61, Carey Street, London, W.C.2.

Subscription Rates, post free: Home, 3 months, 7s. 6d.; 6 months, 15s.; 12 months 30s. Foreign, 3 months, 8s. 9d.; 6 months, 17s. 6d.; 12 months, 35s. Canada, 1 Year, $8. U.S.A., 1 Year, $8 50c.

APROPOS DES OEUVRES DES CONSTRUCTEURS BRITANNIQUES D'AEROPLANES.

Parceque nos amis français—pour toujours nos Alliés dans les guerres futures, bien qu'aujourd'hui nos rivaux dans le monde commercial—jouissent du succès bien mérité d'une exposition aéronautique à laquelle quelques uns seulement des membres de la " Society of British Aircraft Constructors " sont représentés, il semble opportun de passer brièvement en revue ce que les dessinateurs britanniques d'avions ont fait dans le passé pour développer l'art et la science de voler et pour améliorer et perfectionner les aéroplanes et les aéro-moteurs.

Il est admis que le crédit des premières vraies connaissances acquises dans les airs au moyen des planeurs appartient à l'Allemagne, grâce à feu le regretté Professeur Otto Lilienthal. Il est admis que le crédit du premier vol en aéroplane à force motrice appartient aux Etats-Unis, grâce aux frères Wright. Il est admis que les vols pleinement controllés et les premiers faits acrobatiques dans les airs se placent aussi au crédit des Etats-Unis, grâce aux planeurs de feu le Professeur Montgomery. Il est admis que le premier essor donné à l'aviation est au crédit de la France, grâce aux frères Voisin, Louis Blériot, Henri Farman, feu Léon Delagrange, feu le Capitaine Ferber et grâce au support financier de feu Henri Deutsch de la Meurthe. Il est admis que les usages pratiques de l'aviation ont émané de la France grâce au moteur Gnome dû aux frères Seguin. Mais bien que la Grande Bretagne n'ait eu aucune part active dans tous ces développements, il est juste d'attribuer aux dessinateurs britanniques le crédit d'avoir fait l'aéroplane moderne ce qu'il est.

Les Premiers Biplans et Triplans.

Au crédit d'un dessinateur d'aéroplane purement britannique se place le remarquable succés de la production du triplan Avro de 1909 et le début de 1910. C'est l'avion que Mr. A. V. Roe pilota si bien avec un J.A.P. Moteur de 8 cylindres. Cet appareil lorsque construite en 1910 avec un moteur Green de 35 h.p. était indubitablement un des meilleurs avions de son temps, et était au fait le premier triplan satisfaisant.

Ce point est spécialement important et digne d'attention, parcequ'il est probable que l'arrangement de la surface des ailes dans un triplan jouera un role important dans le développement des grands avions de l'avenir. Ce point est également digne d'attention par le fait que durant la guerre les triplans ont été employés avec tant de succés par toutes les armées.

En 1911 Mr. A. V. Roe produisit son biplan avec le même moteur Green de 35 h.p. et de cet appareil dérivent certainement tous les biplans à hélices tractives qu'on emploie avec succès aujourd'hui. Et en rapport avec ce fait, il est spécialement intéressant de noter ici que le biplan Avro de ce jour, connu officiellement sous la dénomination Type 504K., qui est le successeur immédiat du petit appareil à moteur Green via l'appareil à moteur Gnôme de 80 h.p. de 1913, est sans aucun doute l'aéroplane le plus en usage par le monde entier. Il ne peut y avoir que trés peu de pays ou l'Avro n'est pas en usage courant. Il est certainement employé dans les limites du cercle arctic et également dans l'afrique du Sud et en Australie, du côté opposé de l'équateur. Il était employé comme avion type pour l'entrainement pendant la guerre et depuis l'armistice ce type d'appareil a transporté plus de passagers civils qu'aucun autre type d'aéroplane. Ceci sans un seul accident fatal.

Dans son genre, aucun appareil n'a atteint le succès de l'Avro. Il est aussi digne de remarquer le fait que, en 1912 Mr. Roe produisait le premier appareil entièrement fermé, ou " limousine,"," un nouveau type d'avion.

Les Premiers Hydravions Satisfaisants.

La Grande Bretagne peut aussi revendiquer une place prépondérante dans une catégorie de travail tout à fait différente. Il est admis que le premier avion s'élevant de l'eau était un " Curtiss," dessiné, construit et piloté par notre estimé ami Glenn Curtiss. Mais le plus grand développement des Hydravions est au crédit de Short Brothers. Aucune autre firme ne s'est consacrée aussi complètement ni pour une aussi longue durée de temps au travail des hydro-aéroplanes.

Feu Horace Short consacra son étonnante intelligence, qui avait déja perfectionné la turbine à vapeur, à la production d'un aéroplane assez fort pour traverser la mer, et le premier biplan à hélice tracteur Short avec le moteur Gnôme de 80 h.p. en fut le résultant en 1912. Celui-ci fut suivi par toute une série de hydravions avec doubles Gnômes de 160 h.p. 14 cylindres, moteurs Salmson à cylindres radials de 150 h.p., et plus tard avec les Sunbeams, d'abord de 150 h.p., puis 225 h.p., et plus tard encore, vers la fin de la guerre, de 260 h.p.

C'est avec ces trois derniers types qu'ont été faits presque tous les travaux navals dans l'air, soit bombarder les villes cotières allemandes, soit patrouiller la Mer du Nord et la Manche en quête de sous-marins, soit bombarder les positions allemandes sur la côte belge, soit patrouiller la Méditerrannée, soit établir un barage dans l'Adriatique, soit observer les positions ennemies en Bulgarie et en Gallipolie, soit photographier et bombarder les lignes de chemin de fer à 100 miles à l'interieur du pays en Palestine, soit corriger un bombardement dans l'Est africain allemand, soit faire des recherches dans l'Océan Indien pour découvrir les destroyers des navires commerciaux, soit patrouiller en Mésopotamie, soit distribuer des vivres dans Kut ou lancer des torpilles dans la mer de Marmora. A vrai dire une étonnante variété de travaux.

Les Premiers Appareils a Ailes Pliantes et les Premiers Appareils a Torpilles.

C'est aux Short Brothers qu'appartient le succés des premières ailes pliantes. Ce simple arrangement jouera un plus grand rôle dans l'aviation commerciale que dans la guerre, car dans le commerce l'espace comme le temps vaut de l'or.

C'est encore aux Short Brothers qu'appartient le premier succès des flotteurs á pontons. Plus tard c'est encore les appareils Short qui sont les premiers lanceurs de torpilles.

Les Premieres Ailes Variables.

C'est à un disciple de Horace Short, C. R. Fairey, un génie d'une plus jeune génération que revient l'honneur d'avoir construit une aile à courbature variable, donnant un atterrissage lent et un plus grand essor au départ., ceci, permettant d'obtenir un hydravion fonctionnant avec la facilité d'un aéroplane de grande vitesse. Ici nous nous trouvons de nouveau devant une question qui aura encore plus d'importance en temps de paix qu'en temps de guerre.

C'est aussi a C. R. Fairey que doivent être attribués les dessins du plus grand aéroplane du monde, un bateau-volant comprenant 5 moteurs Rolls-Royce "Condor" de 600 h.p. chacun. Ce géant de 3,000 h.p. est, parait-il, presque prêt pour l'expérimentation. Au fait la machine aurait déja pris son vol plusieurs mois, si ce n'etait que la firme Rolls-Royce est plus difficile à satisfaire quant à la perfection de ses propres moteurs que ne le sont ses clients, et c'est ainsi que les expérimentations ont été remises jusqu'au moment où la firme Rolls-Royce sera certaine que le "Condon" est un digne companion pour le "Eagle" et "Falcon."

Le Premier Grand Avion de Combat.

Nous reportant une fois de plus au debut de l'ère de l'aviation, nous trouvons une firme britannique qui certés a guidé le monde dans son genre de travail. "The British and Colonial Aeroplane Co.," plus généralement connue sous le nom de "Bristol Co.," a établi sa réputation en 1910 et 1911 comme constructeurs des fameux Bristol "Box-kites," de simples biplans construits strictement d'après les plans du biplan Farman, et renommé par la perfection de sa main d'œuvre.

Le premier appareil construite d'après un dessin de la firme même, dessin dû à l'eminent dessinateur Frank Barnwell, la "Bristol Bullet" fit rapidement son nom comme étant le mono-place le plus rapide de son temps, bien qu'il ne fut pas généralement employé pendant la guerre. Mais cette apparente indifférence pour une aussi bonne machine est compensée par le remarquable succès du "Bristol Fighter" qui plus que tout autre avion contribua à assurer la domination des airs au Royal Flying Corps en 1917.

Pourvu du moteur Falcon de la firme Rolls-Royce, ce biplace de combat avait tous les avantages d'un monoplace. Il était si rapide et si manœuvrable, sa résistance et la qualité de sa main d'œuvre si parfaites, que les pilotes le montaient avec une confiance inébranlable et l'employait pour chasser l'ennemi comme personne n'avait pu le faire jusqu'alors dans un biplace. Depuis la cessation de la guerre cet appareil a été modifié et transformé en un appareil de voyage des plus comfortables, ses grandes qualités aérodynamiques considérables le rendant très utile pour cet emploi.

Le dernier succès notable de la "Bristol Co." est le grand triplan "Braemar" un avion de luxe pour passagers, à quatre moteurs. Ce dessin britannique se distingue par le fait que cet appareil est de beaucoup le plus rapide et le plus facile à manier des triplans à plusiers moteurs, tous les autres avions de ce type étant plus lents et peu dociles au maniement.

Le Premier Biplan de Grande Vitesse.

Un autre pionier de l'aviation britannique peut revendiquer une innovation qui marque une époque dans l'ère des dessin d'avions. Le premier de tous les petits avions qui volaient avec succès, était le "Tabloid" de Sopwith, avec un moteur Gnôme de 80 h.p. Cet appareil était dû aux efforts combinés de T. O. M. Sopwith, H. G. Hawker et F. Sigrist. Cet appareil atteignait une vitesse maximum de 95 miles par heure et une vitesse minimum de 40 miles par heure, un écart de vitesse qui jusqu'alors avait été considéré impossible. De ce type proviennent tous les "destroyers," les "appareils de chasse," les "appareils de poursuite" de toutes les nations belligérants. Et cet appareil type peut à juste titre être considéré comme l'ancêtre de tous les petits avions de bas prix du temps présent et de l'avenir.

Le premier descendant direct du "Tabloid" était l'avion dans laquelle C. H. Pixton remporta le trophé Schneider pour Hydravions en 1914. Ce petit hydravion, avec moteur monosoupape Gnôme de 100 h.p., étonna les dessinateurs d'avions à Monaco, et c'est de cet appareil que dérivent tous les petits hydro-aéroplanes, depuis le type Schneider de la R.N.A.S. jusqu'au vicieux petit appareil allemand "Brandenburger."

Si nous considérons l'arbre généalogique des avions pour traversées au dessus des terres, nous voyons que le "Tabloid" est l'ancêtre du "Pup," du "Camel" et du "Snipe" chacun de ces appareils étant à son tour le principal avion de chasse de la guerre.

Dans l'ère de la paix son dernier degré de parenté est l'avion anonyme construite pour la malheureuse course pour le Schneider trophé de cette année, pourvue d'un moteur Cosmos du nom de "Jupiter." Depuis que des roues ont remplacé dans cette machine les flotteurs, elle a atteint une vitesse avec laquelle elle se range probablement comme l'appareil le plus rapide du monde entier.

Le Premier Appareil de Grande Vitesse a Longs Relais.

Nous retournant dans une autre direction, nous trouvons une des premières firmes britanniques de dessinateurs d'avions figurant au premier rang par leur mérite. H. P. Martin et G. H. Handasyde commencérent à construire leur premier avion en 1908. Plus tard ils produisirent un grand monoplan, qui, avec sa forme "Antoinette," se range comme la machine la plus belle et la plus minitieusement achevée de son temps.

Au début de la guerre, les associés, connus comme maintenant d'ailleurs sous le nom de la Martinsyde Co., construisirent un petit monoplace à moteur Gnôme, spécialement dessiné en vu d'obtenir une grande résistance, pouvant supporter le manque d'adresse du pilote à main et à pied lourds. Plus tard apparait le grand monoplace "Elephant" de la Martinsyde Co., pourvu du moteur Beardmore de 120 h.p. (plus tard 160). Cet appareil se distingua par son travail de bombardement. Et en 1917 la firme Martinsyde produit le fameux "Mother," monté d'un moteur "Falcon" de la firme Rolls-Royce, qui bat le record de la vitesse du monde entier par plusieurs milles à l'heure.

Cette dernière machine s'est à présente développée dans le type "F.4" un modèle pour tout dessinateur qui veut étudier là combinaison dans une seule machine des qualites de main d'œuvre, de résistance, et de vitesse.

Sans être une machine de course, le "F.4" est presque aussi rapide que les avions les plus rapides, et c'est un appareil dans lequel aucun pilote n'hésiterait à entreprendre le tour du monde.

Pourvue de flotteurs, qui en eux-mêmes sont une innovation dans le domaine de l'aviation, cette machine a une égale valeur comme hydravion et comme aéroplane.

Le Premiers Avions Multi-Moteurs.

Il est probable que c'est dans la production des avions multi-moteurs, que les dessinateurs britanniques sont le plus en avance sur les dessinateurs des autres pays. Il est presque certain que les premièrs avions bi-moteurs du monde ont été les appareils construits par Short

Brothers pour le ministère de la marine en 1912-1913. Et probablement le premier appareil bi-moteur employé pendant la guerre a été le "Caudron."

Mais il est certain que le premier dessin moderne de ce genre a été dessiné par Flight-Commander Dyott avant la guerre, et construit (après une longue et forte opposition des authorités) par la firm Hewlett et Blondeau en 1915-16. Peut être considéré comme le contemporaire de cet appareil, le bi-moteur dessiné et construit par C. R. Fairey. Ces deux machines achevèrent des vols d'expérimentation très bons, mais des "experts" techniques se refusèrent à les accepter, ces experts n'étant pas encore initiés aux possibilités de ces nouvelles engins de guerre.

Les Premiers Appareils de Bombardement et de Transport de Passagers.

C'est grâce a l'éloquence persuasive et aux arguments décisifs de Frederick Handley Page qu'un département technique des plus obstinés et obstructifs permit enfin la construction d'un avion bi-moteur qui pouvait réellement voler. L'importance du résultat obtenu par H.-P. se mesure le mieux lorsqu'on se rend compte que le succès du H.-P. entraina l'annulation de certains dessins officiels très beau sur papier mais qui n'auraient jamais pu voler, bien que, alimentés par une force motrice suffisante, ces appareils auraient pu se trainer dans les airs par la force brutale et l'ignorance.

Depuis l'apparition du H.-P. à deux moteurs Rolls-Royce jusju'qu'a la dernière creation H.-P. qui fit la traversée de Londres a à Paris en 2 heures et 10 minutes avec 2 moteurs Napier de 450 h.p. chacun, le record de la Handley Page, Ltd., fut un grand succès. Sans faire mention de son excellent travail pendant la guerre, une des débutantes bi-moteurs fut la première machine qui emporta 20 passagers dans un seule vol. Plus tard, une des machines à 4 moteurs fut la première a emporter 50 passagers du coup.

Comme appareil à lever de poids et à traverser de grande distance, la H.-P. a été vraiment remarquable. Cette firme place à son actif le premier voyage de Londres à Constantinople, de Londres en Egypte, et le premier voyage de Londres aux Indes. Ce n'est que grâce a l'armistice que le voyage de Londres à Berlin ne se fit pas. Il se peut que la nouvelle appareil à moteurs Napier pourra faire pendant la paix ce que son prédecesseur ne put réaliser pendant la guerre.

La Premiere Ligne Belge de Traffic.

Au crédit des avions Handley Page ce place aussi un beau record de vols en temps de paix depuis que l'aviation internationale est de nouveau permise.

Les services H.-P. entre Londres et Paris et entre Londres et Bruxelles ont fonctionné avec une régularité et un succès remarquables. En transportant des effets d'habillements aux Belges privés de tout, les H.-P. ont accompli à la fois un travail humanitaire et profitable.

The Avro "Baby" Biplane (35-h.p. Green engine), fitted with floats.

Nous tenons à rappeler que le fondateur de la firme, F. Handley Page s'est occupé lui-même de dessins d'avions depuis 1908. En 1909 il commença à développer l'idée des machines stables, et il continua à étudier cette question et à construire des machines d'expérimentation jusqu'au moment où le commencement de la guerre prouva que la pratique est plus importante que la théorie.

La Premiere Avion de Terre Patrouiller les Mers.

Un autre pionier de l'aviation qui a remporté des grands succès avec les bi-moteurs est Robert Blackburn de Leeds, qui également commença ses expériences en 1908. Avant la guerre le monoplan Blackburn était deja très bien connu. Au début de la guerre la firme s'occupa de construire des avions d'après des dessins officiels, mais bientôt le génie du fondateur de la firme se consacra aux dessins personnels et il en résulta le Blackburn "Kangaroo" à deux moteurs "Falcon" de la firme Rolls-Royce. Au début cette appareil devait être employé comme hydravion à flotteurs, mais presqu'instantanément elle fut convertie en avion a roues.

Maigré ce qui précéde l'appareil fut longtemps employé pour faire de longues patrouilles sur la mer du Nord, et à son avantage nous disons que cette avion a patrouillé les mers plus longtemps que tout autre machine de terre. L'appareil est facile a diriger de sorte que son pilote ne se fatigue pas vite.

Depuis la paix cette appareil fut exposée au Salon de la E.L.T.A. à Amsterdam. C'est là, que les deux "Kangaroos" prirent à bord le plus grand nombre de passagers dans le temps le plus court de toutes les autres machines, et les deux appareils rentrèrent en Angleterre sans nécessiter de raccommodages et ayant réalisé un joli petit benefice.

Les Premiers Aeroplanes Stables.

Dans un sens tout à fait différent, nous voyons un grand succés pour deux autres pioniers de l'aviation. En 1909 G. Holt Thomas, enthusiasmé par l'aviation qu'il avait fait en France, décida Louis Paulhan à venir démontrer en Angleterre. En 1910 il organisa le vol de Louis Paulhan qui remporta le prix pour le premier voyage aérien de Londres à Manchester. En 1911 il établit le Aircraft Manufacturing Co., Ltd., et commença la construction d'avions Farman. Plus tard il s'adjoignit Peter Hooker, Ltd., de Walthamstow, et commença la construction des moteurs Gnôme et Le Rhône.

En 1913 Geoffrey de Havilland, un ingénieur très doué se joint

Three-quarter Front View of the Martinsyde F.6 (300-h.p. Hispano-Suiza engine).

à lui. Ce dernier avait construit et piloté son appareil et son moteur à lui en 1909, et avait été nommé depuis dessinateur en chef du Royal Aircraft Factory où il produisit en tout premier lieu un biplan à hélice tractive en 1912, et un peu plus tard le fameux B.E.2c, le premier avion stable, en même temps qu'un appareil de vol de première qualité.

Les Premiers Avions de Bombardement en Plein Jour.

Le résultant de la combinaison fut la série des appareils "D. H." construits par le "Aircraft Mfg. Co., Ltd.," d'aprés les dessins de Geoffrey de Havilland.

Pendant la guerre le "D.H.2," à moteur Gnôme de 100 h.p., se distingua comme l'appareil de combat monoplace la plus efficace. Le "D.H.4," d'abord pourvu de moteurs Rolls-Royce, était le plus rapide des avions de bombardement à long relais de son époque.

Le "D.H.9" à moteurs "B.H.P.," et plus tard comme le "D.H.9a," à moteurs Liberty, se range parmi les avions de bombardement en plein jour encore plus rapides. Et à la fin de la guerre le "D.H.10," à moteurs Liberty, allait prendre service comme la plus rapide des avions à bi-moteurs de ce genre.

La Premiere Ligne Aarienne Londres-Paris.

Depuis la guerre les appareils "Airco," travaillées par la firme alliée "Air Transport and Travel, Ltd.," sous la direction du Général Festing, ont accompli le haut fait d'exploiter avec succès la voie des airs la plus importante du monde entier, sous les conditions géographiques et météorologiques les plus adverses. Malgré les brouillards et les tempêtes de la Manche et malgré le climat changeant de l'Angleterre, le service Airco a couvert plus de 50,000 miles entre Londres et Paris sans perdre ni un seul passager, ni un colis, ni un courrier. Leurs machines et leurs pilotes ont fait plusieurs voyages alors que le bulletin officiel marquait les conditions atmosphériques nefastes à l'aviation. Le pourcentage des jours auxquels il leur a été impossible de faire la traversée est extraordinairement minime.

C'est à la firme Airco que revient le crédit d'avoir prouvé d'une façon absolue que le transport par voie d'air appartient maintenant à la liste des propositions commerciales.

Le Premier Veritable Appareil de Combat.

Un autre grand succès dans l'aviation appartient également à une firme britannique. Vickers, Ltd., fut la première grande firme d'armement qui ouvrit un département à l'aviation, grâce a l'énergie de feu le Major H. F. Wood. Avant la guerre beaucoup de ceux qui se rangent maintenant comme chefs de notre service d'aviation, firent leur apprentissage sur des machines de Vickers, Ltd.

Au début de la guerre le seule avion de combat convenable était le biplan Vickers, à moteur Gnôme de 100 h.p., le résultat des efforts combinés de feu Harold Barnwell et G. H. Challenger. Pendant la guerre les usines Vickers construisirent d'énormes quantités de machines de différents types et en 1918 le fameux biplan "Vimy" fit son apparition, trop tard cependant pour prendre du service actif. Après l'armistice cette avion fut developpée en appareil civile par son dessinateur R. K. Pierson, et nous avons ainsi l'excellente aeroplane "Vimy."

La Premiere Traversee Transatlantique Directe, et le Premier Voyage aux Antipodees.

Avec une splendide initiative la firme Vickers entreprit la question de la traversée de l'Atlantique. L'organisation de cette entreprise fut dignement confiée au Capitaine P. D. Acland qui prit charge du département de l'aviation après la mort du Major Wood.

La traversée de l'Atlantique en un vol ininterrompu fut accompli avec un avion Vimy à deux moteurs Eagle de la firme Rolls-Royce, par le Capitaine John Alcock accompagné du Lieutenant A. Whitten Brown comme passager.

Et maintenant s'annonce l'arrivée en Australie de l'avion Vimy, encore à deux moteur Rolls-Royce, piloté par le Capitaine Ross Smith, avec comme passagers son frère Keith Smith et les sergents Bennett et Shiers. Vraiment un triomphe pour la maison Vickers.

La Premiere Revindication de l'Industrie.

De ce qui précède il est évident que les grands résultats obtenus en aviation, soit en temps de guerre, soit en temps de paix, appartiennent en grand partie aux pioniers britanniques.

Il sera avantageux a tous ceux qui ont l'intention d'equipper des services aériens militants, ou des services postaux, ou simplement des services de passagers, de considérer sérieusement les mérites des firmes britanniques avant de s'aventurer dans l'achat d'avions en grandes quantités.

Il n'est pas moins intéressant de noter que dans l'aviation en temps de paix les firmes britanniques ouvrent également la voie. Le fait que rapportait une publication officielle qu'aucun appareil spécial n'avait été construite pour l'aviation civile est décidément incorrect.

Les Premiers Avions Commerciaux.

Il semble donc utile de rappeler que le premier avion commercial du monde, dessiné a cet effet, a été produit au début de cette année par Mr. Frederick Koolhoven, de la British Aerial Transport Co., une firme créée pendant la guerre. Cette appareil officiellement dénommée "F.K.26," mais généralement connue sous le nom "Big Bat," est reconnue non seulement comme étant la première aéroplane commerciale, mais aussi comme étant un des meilleurs avions en tant que dessin et construction. Pourvu d'un moteur "Eagle" (Rolls-Royce) cet avion possède la vitesse d'une machine de guerre et se manie à la perfection.

Cet avion est un digne successeur du "Bantam" produit en 1917 avec un moteur "Wasp" de l'A.B.C. et qui fut rejetté par les "experts" du Ministère de l'Aviation, bien qu'à cette epoque cet avion était le meilleur monoplace de combat. En 1918 La "Basilisque" avec son moteur "Dragonfly" de 350 h.p. (A.B.C.) était egalement refusée, bien que plus rapide que toutes les autres avions de l'époque.

Il y peu de dessinateurs d'avions qui soient aussi versés dans la question que l'est F. K. Koolhoven.

Une autre appareil purement commerciale est la Westland "Limousine," produite par M. A. Bruce, précédemment un collaborateur dans la production de la torpille Brennan et le Brennan monorail. La Westland Co. fut formée pendant la guerre par la fameuse firme d'ingénieurs Petter à Yeovil, et leur "Limousine" est digne de leur réputation.

Le Premier Grand Canot-Volant.

La Grande Bretagne a ouvert la route dans une autre branche de l'aviation. Bien que les canots volants aient été organisés par Glenn Curtiss, ils one été perfectionés par feu John Porte, qui mourut avec le grade de Colonel de la R.A.F.

Ses canots-volants de Felixstowe, qui atteignent leur point culminant dans le grand bateau le "Felixstowe Fury" ont guidé le monde dans ce genre de travail.

Il est intéressant de noter que la construction des bateaux volants se continue par S. E. Saunders, Ltd., à Cowes, par la Supermarine Co., à Southampton, et par la Gosport Aviation Co. à Gosport. Short Brothers construisent également des bateaux-volants bien que premièrement ils étaient constructeurs d'hydravions à flotteurs-pontons.

Les Premiers Deserteurs.

Malheureusement beaucoup de grandes firmes qui ont construit de bonnes machines et réalisé d'énormes bénéfices pendant la guerre, se sont retirées de l'industrie de l'aviation. Mais probablement ils ne représentent qu'une petite perte pour l'industrie aéronautique, bien que leur argent eut été utile pour faire des travaux d'experimentation. En compensation d'autres grandes firmes se

FLIGHT WITH ECONOMY

maintiennent dans l'industrie pour continuer les travaux d'expérimentation jusqu'au moment ou l'aviation sera accepté comme proposition commerciale.

Les Premiers Succes dans la Nouvelle Industrie.

Parmi ceux-ci citons la Austin Motor Co., avec son Austin "Whippet"; Boulton & Paul, Ltd., avec leur magnifique bi-moteur "Bourges"; et MM. Beardmore & Co., Ltd., avec plusieurs différents types pour l'expérimentation. Ces maisons ont déja fait preuve de mérite et peuvent se classer avec les pioniers, et le "Nighthawk" de la British Nieuport Co. peut revendiquer une place parmi les avions les plus rapides du monde.

En résumé l'industrie britannique de l'aviation peut se mesurer avec les industries de la France et de l'Allemagne si on la juge d'après les accomplissements de ses produits.

Nous n'avons pas eu l'intention d'établir ici une histoire de l'aviation britannique. Il s'agit simplement d'un bref coup d'oeil dans le domaine de ce qu'ont fait nos avions et leur producteurs.

Nous espérons avoir été clairs et de quelque utilité a nos lecteurs.—C. G. G.

THE LATE JOSÉ WEISS.

Though the name of José Weiss, who died on December 11th, may mean but little to the present generation of aviators, he was, none the less, among those to whom aviation of to-day and of the future owes most, for to him was due very largely, even if indirectly, the development of the uncapsizable aeroplane. Though no aeroplane designed by José Weiss ever flew, in the presently accepted sense of the word, yet he showed many of the successful designers of to-day what it was possible for an aeroplane to do.

José Weiss was born in Alsace, and at an early age he came to England, as his father objected to living under German governance. On reaching man's estate he became a British subject and devoted himself to the profession of painting. He adopted Sussex as his model, and for years he painted that delectable county in all her moods, phases, and manifestations.

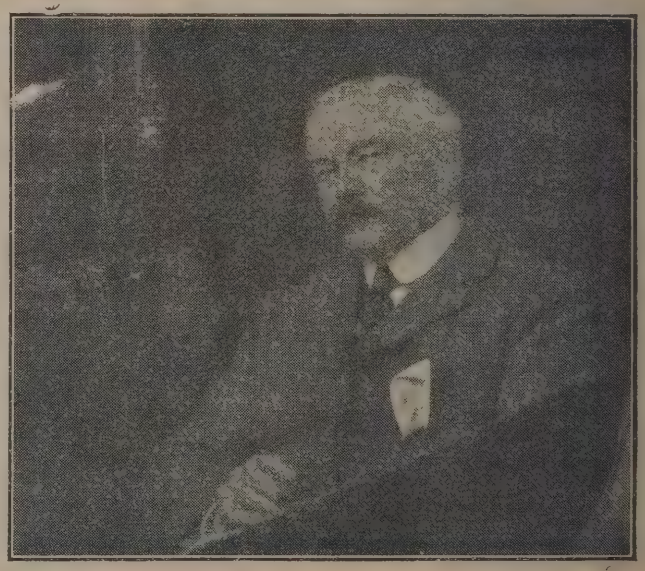
His name as an artist is, perhaps, not very well known to the vulgar many in this country, but his pictures were held in high esteem abroad, especially in America, where he sold the majority of his works. He worked fast and hard, and made money comparatively easily, and whatever money he made beyond his household expenses and his own simple needs he spent on his aeronautical experiments.

One first had the honour of meeting José Weiss early in 1909, when he was experimenting with his gliders at Amberley. At that time he had already achieved considerable success, and had developed the bird-like type of monoplane with which his name was associated.

This machine had a stout, stumpy body, with cantilever wings which were swept backwards and upwards, so that the two wing-tips acted as a tail. The wing-tips were, in fact, the whole control, for there was no rudder or elevator.

By dint of careful experimenting and reasoning Mr. Weiss had arrived at a perfect combination of horizontal and vertical surfaces, so that his machines were absolutely stable: that is to say, they were uncapsizable and self-righting. By warping the wing-tips up or down, the machine could be made to bank and turn to right or left as desired, and by pulling both wing-tips up together the machine could be made to throw its nose up and stall.

With José Weiss in his experiments at Amberley was associated his friend and neighbour Keith, also an artist. Between them they evolved a number of theories concerning the flight of birds, and they applied these theories to their models. Some of those theories have been recorded in print in letters and pamphlets written by José Weiss, and it would be well worth the while of our clever young designers of to-day to study them.



These theories appear to have been particularly right in connection with the design of the fuselages of aeroplanes, and it is a fact that the bodies of the most efficient modern machines approximate in shape to those advocated by José Weiss. Also it is interesting to note that the Weiss wings were of the cantilever type which now seems to be coming into use, especially in Germany.

In 1909 the experiments at Amberley progressed to the stage of building man-carrying gliders. These were piloted by Mr. Gordon England—later to become famous as a pilot, designer, works manager, and consulting engineer—and by Mr. Gerald Leake, a young artist-pupil of José Weiss, who has since done well as an artist in America. Greatly daring, these youths were launched, in these frail structures of linen and bamboo lashed together with waxed thread, from the top of Amberley Mount into the up-current of a wind blowing against the hillside, and on one occasion Mr. England rose to a height of 30 ft or so above the starting-point, landing eventually in the valley nearly a mile away.

The success of these gliding experiments led to the building of a power-driven machine, which did in fact make straight flights on the sands at Littlehampton and at Brooklands. But, owing to an incompetent engine and to lack of knowledge of constructional detail work in the machine itself, it never flew satisfactorily.

Later Mr. Handley Page, then building experimental machines at Barking, interested himself in the Weiss theories and built several machines more or less on Weiss lines. One of these, piloted by the late Edward Petre, was the first aeroplane to fly through London, when it voyaged up the river from Fairlop in Essex to Brooklands. On the same machine and its successor much flying was done at Hendon by the late Wilfred Parke, R.N., and during 1914 a biplane on similar lines was flown by the late Rowland Ding, including a flight to France with a passenger.

Since then it has been found possible to achieve stability by means involving less complicated methods of construction, but the fact remains that the Weiss machines were a distinct step forward in the search for

the uncapsizable aeroplane. It is, however, rather for his research work and for his theories as to the increase of efficiency in aeroplanes by way of body and wing design that José Weiss deserves to be remembered.

Of late years he and his friend Keith have been experimenting with a flapping-wing machine actuated by man-power only. Though nothing has been published about the results achieved, one believes that considerable success attended their efforts. José Weiss himself said that it was actually possible with their experimental machine for a man to lift his weight on the wings with the machine supported on slings between two trees, though they had not ventured to attempt a free flight. It is to be hoped that some record of these experiments will be available in the future.

José Weiss was by nature a philosopher as well as an artist, and it grieved him deeply that the aeroplane, which he regarded as the dove of peace which was to bring one nation into friendly intercourse with another, should first be made manifest rather as the eagle of war. He regarded war as wicked and wasteful, and could never bring himself to think of it as a biological necessity. His kindly and gentle nature abhorred the cruelty of it all, and he hoped that by the education of humanity the world's peoples might be taught to love one another.

At any rate, he had the satisfaction of seeing aerial communication growing into a practical proposition, albeit the machines which fly do so by means which do not accord with his theories. If the world held many people like José Weiss, this aerial communication of which we are all so proud would go far to produce universal peace. Unhappily there are few like him, and the world is the poorer for his loss.—C. G. G.

SIR JOHN ALCOCK, K.B.E.—1892—1919.

On Thursday afternoon, December 18th, 1919, Sir John Alcock died in hospital at Rouen as a result of an aeroplane accident at Côte d'Evrard, about 25 miles from Rouen. He had left England in the morning on a Vickers "Viking" biplane which was so designed as to be capable of alighting either on land or on water. He intended to fly to Paris and to alight on the Seine opposite the Grand Palais.

It is difficult, in the absence of detail, to judge the reason for the accident, but eye-witnesses state that at about one o'clock on December 19th they saw a large aeroplane approach in a very high wind. It became unsteady—in the eye-witnesses' view—and finally crashed to earth. The pilot, Sir John Alcock, was found in the wreckage, unconscious, with serious injuries to the head. He was removed to Rouen, was operated on without delay, but died without regaining consciousness at 4.30 p.m. on the same day.

There is always regret at the death of the great and the robbing of the earth of another of those spirits which illumine its progress, but there is peculiar sorrow at the loss of Sir John Alcock. Modest, unassuming, and quietly efficient, he had few, if any, enemies, and his general popularity was unquestioned.

Born of no distinguished line, supported by none of the extraneous advantages that come from wealth or worldly position, he earned the gilded spur by a successful endeavour that gave him a true place in the knightly succession which has kept chivalry alive throughout the centuries. None of those who have sought the great adventure in the past would hesitate to acknowledge him as of their class. Those who knew him best liked him the most, and that is the finest praise for any man.

The son of Mr. John Alcock, of Kingswood Road, Fallowfield, Manchester, he was born in that town in 1892. Eighteen years later he was apprenticed to the Empress Motor Works. A little later, if my memory is accurate, he became connected with the Sunbeam Company. In any case he was flying a Maurice Farman biplane, fitted with one of the earliest Sunbeam aeroplane engines, in 1911-12, taking his aviator's certificate—No. 368—on November 26th, 1912, at Brooklands.

At the outbreak of war he joined the R.N.A.S. and was posted to Eastchurch as an instructor. He was later made chief instructor to the "Acrobatic" Squadron—a curious inversion of his usual practice in life. After repeated efforts he succeeded in being posted to an active service unit. He was appointed flight commander at Mudros in 1917, and on September 30th in that year he was awarded the D.S.C. for gallantry in attacking three enemy seaplanes off Lemnos. In the long-distance bombing raids which gave distinction to the aviators at Mudros he took an active part until towards the end of the year he was brought down off Suvla by engine failure. Swimming ashore with his crew, he hid in the rocks for some hours, only to be captured in the end. All three were kept prisoners in Turkey until the beginning of the Armistice. He was then released.

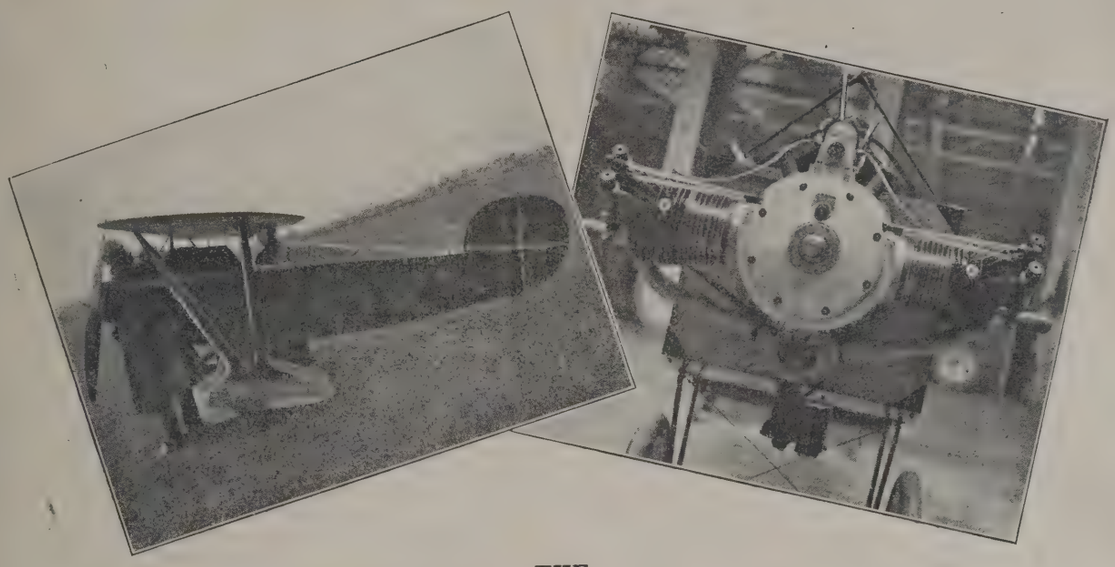
On his return home he accepted an appointment with Vickers, Ltd., and early in the present year he left for Newfoundland with a Vickers "Vimy" biplane. All the world knows the story of his Atlantic flight with Mr. A. Whitten Brown, R.A.F., on June 14th-15th.

His Majesty the King, in appropriate recognition of the spirit of their endeavour, appointed them both to be Knight Commanders of the Order of the British Empire.

Since that time he continued in his work for Vickers, Ltd., unspoilt by his great success, and, as ever, entirely averse to any manner of unnecessary advertisement.

The sympathy of the world will be with his mother in her great loss. Her consolation may be found in the recollection of his achievements in the past, and that the death he would have chosen came to him in the end.

This entirely insufficient memoir will be supplemented next week by a further notice by one who knew him and liked him well.—W. E. DE B. W.



THE LATE SIR JOHN ALCOCK, K.B.E.

The "Bristol" Aeroplanes

STAND 65

International Aircraft Exhibition — Paris.

THE

"BRISTOL" BABE

Quality — Efficiency — Economy.

Highly efficient and extremely economical, this aeroplane can easily be handled by one man, and can be housed in an ordinary garage. It is a sturdy construction, the fuselage being of three-ply wood throughout without bracing wires. Fitted with a 40 h.p. two-cylinder air-cooled Siddeley engine, a speed of 85 m.p.h. can be obtained, and the petrol consumption is only 3 gallons per hour. The Anzani engine can also be fitted if desired. The main specifications are:—

Weight empty.		460 *lbs.*	*Wing Area.*	107.8 *sq ft.*
Weight loaded.		683 *lbs.*	*Wing Loading.*	6.34 *lbs. per sq. ft.*
Wing Span	*Top Wing,*	19 *ft* 8 *ins.*	*Overall Length.*	14 *ft.* 11 *ins.*
	Bottom Wing	18 *ft* 8 *ins.*	*Maximum Height.*	5 *ft.* 9 *ins.*
Chord of Wing	*Top Wing*	3 *ft.* 11 *ins.*	*Petrol Capacity.*	6.5 *gals.*
	Bottom Wing,	2 *ft.* 6 *ins.*	*Landing Speed.*	40 *m.p.h.*

THE NAVAL ESTIMATES.

The Navy Estimates for the year 1919-1920 were presented to Parliament by command of His Majesty late in the past week. There is naturally little reference to aeronautics in the votes as the Admiralty has at present no responsibility in aerial matters. In Vote 9 there appears an allocation for "Aviation" of £978,100 less an appropriation in aid of £70,000. This vote covers salaries, wages, matériel, etc., in "aviation establishments," but a footnote shows clearly that these sums relate to the construction and maintenance of the airships which have now been handed over to the Air Ministry. Therefore no object will be served by an attempted analysis of the expenditure.

The First Lord's Statement.

The First Lord of the Admiralty made his statement in the House of Commons on Dec. 10th, 1919. Towards the end of his speech he referred to the influence of aviation on the employment of big ships.

The Board of Admiralty are just as well aware of the fact as anybody else that we have immense possibilities before us. Who can say what is going to be the development of the Air Service in the future, and what is to be the effect of the Air Service? I was told to-day that the Air Service is going to be so effective that it will destroy the battleship, which is such a big target. That is the view of one side. I go to a great airman and I say, "I am told that our big battleships are not going to be of any use, because they offer such big targets for bombs which are heaven knows how many tons in weight, and which are to be dropped from the clouds onto the battleships." He said, "Some people will tell you that, but, speaking for the air people, I can say that as fast as they develop that attack we are developing a counter-attack and defence, and we shall have something to say before you abandon your big ship simply because an airship has been devised that is going to threaten you with bombs." There are the two sides to the question. I am taking neither side. We have to-day in His Majesty's Navy some of the most magnificent ships the world has ever seen, wonderful productions, and to destroy these vessels because we are told that the air is going to replace the Navy would be a criminal thing for any Board of Admiralty to do.

He then states that scientific investigation is proceeding and that the powers of aircraft and of the submarine will be gauged from time to time. There we may safely leave the official view for the present. It is not wise to destroy the existing form of a service until the future course of action is clear. Reduce programmes if you will, but that is sufficient. Nothing in the war has proved that the aeroplane can eliminate battleships.

The Debate.

Mr. Lambert opened the Debate and speedily came into collision with the Chairman of Committees as to the propriety of discussing the Air Ministry when the House was in Committee over the Navy Estimates.

The policy of the existence of the Air Ministry could not be dealt with in this Committee as it was a matter requiring legislation.

Mr. Lambert doubted whether or not the great surface ships of the present, such as the "Hood," costing, as it did, £6,000,000, had any future value in view of the possibilities of aircraft and submarines.

He then discussed the position of the great dockyards from a strategical point of view, but without any special reference to aircraft.

The Debate was continued by Rear-Admiral Adair, who has always held pronounced views as to the use of aircraft in naval war, and, in one's own opinion, views which are essentially sound, based, as they are, on strategic principles and the knowledge of psychology, which is the foundation of all good staff work.

Rear-Admiral ADAIR: I say that the Admiralty have been negligent in respect to the Air Force associated with the Navy. I will put it that way to avoid any question of policy.

In my opinion, any personnel working with the Navy as part of an Air Force must primarily be seamen. Aviation is only a means to an end, and that end in the case of an Air Service attached to the Navy is maritime warfare. The efficiency of the Navy, I say, is bound up intimately with its Air Service, and perhaps it would be well if I just mentioned to the Committee what the actual duties are of an Air Force serving with the Navy. They are embarked in ships called carriers, such as the "Argus," which carry aircraft to operate at distances beyond the reach of those which lie at shore bases. Such ships carrying these aircraft can accompany the Fleet, and the aircraft may be sent out as scouts for the Fleet, or they may actually take part in a Fleet action, when it occurs, by the use of bombs or aerial torpedoes, or they may be used with the same weapons against enemy fleets in their own harbours. They are embarked in fighting-ships, battleships, and the larger cruisers, as aids to efficient gunnery. There is the spotter, flying in a small machine, watching the fall of the shot, and there is the fighter, flying in another small machine, who has to protect the spotter from the enemy. The long-range fire of the Navy is absolutely bound up with this service of spotting and the protection of the spotter. They are employed at shore bases—coastal areas, I believe the correct term is—from which they defend the coastal waters against submarines and mines of the enemy, or they can be used from these bases for reconnoitring such distance as is feasible within their range of action, or they can be employed, again, with bombs or with Whitehead torpedoes, to attack enemy ships. In short, their duties are all forms of maritime warfare that can be effective from the air. That sounds rather paradoxical, but that is the actual fact.

Every one of these duties is linked absolutely with the Navy, and they are purely naval matters. They must be under the command and direction of naval officers. The information, for example, which a Commander-in-Chief requires as to the composition, the disposition, the course, and the speed of a Fleet, which has to be brought in, perhaps, by one of these scouts—I ask the House to consider, could any man but a man who has been educated in Fleets bring back intelligible intelligence to that Commander-in-Chief? If they are not properly educated in Fleets prior to their becoming aviators, then they may bring misleading and absolutely dangerous information to their Commander-in-Chief. In my opinion, there can be no question whatever about it that the Naval Air Service must be formed of men who are part and parcel of the Navy, and no amateurs can effectively do the work. Herein lies the first blunder, if I may call it so, of the Admiralty. They started the Royal Naval Air Service as a separate Service, and on no account should they have dissociated the administration of that Service from the Navy itself; it should have been a part of it, and when they allowed the whole of this Service to be turned over to the Air Ministry they made a still greater blunder, because they were turning it over to people who did not appreciate the needs and duties of the Navy, and it was highly probable, therefore, that any progress in naval aviation would not be what it should have been.

Let us see for a moment why they turned this Royal Naval Air Service over to the Air Ministry. At the outset of the war aircraft could be numbered, perhaps, by dozens. There were very few firms, and those only small ones, in the country who could produce them. Practically speaking, there were no fighting machines, and the manufacture of these fighting machines had to be done very hurriedly. There was great competition and rivalry between the two Services, and of course friction ensued. Neither party knowing exactly what they wanted, there were constant changes, and each party, the Army or the Navy, was demanding to be served first, and each wanted its own latest invention. All that occurred and led to the amalgamation of the two Forces, the Royal Naval Air Service and the Royal Flying Corps, under an Air Minister. I am not criticising that, but only stating facts. I do not wish to touch on policy, but I say that in future no such difficulties as those will occur. There need be no clash of interests whatever, for the productive capacity of the country now is quite sufficient to meet every service, however distinct it may be. I speak as a manufacturer, and the firm with which I am connected has made every sort of aircraft and engine under the sun. I wish to impress on this Committee that the true lesson learned as regards air service during the war was this—that the duties of the Naval Air Service were very different from those of the land Air Service, required different material, different administration, and a different education for its personnel. What has happened? In a letter that he addressed to the "Times" the other day, the late Under-Secretary for the Air said, "As a consequence of the amalgamation of the Naval and Military Air Force, the Air Force increased to an astonishing degree on the military side." That is all I wish to read, but I wish to supplement that statement, and my supplement is this, that I say emphatically that the amalgamation had a most prejudicial effect.

I will mention a few facts indicating the lack of progress in the Naval Air Service. The first is that no aeroplane specially adapted as part of the equipment of a battleship for this spotting, and the fighting machine accompanying the spotter, has even yet been designed. What has been used has been a makeshift arrangement. Certain obsolete forms of land service aircraft have, I believe, been employed with certain air-bags attached to them for the purpose of alighting on water. A proper machine is absolutely essential and should have been produced long ago. The second item I wish to refer to is this, that little or nothing has been done towards producing an armour-piercing bomb. An armour-piercing bomb is absolutely essential for the attacking of a ship that has a protective armoured deck. In not seeing that such a bomb has been produced the Admiralty have been neglectful. The third item that I refer to is that there is no such thing existing as a really reliable and accurate sight. It stands to reason that when you are aiming on a submarine from 5,000 ft. or 10,000 ft. in the air you must have a very accurate sight, and, owing to the movement of the machine, it is necessary to have some such thing as a gyroscopically controlled one. Two years ago such a sight was nearing perfection, and yet the Navy has not got it yet. The fourth item in which failure to make progress has occurred is this. Some five years ago there was actually fired from a naval aeroplane, or it might have been a seaplane, a Whitehead torpedo—successfully discharged from a craft in the air; but only this year, five years later, an attack has been carried out by such a craft with such a torpedo on a fleet with success. I say that if the Admiralty had been doing their duty they would have had all these items completed long ago; and I would go so far as to say this, that, had the progress of the Naval Air Service been left in the hands of the Navy, the German fleet might have been destroyed in Wilhelmshaven long before the Armistice. That is rather a severe charge to make, but I think it is one that is justifiable.

These views coincide with those expounded by the Editor of this sheet in that "root and branch" manner which is as prolific in the production of friends as of enemies. He has emphasised the necessity of naval aircraft being manned by naval officers of experience and he has, with unpleasant accuracy, described the negligence of the Admiralty in matters closely concerning the Royal Naval Air Service. There is no need for further comment than to express complete agreement with Admiral Adair.

Major-General Seely, released from the cares of office, spoke in his usual manner, and said once again those things which he has so often reiterated before. After his customary defence of the separate Air Force principle he stated an imaginary case as follows. Should the First Lord desire additional aircraft he must address his "appeals to the right hon. gentleman the Member for Dundee (Mr. Churchill), and the right hon. gentleman the Member for Dundee says, "I am not in a position to give you these things which you so vitally require for the safety of the Fleet and its efficient conduct." "Why?" asks the right hon. gentleman. "Because I consider they are required for the Army," is the reply. "And why do you so consider?" "Because I interviewed myself five minutes ago, and so I decided." That is really opera bouffe; it is not Government."

Major-General Seely's style is well known. It is a mass of superlatives plausibly arranged but based on little that is solid. In his speech all he has succeeded in saying is that he does not approve of any proposal to abolish the Air Ministry, and that it is absurd to place the War Office and Air Ministry under the same Statesman.

He was followed by Viscount Curzon, who, always devoted to the Navy, and prevented joining that Service in early youth owing to ill-health, served with distinction in the "Queen Elizabeth" during nearly the entire war.

Viscount CURZON: . . . The Air Services are what I would next deal with. I feel some considerable difficulty in alluding to this matter at all, but I should like to say this much, that I do know there is a great deal of anxiety about it on the part of the Navy. I have had the opportunity of getting to know something about the matter, and it has been put to me that it is obviously very difficult for the Commander-in-Chief of the Grand Fleet to have to communicate at one and the same time with both the Admiralty and the Air Ministry upon various subjects connected, say, with the aviation services of the Atlantic Fleet. I suggest to the right hon. gentleman that this is rather a difficult situation, and one which does not entirely make for efficiency.

Major-General Sir John Davidson, who was Director of Operations under Lord Haig in France, spoke later on the necessity for the creation of a Joint Imperial General Staff in order to co-ordinate the work of the War Office, Air Ministry and Admiralty.

Captain H. W. Benn was the next to make any reference to aerial matters. He said:—

. . . . My view, and I am sure it is the view which naval officers hold, is that the aerial arm has been as much a part of the Navy as the submarine, that there is a portion of the Air Service as regards the Navy which is analogous to the submarine service, and that it should be manned by men with naval experience, who would do their time in the air work, and when they are too old to fly would revert to the Navy in the same manner that the submarine officers revert to the Service ship. These men would be of inestimable value to the Service, having had air training and experience in flying. There is another view of the subject, and that is that the Admiralty have produced the submarine service, a child of their own, and encouraged it in every way, and it has benefited by the traditions of the Naval Service. In a similar way, if the Navy were responsible for their particular section of the Air Service, that section would have the naval training and the naval experience which is necessary for sea warfare. I do not want it to be understood that I am suggesting the abolition of the Air Ministry, or any reduction or supplanting of the Independent Air Service. That has been laid down as a policy of this House, and is not one which is open to question. I do not think that anybody either in the Army or the Navy would suggest that there should not be an independent Air Service. It is only that there are certain branches of the Service which, in my opinion, should be manned by naval men.

Lieut-Commander Kenworthy referred briefly to the relinquishment of airship building in this country, but he was more troubled by the number of motor cars in the Navy.

In the course of a general reply, Dr. Macnamara, Parliamentary Secretary to the Board of Admiralty, said:—

. . . As regards the interesting comments of my hon. and gallant friend the Member for the Shettleston Division (Rear-Admiral Adair), my right hon. friend the Member for South Molton (Mr. Lambert), my right hon. and gallant friend the Member for Ilkeston (Major-General Seely), and my hon. and gallant friend the Member for Greenwich (Captain Hamilton Benn), in regard to the question of the relations between the Navy of the future and operations in the air, that, obviously, is a matter of high policy. It is a question for the Board of Admiralty in the first instance, and then for the Cabinet. If I do not discuss that now, my hon. and right hon. friends will see that it is a matter for a higher authority than I possess, but that, again, will be a matter which, as I have said, will be referred to those responsible for its consideration.

At the end of the general discussion there was a further intervention by Major-General Seely to which the First Lord replied.

Mr. LONG: I have no hesitation whatever in answering my right hon. friend's question, as far as it is possible for me to do so, although I might take refuge, if I chose, in the very ordinary Parliamentary reply that the whole of his question is hypothetical, because really it centres in his conclusion, what course shall I take as First Lord of the Admiralty if and when I find that the present arrangement does not conduce to the efficiency of the Navy? My right hon. friend and I are too old friends to quarrel, but if I wanted to quarrel I might say he must leave it to me to say what course I take when I do not feel it consistent with my honour and credit to remain a member of the Government. That is really the answer to his question. When he asks me about the present situation, that is a totally different question, and, as we have discovered to-night, it is extraordinarily difficult, if not impossible, to answer it within the very narrow limits which we are allowed in this Debate, owing to the fact that we have to accept the existing condition of things under which the Air Board is a Ministry by itself. My right hon. friend is an enthusiastic supporter of a separate air administration. My hon. and gallant friend (Rear-Admiral Adair) does not share my right hon. friend's views. He does not approve of the existing state of things, but he still more disapproves of a separate Air Ministry, and wants a reversion to the original condition which existed before the Air Minister was appointed.

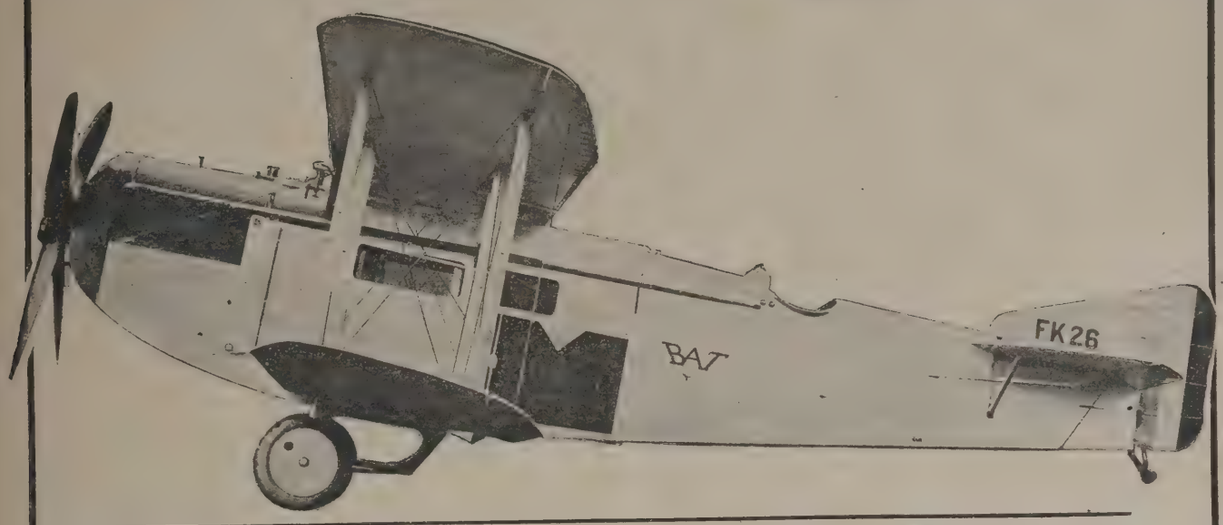
Before the Air Board was appointed the Board of Admiralty and the War Office were each responsible for their respective air branches. Owing to the very unsatisfactory state of things which arose during the war public opinion became very excited, and the opinion of this House was not only unanimous, it was more than that. No Government could have resisted the pressure of Parliament to get rid of this dual control, by the two military Departments, and to substitute a separate Air Ministry. Therefore, it would be kicking against the pricks to attempt, even if you believe in the old system, to go back to it now. Parliament deliberately arrived at this conclusion. I was a member of the Government at the time, and I know how great the pressure was. The Air Department was created, and up to the constitution of the present Government it was under a separate head. The Air Department is now under a Secretary of State, who is also Secretary of State for War. My right hon. friend (General Seely) thereupon rehearses to the Committee an imaginary conversation between myself and the head of the Air Board. I was unable to recognise either myself or the head of the Air Board in the conversation which was rehearsed with artistic skill. He asks me, "What are you going to do when the Secretary of State for War and the Secretary of State for Air, Mr. Jekyll and Mr. Hyde, this dual political personality, tells you that, having discussed the matter with himself, he cannot give you at the Admiralty what you want for the air, because he has already given it to himself at the War Office?" I do not want to take refuge in the hypothetical, but I think I may pray for mercy and say that we have plenty of other difficulties to deal with. We have had a most interesting debate. Everybody who has spoken has criticised the Admiralty and the First Lord, and has attacked us and abused us. [HON. MEMBERS: "No!"] Well, at any rate, the majority have. Ninety-eight per cent. have, and the other 2 per cent. that have praised us have done it more in the sense of favours to come than of favours received. At the end of the debate, with my bruised ribs, and in my exhausted condition, I find myself being asked what I shall do in a hypothetical situation, when the Secretary of State for War says that he has consulted the Secretary of State for Air, and the Secretary of State for Air cannot give to the Secretary of State for War all that he wants, and therefore the Secretary of State for War cannot give the First Lord of the Admiralty all that he wants. That state of things has not yet arisen. As a matter of fact, the chief of the naval staff, who is the First Sea Lord, and the chief of the air staff have been in constant communication. I do not say for a moment that I am satisfied with what the Air Board has done, but I have no reason to believe that this is because the Air Board has surrendered itself to the War Office. I am not at all sure that it is not the case that the Air Board take a different view of what we want than we take ourselves. It may be that my combat in the future will not be with the Secretary of State for War, but with the Air Board, who may take a different view from what we take of naval requirements. All I can say is that when the moment arrives when I find—if I am still First Lord of the Admiralty—that the Navy suffers, the first thing I shall have to do will be to discover whether the culprit is the Air Board or the War Office, and the second thing will be to decide, having found the culprit, the course to take in regard to my own position. I do not think I ought to be asked to state in advance what course I should take. My right hon. and gallant friend has taken his own course. He has, in accordance with a long and honourable Parliamentary position, resigned the office he held because he felt that he could no longer serve the country in that capacity. He may rest assured that I am not likely to hold my office one moment longer than I feel I can hold it consistent with my duty to my country.

THE AIR ESTIMATES.

The "Air Estimates of Effective and Non Effective Services for the Year 1919-1920" were debated in Committee by the House of Commons on Dec. 15th and 16th. As in this year analysis of the Air Estimates would be useless in view of the rapid changes brought about by demobilisation the following abstract is published for information:—

ABSTRACT OF AIR ESTIMATES, 1919-20.

Pp.	Votes. Nos.		Total Numbers
		I.—NUMBERS:	
3	A	Total Number of Officers and Men on the Establishment of the Royal Air Force, exclusive of those serving in India	(a)150,000



Pp.	Votes. Nos.	II.—EFFECTIVE SERVICES	Gross Estimate £	Appropriations in aid £	Net Estimate £
5	1	Pay, etc., of the Air Force	21,501,000	450,000	21,051,000
8	2	Quartering, Stores (except Technical), Supplies Animals and Transport	6,712,000	609,000	6,103,000
10	3	Technical and Warlike Stores	19,867,850	545,000	19,322,850
12	4	Works, Buildings and Lands	6,801,000	399,000	6,402,000
15	5	Air Ministry	692,100	100	692,000
22	6	Miscellaneous Effective Services	204,000	1,000	203,000
		Total Effective Services	55,777,950	2,004,100	53,773,850

Pp.	Votes. Nos.	III.—NON-EFFECTIVE SERVICES.			
24	7	Half Pay, Pensions, and other Non-Effective Services	258,000	1,000	257,000
		Total Effective and Non Effective Services	56,035,950	2,005,100	54,030,850

(a) Number voted by the House of Commons on March 14th, 1919.

It is noted on page 3 of the Estimates that the maximum number of all ranks serving at home and abroad (excluding those in India) is 150,000. This number will be reduced by March 31st, 1920, to 35,000.

The debate was opened by Major-General Seely, who, with a note of bitterness, usually absent from his somewhat rococo speeches, enlarged again on his favourite theme of the sin done to good government by the linking of the Air Ministry and War Office under one Secretary of State. It seemed to listeners as he proceeded that his anger was directed more at the personality of the combined Secretary of State than at the abstract principle, though the latter literally formed the excuse. He appealed to the Committee to support his view that no one man, however hardworking he might be, could give adequate time to both Ministries. His second point was "that it is grossly unfair to the Admiralty," reiterating the arguments used by him in his speech on the

THE IDEAL COMMERCIAL AEROPLANE

The machine here illustrated is the B.A.T—F.K.26—universally acknowledged to be the most practical and efficient commercial aeroplane yet produced. Although a relatively small machine—only 34 feet in over-all length—it possesses surprisingly commodious cabin and cargo accommodation. Four passengers can be carried comfortably, with ample room for personal luggage, or, alternatively, parcels or mails to the extent of 1,000 lbs. in weight and *150 cubic feet in capacity.*

Here are some additional interesting points concerning the machine :—

ENGINE :— 375 *Rolls - Royce Eagle VIII.*

SPEED :—45-120 *m.p.h.*

CABIN :—*Is clear of any transverse cross bracings or other obstruction, and measures 8 ft. by 3 ft. 3 ins. by 6 ft.—his in a machine of 34 feet over-all length. Direct entry off ground through ordinary door.*

LOAD :—*With 600 mile range of fuel*— 1,000 *lbs.*

FUEL COST AT FULL LOAD: —*7.2 pence per mile.*

CHASSIS :—*A sturdy job, sprung by an unique combination of oleo and rubber shock absorbers.*

TAIL : - *Can be trimmed in flight from pilot's seat—steerable and practically unbreakable tail skid.*

GENERAL CONSTRUCTION : —*Straightforward — simple to repair and recondition.*

An impression of the interior of the cabin of the F.K.26.

The B.A.T. F.K.26 as a commercial machine has so many natural advantages, and is so moderate in first cost, that it is really *the ideal machine* to employ in inaugurating air transport services.

A demonstration flight can be arranged and all particulars obtained on application to :—

Navy Estimates, and quoting the views of Lord Fisher as to the revolutionary effect of air power on future naval effort. Therefore, the Admiralty must be better treated in aerial matters.

He could see no reason for the dual appointment save economy in that both Departments share the expense of the salary due to the Secretary of State, which, though his work is doubled, remains at the standard rate of £5,000 a year.

He repeated his statement that Mr. Churchill could only give one-tenth of his time to the Air Ministry, quoting, curiously, as support, the War Office statement "that they cannot answer their letters." Here Mr. Churchill intervened: "I never said I was not able to answer my letters."

General Seely: "No; but you never answered them."

Mr. Churchill: "That is very unjust."

Having thus exposed the futility and the personal nature of his grievances, he repeated his entire gamut of views and sat down.

Mr. Bonar Law, as Leader of the House, here made a statement in explanation of the position as the Secretary of State for War could hardly be expected to justify a situation for which he was not personally responsible

He rapidly came to the War Office letter question, and said that some people seemed to think that detail work was the concern of Secretaries of State.

"The right hon. Gentleman even carried that so far as to imply that because letters are not answered promptly by the War Office that therefore the Secretary of State must have more to do than he can do That really had nothing whatever to do with the case. I should say at once if the Secretary of State for War attempted to answer the letters in detail which came to the War Office that would be the best proof that he was unfit for his job and should be removed from it"

In regard to Major-General Seely's views as to the unworkable nature of the present arrangement, he said:—

"I would venture to say to my right hon. Friend and the Committee—and I think I can say it to him without any offence, and I am sure that in a sense he realises his position—I do believe that system has worked worse with him than would be at least possible with some who had not held so distinguished political posts in the past, and who had not his distinguished record in the War. I am afraid that throughout my right hon. Friend did not accept the position that he was only an Under-Secretary, to carry out the duties of the Secretary of State for Air."

There was no intention of doing away with the independence of the Air Ministry.

As to the powers of one man to do the work required by the two Departments, he indicated in many words that Mr. Churchill possessed sufficient energy and skill to undertake all that was required of him in these matters. He pointed out the absurdity of assuming that economy in the matter of the salary could have anything to do with the appointment.

In his view the two most important things at the moment in connection with the fighting Services of the Crown are the demobilisation and the arrangement of the Air Force in relation of the Army. It has to be decided where squadrons and other air units are necessary in the view of the Army, hence it is desirable that the ultimate departmental decision should be in the hands of one man. No such question is urgent in so far as the Navy is concerned. And with this general dissertation he concluded.

Lt.-Col. Moore-Brabazon Speaks.

Lieut.-Colonel Moore-Brabazon next caught the Speaker's eye. Referring to the Trenchard Memorandum [published in these pages last week] which he regarded as the most interesting aeronautical document ever put before the House, he said:—

"I see one or two lines in this Report which disturb me, and if I may I will read them:

"'In addition, there will be a small part of it (the Air Force) specially trained for work with the Navy and a small part specially trained for work with the Army, these two small portions probably becoming in the future an arm of the older Service.'

"Does that foreshadow a return to a small Royal Flying Corps and a small Royal Naval Air Service over and above a separate Air Force?"

To which Mr. Churchill promptly answered "No."

This satisfied Lieut.-Colonel Moore-Brabazon for the moment, but he asked "whether the cost of machines for these two separate Services will be borne on the votes of the other Service and not on the Air Vote?"

To this the reply was that the Air Force would pay.

He said that many obstacles hindered the Army and the Navy in their operations (such as wire netting, trenches, mines and submarines), but the Air Force had powers to which there was no answer. Aeroplanes could fly in a fog to a place hundreds of miles away without being seen. [One thinks that in referring to the absence of an answer the speaker revealed his lack of knowledge of anti-aircraft defence and its powers.]

Future wars would only be won by the "ultimate industrial resources of a country." The enemy's first object would be to attack the industrial arm of the State which in England is based on Birmingham, and in Scotland on Glasgow. Only one Force could defend it—the Air Force. [It is a little hard to see why the aerial arms of the two older Services working in co-operation with the other arms of their respective Services should not be quite as successful in defence. The gun and the searchlight will not cease to share the responsibilities of A.A. defence with aircraft.—Ed.]

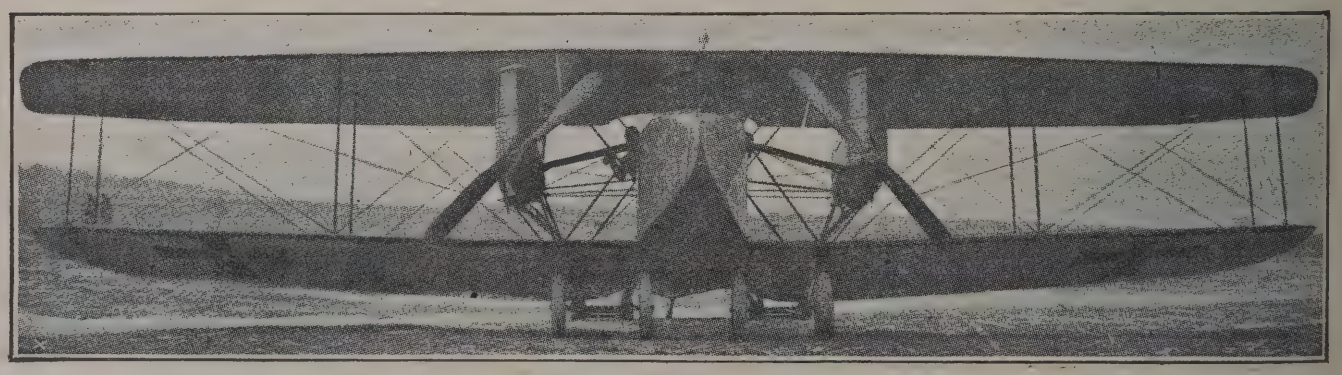
The Advisory Committee on Civil Aviation.

From war he turned to peace:—

"Now I want to say a word on civil aviation. I had the honour of serving on that Advisory Committee which has given a Report. First of all, the supremacy which this country has got to in the air is not entirely due to the military. That seems to be sometimes forgotten. I quite admit that there are many manufacturers who have become very wealthy, but that is not all they want, and I think, from the point of view of rewards, we have been very lax in looking after those brains and those organisers which, quite apart from any military point of view, have put us on top. I heard someone say the other day that if Wilbur Wright had been an Englishman he might have got an O.B.E. The Advisory Committee on Imperial Air Routes had an extraordinarily difficult task, because if there ever was anything in the air, so to speak, it was civil aviation. The whole question was the most nebulous I have ever approached, and nobody knew anything about it whatever. There were no figures, and what experience there was was only based on a military basis, and we had very little to go on at all. One very leading light was asked by us what was holding back civil aviation, and he replied, with very great confidence, 'Your Committee.'

"If anybody interested in the air has read the Report furnished by the Committee, I hope it will be noticed that really the demands are very moderate indeed. We took into consideration the financial condition of the country.

"What was at the back of our minds was how to avoid building up a goodwill against the State. We have seen necessities of life, like the telephones, started by private enterprise and then pushed on to State, the State having to pay for the goodwill created. What was at the back of our minds was to arrange some scheme whereby the State at some time could take control of all aviation throughout the world without having to pay for vested interests. The recommendation was that all aerodromes should be State-owned."



And so, after asking the Secretary of State to talk of these matters, he ceased to address the Committee.

Mr. Lambert protested against the joint secretaryship in fewer words but with greater simplicity than General Seely. Leaving this argument he quoted Lord Fisher and Sir Percy Scott on the approaching extinction of the surface ship unless it receives adequate aerial protection. Hence he argued the Air Ministry should be under the Admiralty and not under the War Office. [Which it is not in any case.—Ed.]

He protested against the expenditure on a cadet school at Cranwell which must, he thought, cost £1,000,000 at least in construction work alone. Why not use part of Osborne and Dartmouth, which he was sure would not be filled completely by Naval cadets in the future.

The training of officers in the R.A.F. in navigation, engineering and wireless was, he thought, very similar to that common in the Navy. An additional reason why Air Force officers should be trained in Naval establishments. Similar considerations affected the training of boys in the R.A.F.

Mr. Oswald Mosley, whose claim to be the "Child in the House" has been destroyed by Mr. Harmsworth, protested against the dual Secretaryship and appealed for a Minister of

Defence. Major Glyn, in the course of an interesting but somewhat rambling speech, said that anti-aircraft defence was highly important in view of the intensive bombing which would be the certain prelude of any future war. Consequently the Air Force should be developed as a separate force. "I think," he said, "the greatest point of all in maintaining the Air Force you are maintaining a great prestige. Those pilots who fell on British service have laid a tradition which is the envy of the world." [Yet it was a naval and military tradition which inspired them, for the Air Force had only seven months of warlike existence.—Ed.]

In further reference to anti-aircraft defences, he said:—

"When the war came to an end we had eleven squadrons of aeroplanes with the necessary landing grounds and alighting stations in the vicinity of London. We had a special telephone service and listening posts, and two or three barrages of coastal searchlights. We also had 280 anti-aircraft guns situated at suitable points, and, incidentally, I may mention that most of those points have been dug up, and who is to know where they were? I suggest that, at any rate, the concrete foundations might be retained and a cheap post put up announcing, 'From this place guns were fired to destroy the aeroplanes of the enemy.' Altogether we had 30,000 men on the establishment. Of course, you cannot depend altogether on anti-aircraft gunfire, and you must meet like with like."

In regard to civil aviation he could not understand why the Peace terms had left Germany in possession of about 8,000 aeroplanes. The Germans "have now 7,000 miles of aerial routes with alighting arrangements and definite transport services." Should we not, in view of this, do everything we can foster civil and military aviation? Was £15,000,000 enough in a normal year to spend on these matters?"

Rear-Admiral Adair continued the debate. In general his remarks were similar to those in his speech in the debate on the Naval Estimates. He advocated strongly the formation of a Naval Air Service and quoted Sir Hugh Trenchard in favour of aerial arms to the older Services. But thought it desirable to retain in addition a separate Air Force.

The surface sea-borne ship would, in his view, never be replaced by aircraft in the economic sense. In the military sense he thought that ships would improve contemporaneously with the development of aircraft. The torpedo was to abolish surface ships forty years ago. It has not yet done so. In fact a cruiser, fitted with anti-torpedo blisters, was torpedoed and improved its speed immediately.

The destroyer, or ships of destroyer size, capable of 70 miles on hour on the water and then spreading wings and passing through the air at 150 miles an hour was a certainty of the future, though perhaps not in his lifetime.

The one essential in the future was that the Admiralty should be responsible for Naval aviation. The Air Ministry was not competent to deal with such matters, not from general inefficiency but from lack of detailed knowledge.

Capt. Wedgwood Benn protested against any division of the Air Force. He did not agree that the Navy required a special type of aeroplane. It was not necessary to man seaplanes with seamen. The aviator's knowledge was of a special class and did not coincide with naval knowledge even on similar subjects. The wireless equipment was different, there was the art of flying and the special problems of the defence of the machine.

The Air Ministry had stated that there was no intention of dividing the Force, but he was a little uneasy at the attitude of the Admiralty because the First Lord in his speech in the Navy Estimates had not definitely stated that the Navy would not have an Air Service of its own. In regard to the supply of officers he did not wish the main supply to come from the public schools, which he assumed was the intention. Mr. Churchill interposed to say that there would be promotion from the ranks.

Captain Benn continued:—

"I do not think promotion from the ranks meets the case. My experience is that people promoted from the ranks never have the status of the officers who have entered direct. They are usually pushed into administrative or other jobs. At any rate, that is my view, and I think that the field should be absolutely open for boys to enter exactly on a parity from all social classes. The history of the War has shown that, although all classes contributed very nobly, by no means all the most brilliant pilots have been chosen from the class of boys to whom the whole thing would be restricted if such a plan were adopted."

The scientific side of the pilots' work should be developed. The present exaltation of the "stunt" pilot was bad for aviation. [Here one thinks that all are in agreement.—Ed.]

Research ought not to be starved. Civil aviation should be encouraged, as even from the military point of view it must not be forgotten that the larger machines used in war for bombing and the transport of relatively large numbers of men would be the outcome of the civilian type.

The Secretary of State for Air then rose to make his statement, which is given here in compressed form.

Mr. CHURCHILL: This Debate has been both peculiar and agreeable. It has been peculiar from the fact that it has taken a very different course from that on which it was originally launched by my right hon. and gallant Friend who opened it, and from the fact that out of, I think, seven speakers, five—I am not sure I should not be right in saying six—have all propounded different schemes for the location of the Air Force in our general defensive organisation, or for the general organisation of our defensive Services. First of all there was my right hon. and gallant Friend, whose policy is perfectly clear. He wishes to take the Air Force away from the Army. But there sat beside him on the bench the right hon. Gentleman the Member for South Molton (Mr. Lambert), who uprose and employed an argument of great vigour to show that it should be taken away from the Army only to be put under the Navy—thereby encountering my right hon. and gallant Friend on all his arguments as to the impossibility of one man doing two jobs, and of placing the Air Force in helotage to some other more powerful Service. Then we had the gallant Admiral the Member for the Shettleston Division of Glasgow, whose idea is that the Air Force should be split into three—that there should be three separate Air Forces, one for the Army, one independent, and one Naval Air Force—a proposal for which he was very properly and soundly rebuked by the hon. and gallant Gentleman (Captain W. Benn), who spoke last. We have had, too, a very interesting and suggestive speech from the hon. and gallant Member for Stirling (Major Glyn), who, as I gathered from his statement, is in favour of the general organisation of the three forces in the ambit of one single Ministry of Defence, supported by a Joint Imperial Staff. Amid all these divergent points of view, so powerfully argued, so ingeniously framed, and so eloquently expressed, I seem to have escaped from the direct pursuit which my right hon. and gallant Friend had intended to set upon my heels. That is why I say the Debate, as well as being peculiar, has been agreeable.

If I do not immediately embark upon an examination of these elaborate questions of government of the various defensive forces, I hope that those who have taken part in the discussion will not think it is because I do not consider them important and interesting, but for the moment I feel it to be my duty to recall the Committee to some of the more immediately practical issues and questions with which, in Committee of Supply, we have to deal. First of all I would like to refer to the financial aspect, because we have heard a great deal of it at one time or other in the Session, and it is surprising that it should never have been mentioned at all during the course of this Debate.

In March, Air Estimates were presented of approximately £66,500,000, and the present Estimate is for £54,000,000, so that there is an apparent reduction of £12,500,000. I say "apparent" advisedly, because £11,250,000 out of those £12,500,000 are transferred bodily from the charges of the Air Ministry to those of the Ministry of Munitions, and the actual net saving to the public on the new Estimates over the old is only £1,250,000. I am very anxious that the House should clearly understand exactly what the position is, and should not think that we are in any way trying to mislead them as to the actual financial position. This £150,000,000 would have been greater by £2,000,000 if the airships had remained on the Admiralty vote. We have had put on our charge £2,000,000 for airships which otherwise would have figured on the Admiralty Vote. Therefore the total net actual saving on the Air Estimates as now presented is £3,250,000. To this may be added a further almost certain saving on the Ministry of Munitions Vote through not going on with contracts instead of taking delivery of machines. That is to say that owing to the reduction in the demand we are wiping out contracts by compensation instead of by taking delivery, as was done the first few months after the Armistice. It is probable that the reduction will at least amount to £3,000,000, and it may be more; so that the total benefit to the Exchequer is in the neighbourhood of £6,250,000, to which may be added the £400,000 which my right hon. Friend was able to secure by his judicious sale of one of our airships to the United States, and possibly by other sales which are in contemplation and which were not foreseen when the Estimates were originally introduced. Therefore the saving is not £12,500,000, but the public may consider it is better off by the changes which have taken place by something between £6,000,000 and £7,000,000.

These Estimates which are now laid for the Army and for the Air Force are not the Estimates for next year. They are the Estimates for last year, which ought to have been presented in March. It was not possible to prepare them, and I promised that both Estimates should be laid before the end of the year. I am doing this in fulfilment of my pledge. But, of course, we are mates will be introduced. By the end of February or the beginning of March whoever represents these Departments will lay the new Estimates before the House, and there will be a long series of opportunities of Debate and discussion on all matters connected with Air and Army policy. I shall reserve till then the task of making a full statement on the Army. . . .

The Estimates of 1918-19 for the Air aggregated £370,000,000, including the Vote for the Ministry of Munitions for aircraft. In 1919-20 they have fallen to £54,000,000, and the limit which the Cabinet has approved for the framing of the Air Force Estimate next year is approximately £15,000,000, so that, whatever else may be said, a very great reduction is being effected in the scale of our expenditure.

But this scheme which has been prepared by the Chief of the Air Staff, working for a long period of time in collaboration with some of the other able officers who under his leadership rose to eminence in the War, has been commented upon with favour by practically every hon. Member who has spoken to-day.

I hope the Committee will not underrate the very considerable merit of the achievement accomplished in elaborating that scheme. During the present year the Air Force has had to be reduced from an enormous war organisation, rapidly expanded in every direction, down to almost nothing, and a modest, compact, permanent peace-time Air Force is being erected out of and upon its ruins. Whereas the Army and the Navy both had permanent pre-war structures to fall back upon and reduce down to, and were strongly organised and established on that basis, the Air Force had nothing at all except its emergency war organisation. At the same time a double element of uncertainty was playing over the whole field, namely, uncertainty as to the rate at which the German and Turkish situations would allow demobilisation to be carried out, and, secondly, uncertainty as to how much money would be allocated for the permanent post-war Air Force. It was inevitable during this period of arrest, of dissolution, of uncertainty, and of reconstruction, that everyone should feel disquieted and uncomfortable. The Air Ministry had not only to work out plans for the future in all their detailed complexity, but they had to have two or three sets of alternative plans carried forward simultaneously through all their variations and complications, so as to be ready to come forward with a complete scheme at an early date, in accordance with whatever scale of Air Force was ultimately sanctioned by the Cabinet. I confided this task to Air-Marshal Trenchard, and with his staff he has been engaged during the last three or four months on its execution. Early in October the Cabinet definitely approved a permanent organisation for the Royal Air Force on a scale of approximately £15,000,000 a year, of which the Indian charges will be borne by India. This organisation has now been elaborated in full detail, and every move in demobilisation, the transfer of stores, surrender of aerodromes, etc., has for some time past been made in direct relation thereto. The full organisation will, of course, be laid before the House when the Air Estimates for next year are produced. But the central principle which has always been followed throughout this year has been the maintenance of the independent status and identity of the Royal Air Force.

(To be continued.)

The Australian Flight

Another Great Triumph for

THE SMITH AVIATION INSTRUMENTS AND THE FAMOUS K.L.G. PLUGS

The Vickers-Vimy-Rolls Machine (piloted by Capt. Ross Smith, M.C., D.C.M., A.F.C.), which has just achieved the remarkable success of flying from Great Britain to Australia (10,000 miles in 28 days), was fully equipped with the following Smith Instruments and Accessories :—

Revolution Indicators — **Cambridge Radiator Thermometers**
Airspeed Indicators — **Husun Compasses No. 253**
and the famous K.L.G. Plugs.

It is also worthy of note that EVERY competitor in the Australian Competition—Capt. Matthews (Sopwith) ; Lieut. Douglas (Alliance) ; Capt. Wilkins (Blackburn Kangaroo) ; and Lieut. Howell (Martinsyde)—carried Smith Instruments and Accessories. Proving once again that for serviceability, accuracy and reliability the Smith Aviation Instruments and the K.L.G. Plugs have no equal.

THE AIR FORCE.

By the courtesy of the Secretary of the United Service Institution I am permitted to publish a précis of a lecture delivered on Dec. 3rd by Air Commodore Brooke-Popham, C.B., C.M.G., D.S.O., A.F.C.

The title is a little misleading as the lecturer dealt mainly with the problems and the material of flying.

He explained at the opening of the lecture the principal conditions affecting flight by human beings. The influence of wind on the pilot's progress and his dilemma if he does not know its strength and cannot see the ground are described. "I might mention that wind is always a disadvantage to an aeroplane if one wants to get to a place and come back again."

The next point to which attention was given was the effect on aircraft of the decrease in air pressure as the altitude increases. At 15,000 ft., for instance, "the air pressure is just half what it is on the ground." Hence the aeroplane has to be flown at a greater angle owing to reduced support, and as the resistance is reduced the speed will be greater (other things being equal, which they are not!). The engine deprived of the weight of air loses power. One well-known engine that gives 360 h.p. on the ground, only gives 200 h.p. at 15,000 ft. The propeller, on the other hand, rotates with greater speed owing to the rarefication of the air. "The net result of all these is decrease of performance with altitude." Commodore Brooke-Popham considers that "the only means of getting over this appears to be to use a propeller having some method of altering the pitch."

From the effects of altitude on the aeroplane the lecturer turned to the trials of aviators at great heights. "A temperature of minus 20 deg. Fahr., which is not unusual, is, I am informed, the average winter temperature at the South Pole. At this temperature any metal that is touched with the bare skin will have a serious effect. I remember an observer who for some reason or other touched his gun with his mouth, and left the greater portion of his lips sticking to it." The introduction of electrically heated clothing reduced greatly the discomforts of flying at great heights.

All of this is elementary and has little interest to those experienced in aeronautics. The interest began when he dealt more closely with the aeroplane in war and spoke of the advance made in the design, supply, and fighting efficiency of aircraft.

In August, 1914, there existed 272 aeroplanes in the R.F.C. and R.N.A.S. Of these, in his opinion, scarcely 90 were fit for service. The R.F.C. took with it to France on August 13th "thirty-two machines in units and a further twelve in reserve," leaving in England sixteen war machines which were sent over later. Thus with the exception of training machines and some others of which the only attraction was the charm of antiquity, England was left without aircraft. He notes as an interesting point that the engines in the machines sent to France were all of foreign design and manufacture.

When hostilities ceased the factories of England were producing ninety aeroplanes a day, fifty per cent. of which were of English design and all but a few were of English manufacture.

"During the last eighteen months of the war, the average wastage [of aeroplanes] was 51 per cent. per month, i.e., all the machines with squadrons in France had to be replaced once every two months, or six times a year. In other words, each machine only lasted an average of sixty days, which would only mean a little over sixty hours flying per machine."

The wastage due directly to enemy action never at any time reached 25 per cent., even if to this were added a proportion of the missing machines it is doubtful if the wastage due to enemy action ever amounted to more than a third of the total losses.

The lecturer then dealt with some of the problems connected with aerial navigation. He described the many troubles which affect the aeroplane compass and the methods by which these troubles were overcome. In his view, and in that of all wise pilots, good instruments are absolutely essential if one is to fly through clouds with reasonable safety.

One method of navigating aircraft when the land is invisible is by wireless. It is now quite a simple matter to find the direction from which a wireless signal is being sent, by means of a rotating coil. Consequently if the direction of two sending stations is known, it is possible to fix one's position by an intersection.

He emphasised the high value of wireless, both telegraph and telephone, in the development of aviation, and said that messages had been sent by wireless telephone from an aeroplane from over 100 miles. At the time of the armistice there were 520 wireless officers and 6,200 wireless other ranks in the Air Force in France alone.

A description was then given of bombing raids carried out by aeroplanes over German territory and the moral effect caused thereby.

The lecturer was under no illusion as to the great value of torpedo-dropping aeroplanes for future Naval warfare. "The normal range at which torpedos are dropped from aircraft is about 600 yards, and at this range a trained pilot will make a practical certainty of hitting a destroyer." A certain degree of defence for the aeroplane against the ships' guns can be provided by a smoke screen formed by convoying aircraft.

In reference to seaplanes and aeroplanes for use over the sea he described the flotation gear experiments carried out at the Isle of Grain, of which full details were given in a recent series of articles by Captain Sayers which appeared in this paper.

At the conclusion of his lecture he gave a few figures as to the fighting in France, which, being of general interest, are produced here.

"The best day we ever had as regards bringing down enemy aircraft was on October 30th, 1918, or to be strictly accurate, 4 p.m., the 29th to 4 p.m. the 30th. On that day we did in 70 enemy machines, and they were all properly crashed, not merely driven down out of control. Our casualties that day were 17 aeroplanes missing.

"With regard to bombing, our best day's work was in April, 1918, 4 p.m. 11th to 4 p.m. 12th, when we dropped 43¾ tons.

"As regards photographs, our best day's work was May 3rd, 1918, when 4,090 new photographs were taken.

"It may interest you to know that the total number of prints of aircraft photographs issued in France during 1918, up to the armistice, was over 6,000,000, the great majority of these being produced by the Air Force themselves. In that connection it might be interesting to note the consumption of a certain chemical, known as hybo-sulphite of soda. Ordinarily one buys it by the ounce. Our total consumption during the war amounted to 120 tons.

I am not quite certain as to the best day for the number of hours flown, but I know that on April 12th over 3,100 hours total flying was put in, which, when converted into miles, means a great deal more than sufficient to go from here to the moon."

THE FLIGHT TO AUSTRALIA COMPETITION.

The complete telegraphic diary of Capt. Ross Smith has now come to hand and is as follows :—

Nov. 12th.—The Vickers-Vimy left Hounslow at 9.10 a.m. Weather misty as far as Lympne, but Channel clear. Encountered heavy cloud of snow at Etaples, and climbed to 8,000 ft. Flew by compass course. Next saw ground three hours later over Roanne, after meeting further snow. Intense cold, 75 deg. frost; instruments frozen, machine covered with ice; food too frozen to eat. From Roanne ground visible times. Very relieved to see Lyons. Favourable wind throughout, but much time wasted avoiding storms. Vimy behaved splendidly. Arrived Lyons 3.40.

Nov. 13th.—Left Lyons 10.6, fine weather. Sunshine all day; few heavy clouds, otherwise perfect flying day. Flew along Riviera, crossed Gulf of Genoa; Remo, Spezia. Landed Pisa 2.40, too late to get to Rome. Going Taranto to-morrow. Alps looked very fine in sunlight. Vimy O.K.; crew well.

Nov. 14th.—Yesterday at Pisa heavy rain, aerodrome under water. Attempted to start, got bogged, and spent day on machine.

Nov. 15th.—Had engines running 8 o'clock to-day. Bogged badly in taxi-ing. Used planks and Italian mechanics dug out machine; bogged again, but finally got out. Start sensational. Serjt. Bennett (mechanic) held tail down until machine working, then made running jump at rear cockpit, hauled aboard by Shiers as machine was leaving ground. Aerodrome 2 in. under water, but Vimy rose beautifully. Crew very wet but cheerful. Encountered strong head wind, ground speed only 50 miles per hour. Passed through some heavy clouds, otherwise hazy and bumpy. Landed Rome 3 o'clock.

Nov. 16th.—Left Rome 9 a.m. Landed Taranto 11.45. Again low clouds, visibility bad. Passed over Capua and Naples, then turned east over mountains; flew low over Vesuvius, but weather too bad to photograph. Very bumpy over mountains, machine falling several hundred feet at times. Good wind helping us. Greatest assistance afforded us at Taranto by aerial route. Spent afternoon on machine.

Nov. 17th.—Left Taranto 8 to-day, arrived Suda Bay 4.35. Strong wind on our beam, low clouds, rain all the way to South

Greece. Attempted to get above clouds, but too high, so flew at 800 ft. Following coast, nearly hit small island in mist. South Greece to Crete good weather, slight head wind.

Nov. 18th.—Left Suda Bay 8 to-day, arrived Cairo 3.30. Weather again bad. Low clouds made crossing Cretan mountains difficult. Wind slightly favourable, steered south course after leaving, but had to fly through rain at 2,000 ft. most of the way across the Mediterranean. Passed two steamers halfway; checked ground speed and drift on them. Crossing took 2½ hours. Struck African coast at Sollum, then flew east to Cairo across desert via Matruh. Hope to reach Demascus or Baghdad to-morrow. All very pleased to have got here. Hope for better weather now. So far have taken 30 flying hours, mostly through rain and storms. Throughout greatest assistance rendered by aerial route stations, nothing being too much trouble. It is largely due to their excellent organisation that we are here so soon. Vimy going perfectly.

Nov. 19th.—Left Cairo 10.30; dull weather. Crossed Canal at Kantara, then over Romani along coast under thick cloud to Gaza. Turned inland to Ramleh, then Haifa. Owing to heavy rain flew low to Jordan over Sea of Galilee, thence to Damascus. Interesting seeing old places again, recalling memories of the war. Landed, Damascus 3. Met many old R.A.F. friends.

Nov. 20th.—Delayed until 11. First rain since March. Ground getting sticky. Oiled tyres to stop mud sticking, and left. Flew to Tadmor, turned east, crossed desert Abu Kemal, followed Euphrates. Met head wind and landed at Ramadie battlefield at dusk. Pegged down machine. Heavy gale at night. Turned out troops to hold machine; anxious time for two hours, but Vimy weathered the storm.

Nov. 21st.—Left Ramadie 1.15; good wind; first good flying day of journey. Passed Baghdad, Kut, Garden of Eden, landed Basra 4.40. Overhauling to-day; Bunder Abbas tomorrow. Yesterday weather cheered all considerably after ten days' trying conditions. Crew well; engines behaving beautifully.

Nov. 22nd.—At Basra overhauling machine and engines, making adjustments; nothing wrong.

Nov. 23rd.—Left Basra 6.30; perfect day, beautiful sunrise. Flew over Bushire along coast Persian Gulf, landed Bunder Abbas (Persia), 2.20. Nearly eight hours in the air; machine never faltered. Persian coast very rough and barren. Passed several R.A.F. emergency grounds. Welcomed here (Bunder Abbas) by British Consul, the O.C. troops, and the local Persian Governor. Great interest manifested by local inhabitants; some had never seen an aeroplane. Hope to reach Karachi to-morrow if wind favourable, otherwise Charbar.

Nov. 24th.—Left Bunder Abbas to-day 7.30, arrived Karachi 4.10. Good day, uninteresting scenery. Followed coast all the way. Engines and machine no trouble; crew rather tired after nearly nine hours' flying. Welcomed in India by General Fowler and Air Force, also a party of Australians who "coo'eed" lustily. Weather much warmer—a contrast with England 13 days ago. Hope to reach Delhi to-morrow if wind favourable.

Nov. 25th.—Left Karachi to-day 7.40, arrived Delhi 4.30. Journey uneventful. Good day, slight head wind. Met by General MacEwen and numerous others. All Air Force arrangements perfect; greatest assistance. During last three days have flown 25 hours, covering 1,600 miles. Machine and engines no trouble; crew well. Allahabad next, possibly to-morrow.

Nov. 26th.—Remained at Delhi resting.

Nov. 27th.—To-day at 10.30 flew over city 10 minutes, then started Allahabad. Near Muttra one oil gauge "dud." Landed and repaired. Continued; after 90 minutes landed at Allahabad 5 p.m. Good flying. Passed Taj Mahal at Agra, Cawnpore. Crew and machine well.

Nov. 28th.—Left Allahabad 8.30, arrived Calcutta 1.45. Good trip. Following wind, clear sky, uneventful. Landed on the racecourse; large crowd. All well. Akyab to-morrow.

Nov. 29th.—Left Calcutta 8.30; landed Akyab 1 p.m. A large and distinguished gathering to see us off, including Lady Ronaldshay and many cinemas and cameras. Great interest was displayed in machine, especially in the parts which flew the Atlantic with Alcock. The racecourse at Calcutta is small when taking off. Many hawks were circling round close to the ground. We were very frightened that a hawk would hit the propeller and smash it.

Just off the ground the machine struck two hawks, one hitting the propeller at a nasty moment as the machine almost hit the trees in avoiding more birds. No damage to the propeller, but pieces of hawk were hanging on the machine the whole journey.

Circled Calcutta and flew east to Chittagong across mouths of the Ganges, and then south in good weather. Poulet here. Both machines leave for Rangoon to-morrow. All well.

Nov. 30th.—Arrived at Rangoon. The Vimy and the Caudron first machines seen there. Both flew from Akyab across country to Irrawaddy River which followed to Prome. Thence guided by railway to Rangoon. Calcutta-Rangoon best part of journey. Leaving to-morrow for Bangkok.

Dec. 1st.—Arrived at Bangkok. Greatest assistance and courtesy shown by Prince Pitsanoluke and aviation corps.

Dec. 2nd.—Left Bangkok 7.0 and arrived at Singora at 1. Escorted first 50 miles by four Siamese machines. Course south along east coast of Malay Peninsula. First two hours good, then met heavy monsoon; rain, wind strong and changeable, sometimes helping and sometimes against. Necessary to fly 500 ft. three hours, following coast. Almost blinded with rain, but country impossible for landing. Had to continue, hoping for the best. Worst flying conditions ever encountered. Last hour better. The aerodrome at Singora is bad and stumpy. Had to land in a cross wind on a small dry patch. Safely down with luck. Later, taxi-ing the machine, tail skid caught root and broke fitting; not serious. Great interest of local population in seeing their first aeroplane. Decided that, owing to weather, we could not reach Singapore without more petrol. Wired Asiatic Petroleum Company, Penang, to send urgently. During night heavy squalls; crew held machine all night. Great assistance and hospitality, Prince Yugala and local officials.

Dec. 3rd.—Torrential rain with wind. Repaired skid, crew wet through, working on machine all day cheerfully. Petrol arrived evening; raining too hard to put in.

Dec. 4th.—My birthday. Weather bad. Decided to try for Singapore. Left Singora 10, arrived Singapore 5. Take off at Singora very rough, but convicts had cleared stumps yesterday. Aerodrome very wet in patches. Got off in a cross wind—lucky. Rain all the way. Flew 2,000 to 500 ft. all the way. Great reception here, huge crowd. Hope Java December 6th. Port Darwin, Dec. 10th. Vimy and crew well.

Dec. 5th.—Rested at Singapore.

Dec. 6th.—Flew to Kalidtjatti in Java, nearly 700 miles. Worst stage of journey as regards landing grounds. On arrival at the Dutch Military Flying School were greeted by the Governor-General of the Dutch East Indies and others.

Dec. 7th. Went from Kalidtjatti to Sourabaya. Uneventful trip. The aerodrome appeared hard, but was very soft underneath. Landed successfully, but when taxi-ing machine sunk to axles. Required 200 coolies to get machine out. Bamboo mat road then constructed. The machine was moved to end of the ground 400 yards in seven hours using the mats in relays. Dinner with British residents.

Dec. 8th.—At the aerodrome at daylight. By 9 a.m. had built mat road 300 yards in length. Attempted to start, but some mats caught the tail, machine swerved round and once more badly bogged. Dug machine out. At noon had constructed a road of laced mats 350 by 20 yards. Started again and succeeded in getting off. Flew east along islands and landed at Bima in Sumbawa. Excellent Dutch aerodrome. Well entertained by local Sultan and Dutch Controller

Dec. 9th.—Started for Atamboca in Timor Island, another Dutch military station. Entertained by commandant. Only 350 miles to Port Darwin.

Dec. 10th.—Up at dawn, rode to aerodrome, three miles on Timor ponies. Thick fog delayed us two hours. At 8.30 a.m. fog lifted and headed for Darwin flying by compass. At 10.30 sighted cruiser "Sydney." At 12.30 sighted Bathurst Island, first glimpse of Australia. Landed Port Darwin 3.30 p.m.

A correspondent writes :—

At the works the news of the landing of Capt. Ross Smith at Port Darwin was received at Vickers Weybridge works at 11.45 a.m. on Dec. 10th, but there was no boisterous enthusiasm displayed as when the Atlantic flight was accomplished, for the workpeople were confident of the success of of their machine after reading the reports of its progress. Nevertheless, everybody was manifestly proud of the achievement.—J. F. S.

The Martinsyde Disaster.

The Air Ministry announced on Dec. 16th that information received from official sources threw further light on the loss of Capt. C. E. Howell, D.S.O., M.C., D.F.C., and Air Mechanic Henry Fraser, who fell into the sea at San Georgio Bay, Corfu, on Dec. 9th.

The accident is reported to have occurred at 8 p.m. A naval motor-boat and some fishermen proceeded to the spot where the machine had fallen, but arrived too late to save the occupants. The machine is lying in 30 ft. of water, and is believed to be salvable, although the bodies of the crew have not yet been found.

The machine left Taranto at noon on Dec. 9th bound for Athens, a distance of 400 miles, and apparently the aviators must have lost their way as they only reached Corfu, which was on their direct route, at 8 p.m., a distance of 150 miles, after eight hours' flying. The machine had a cruising speed of 100 miles per hour, and it is conjectured that she ran out of petrol, as it is unlikely that she would be filled up with petrol for the short run to Athens. According to weather reports the day was misty.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE PRODUCTS OF THE BRITISH AIRCRAFT INDUSTRY.—II.

In the issue of December 17th, under this heading were described the aircraft, aero-engines, and aeronautical accessories manufactured by the British and Colonial Aircraft Co., Ltd., the Westland Aircraft Co., Wm. Beardmore, Ltd., Austin Motors, Ltd., Martinsyde Ltd., Parnall & Co., the Aircraft Manufacturing Co., Ltd., Short Bros., Rolls-Royce, Ltd., the Cosmos Engineering Co., Ltd., and S. Smith & Sons (M.A.), Ltd. In addition, the B.H.P. engines manufactured by Arrol Johnston, Ltd., the Galloway Engineering Co., and the Siddeley Co. were described.

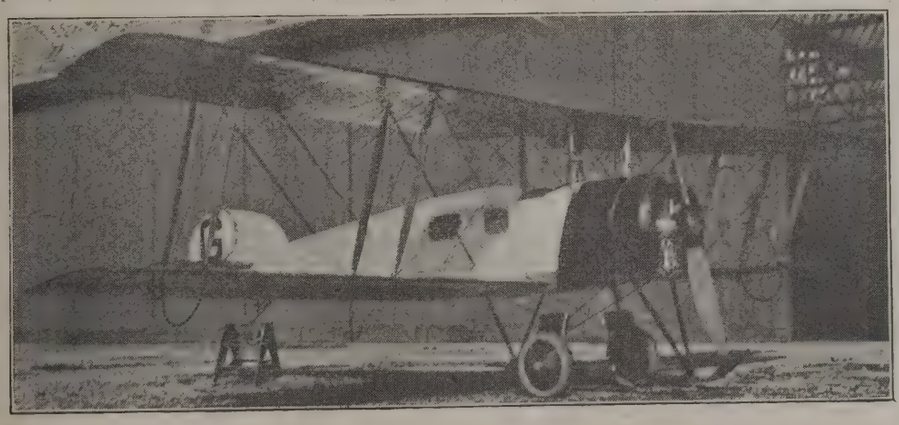
A further series of the products of other members of the Industry will be found below.

A. V. ROE AND CO., LTD.

The Avro firm requires little introduction to the world at large. Even in Germany its products were well known before the war, and during the war the Standard Avro two-seater has been a familiar sight in all Allied countries.

Of the early history of the firm it may suffice to mention here that in 1912, being then even a firm with an aeronautical history behind them, they had already produced and flown successfully two totally enclosed aeroplanes, the one a single-seater monoplane with a 40-h.p. 5-cylinder "Viale" engine, and the other the well-known "Military Trials" Avro two-seater with a 60-h.p. Green engine.

These two machines may properly be considered to be the direct ancestors of the modern "Limousine" type, and it is interesting to compare the two photographs here attached showing the modern Limousine version of the Avro, with the 1912 two-seater.



The ancestor of the "Limousine" Aeroplane. The all-enclosed Avro Biplane (60-h.p. Green engine), flying at the Military Trials, 1912.

THE AVRO "LIMOUSINE."

The Avro "Limousine" is essentially a modified Standard Avro training machine, fitted with a somewhat wider fuselage and centre section. Spare parts for the Standard type are also suitable for the "Limousine," and there is therefore no possible difficulty as to the supply of replacements, and, as the airworthy qualities of the original are conserved in the modified version the machine must be considered one of the most useful of small passenger-carrying craft.

The following table gives the main dimensions and the performance of this machine fitted with the B.R.1 engine. It is to be noted that, as with the standard machine, it is possible, to fit any of the Standard type rotary engines of from 100 to 150-h.p. and the A.B.C. "Wasp" of 170 h.p. to this machine without structural alterations.

THE NEW AVRO "LIMOUSINE."—This machine is one of the five-seater type Avros with the passengers' compartment enclosed. Two comfortably sprung bucket seats are fitted, and the cabin is provided with a door on each side of the body. Large Triplex glass windows are fitted.

SPECIFICATION.

Type	Enclosed "Limousine"
Name	Avro "Limousine."
Purpose	Passenger carrying, etc.
Span	36 ft. 9 in.
Wing area	335 sq. ft.
Tail area	26 sq. ft.
Elevator area	18 sq. ft.
Rudder area	9 sq. ft.
Fin area	6 sq. ft.
Ailerons area	45.5 sq. ft.
Engine and h.p.	150-h.p. B.R.1.
Airscrew, diam. and pitch and revs.	2-bladed Avro 9 ft., 7 ft., 1,300.
Weight of machine empty	1,431 lb.
Load per sq. ft.	7.42 lb.
Weight per h.p.	16.5 lb.

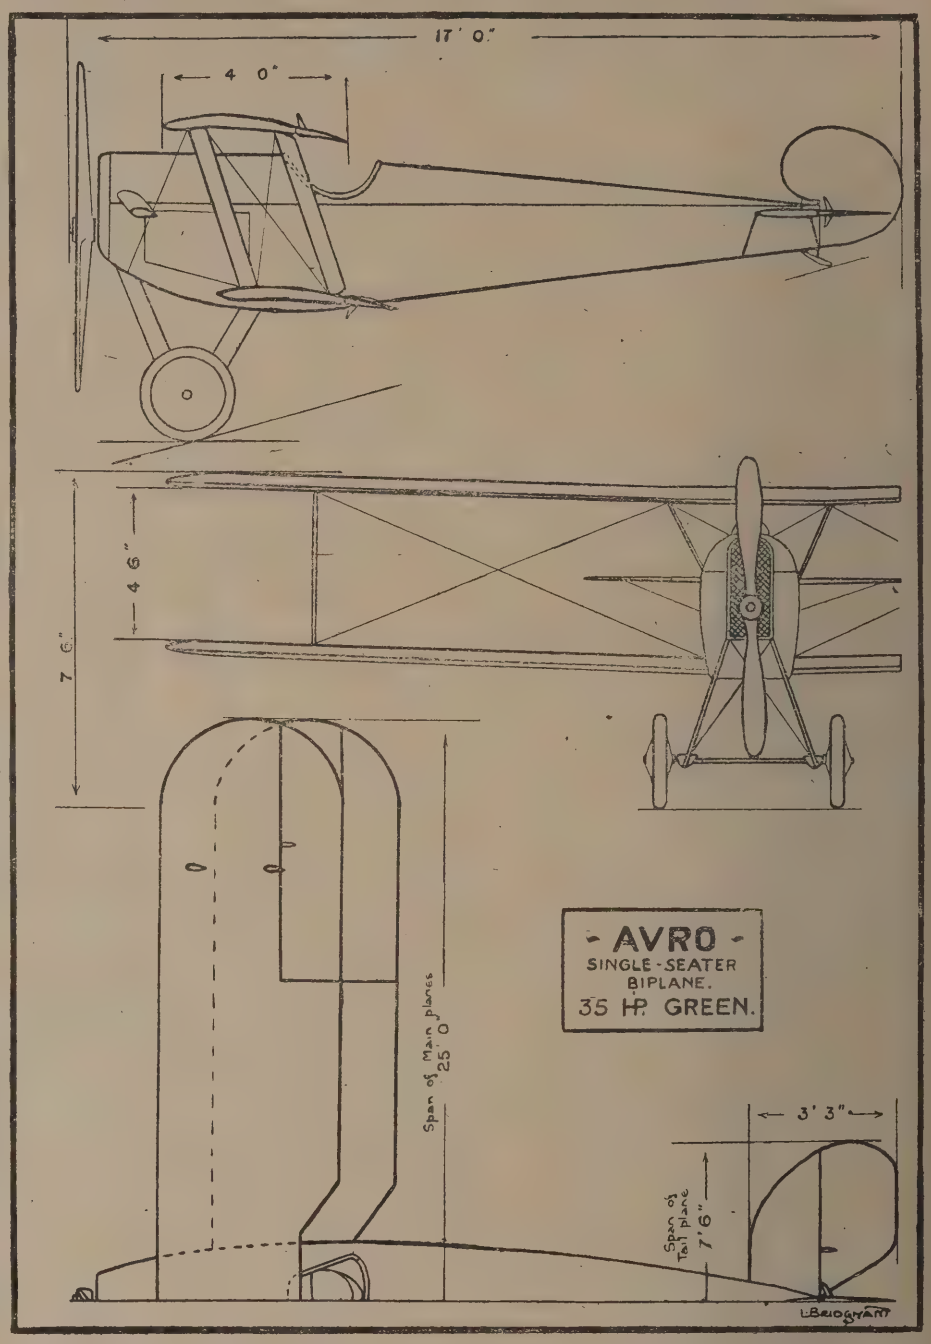
Performance—
Speed low down .....90 m.p.h.
Speed at 10,000 ft. .....75 m.p.h.
Landing speed .....40 m.p.h.
Climb—
To 5,000 ft. .....10.2 min.
To 10,000 ft. .....27.8 min.
To 12,000 ft. (Service ceiling) 41 min.

Other interesting recent products of the Avro Co. of a type suitable for sporting civilian use are the Avro "Baby" and the type 538.

THE AVRO TYPE 538.

The type 538 is a single-seater racing machine which can be fitted with any of the standard rotary or radial engines up to 170 h.p. In spite of its small size it is fitted with a double bay wing bracing, securing a light but sturdy structure.

The general particulars are :



Span .....28 ft.
Length overall .....20 ft. 6 in.
Height overall .....8 ft. 6 in.
Weight empty .....975 lb.
Weight loaded .....1,400 lb.
Petrol capacity .....26 gall.
Oil capacity .....6 gall
Total surface .....210 sq. ft.
Weight per h.p. ...9.35 lb. (150 h.p.).
Weight per sq. ft. .....67 lb.
Performance—
Speed at sea level .....125 m.p.h.
Speed at 10,000 ft. .....112 m.p.h.
Landing speed .....46 m.p.h
Climb—
To 10,000 ft. .....10 min.

Cruising range at ¾ power, 108 m.p.h.; at 1,000 ft.—320 miles. The above figures relate to the machine fitted with the 150-h.p. Bentley Rotary (B.R.1.).

THE AVRO "BABY."

The little Avro "Baby" fitted with the 35-h.p. 4-cylinder Green engine has already established a reputation by reason of its excellent performance in the London Aerial Derby—wherein it won the handicap—by its flight to Amsterdam and back, etc.

The whole machine is simple in construction, easy to house, the engine is reliable and very quiet in running, and the performance is, considering the low power used, extremely good. As the machine is stable and easy to fly, has a very low landing speed, and is capable of every brand of "stunt" yet known to the pilot, it represents an ideal machine for the sporting owner-pilot.

The dimensions, etc., are :

Span .....25 ft.
Length overall .....17 ft.
Height overall .....7 ft. 7 in.
Weight empty .....610 lb.
Weight loaded .....825 lb.
Petrol capacity .....6 gall.
Oil capacity .....1 gall.
Total area .....180 sq. ft.
Loading .....4.58 lb. per sq. ft.
Weight per h.p. .....20.6 lb.
Performance—
Speed at sea level .....80 m.p.h.
Speed at 10,000 ft. .....71 m.p.h.
Landing speed .....33 m.p.h.
Climb—
To 5,000 ft. .....11 min.
To 10,000 ft. .....25 min.
Cruising range at 1,000 ft. and at 65 m.p.h. .....200 miles.

THE BRITISH AERIAL TRANSPORT CO.

Founded in 1917 to exploit the designing capabilities of Mr. Frederick Koolhoven, the B.A.T. Company has quickly achieved a world-wide reputation as designers and constructors of aircraft of very high performance.

THE "BANTAM."

The first production, the B.A.T. "Bantam," designed in 1917 as a single-seat fighter, was an immediate success. The essential features of this machine were : the three-ply fuselage of oval section entirely devoid of internal bracing wires, and of a maximum depth equal to the interplane gap, and the use of a two-bay bracing on wings of only 25 ft. span, together with the provision of a very wide undercarriage with wheels set under the inner row of interplane struts.

The three-ply fuselage is light and simple, and is extremely difficult to damage by machine-gun fire.

The use of a two-bay bracing for the wings permits of a light structure combined with strength and rigidity. The wide chassis renders it extremely unlikely that the wing tips will be damaged when landing on even the roughest ground.

The engine fitted was the A.B.C. air-cooled radial "Wasp" of 170 h.p.

Throughout the machine every part is of the simplest possible design. There are no forgings, and cast and machined parts are practically absent. As a fighter the machine possesses unique qualities. The pilot is so placed that by raising his head slightly through a hole in the top plane he has a clear view round in all directions, while the sides of the fuselage under the top wing are so cut away as to provide a perfect view downwards both in front and behind the bottom plane.

The grouping of the principal loads near the centre of gravity and the careful disposition of the control surfaces make

THE FIRST BRITISH VICTORY.—The Sopwith Seaplane, with 100 h.p. Monosoupape Gnome engine, piloted by C. H. Pixton, winning the Schneider Cup Race at Monaco in 1914.

The B.A.T. "Basilisk" (A.B.C. 320-h.p. "Dragonfly" engine).

this machine exceptionally quickly responsive to its controls and consequently a redoubtable fighter.

The armament consists of two Vickers' guns firing through the propeller by means of the C.C. gear, and 1,000 rounds of ammunition; the guns being placed inside the fuselage on either side of the pilot, they are very accessible and easily attended to in the air.

The following are the chief figures relating to this machine :—

Span	25 ft.
Overall length	18 ft. 5 in.
Total area of planes	185 sq. ft.
Weight loaded	1,330 lb.
Military load carried	525 lb.
Petrol capacity	22 galls.
Oil capacity	2½ galls.

Range of action 3½ hours, equal to 440 miles at 15,000 feet.

PERFORMANCE—

Speed at ground level	135 m.p.h.
Speed at 10,000 ft.	134 m.p.h.
Speed at 15,000 ft.	127 m.p.h.
Landing speed	50 m.p.h.
Climb—	
To 3,000 ft.	1 min. 30 sec.
To 10,000 ft.	7 min. 19 sec.
To 15,000 ft.	14 min.
To 20,000 ft.	22 min.

THE "BASILISK"

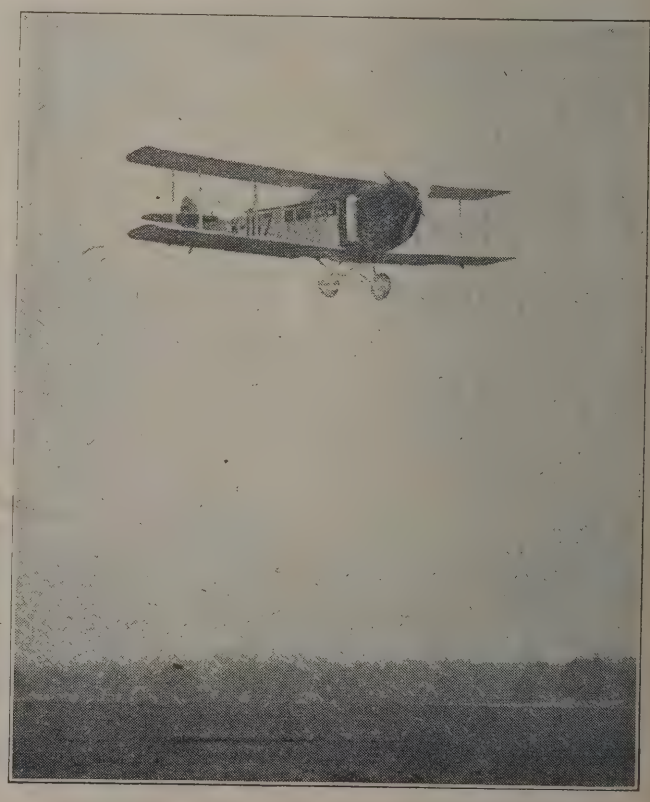
The B.A.T. "Basilisk," produced during 1918, was designed on lines very similar to the "Bantam," the main differences being an increased gap and chord, the setting of the pilot's seat aft the main planes, the raising of the upper plane to the level of the pilot's eye, and the installation of the A.B.C. "Dragonfly" of 320 h.p. The same simplicity and robustness of construction that characterised the "Bantam" is to be found in the "Basilisk," combined with a greatly improved performance.

The main dimensions of the machine are :—

Span	25 ft. 4 in.
Overall length	20 ft. 5 in.
Total area	220 sq. ft.
Weight (loaded)	2,000 lb.
Weight (empty)	1,275 lb.
Petrol	40 galls.
Oil	4½ galls.

Range of action 3 hours, equal to 475 miles at 10,000 feet.

PERFORMANCE—



Speed at ground level	162 m.p.h.
Speed at 10,000 ft.	154 m.p.h.
Speed at 15,000 ft.	144 m.p.h.
Landing speed	52 m.p.h.
Climb—	
To 10,000 ft.	4 min. 20 sec.
To 15,000 ft.	8 min. 30 sec.
Service ceiling	29,000 ft.

THE B.A.T. F.K.26.

This machine is quite an exceptional product, for it will always bear the distinction of being the first aeroplane ever constructed solely for commercial purposes.

The designs were commenced the day after the great Armistice of 1918 was signed, and the machine was flying—and considerably exceeded its expected performance—in the Spring of 1919. To those who follow aircraft design closely it must be interesting to hear—so accurately was the original design conceived and interpreted throughout the drawing office and workshops—that once erected and flown the machine needed no adjustment whatever. She was *au point* on her very first flight.

The object in view in producing the F.K.26 was to provide an aeroplane equally suitable for mail or goods carrying or passenger work—a machine of moderate price, having a definite speed and load capacity advantage and a high degree of

The B.A.T. F.K.26 Passenger-carrier in the Air.

S. E. SAUNDERS LTD.

Specialists in the design and construction of Seaplanes, Flying Boats, and every kind of Marine Aircraft.

Head Office & Works: EAST COWES, I.O.W.

Patentees and Sole Manufacturers of the famous Saunders

"CONSUTA"

SEWN PLYWOOD.

The finest material yet evolved for Aircraft Construction.

"CONSUTA," the Super-Plywood, is actually sewn together. The layers are first cemented together with waterproof material and then stitched through in parallel rows about 1¼ inches apart.

This gives a rigidity and resilience unattainable by any other method. Weight for weight, it is the strongest material yet evolved.

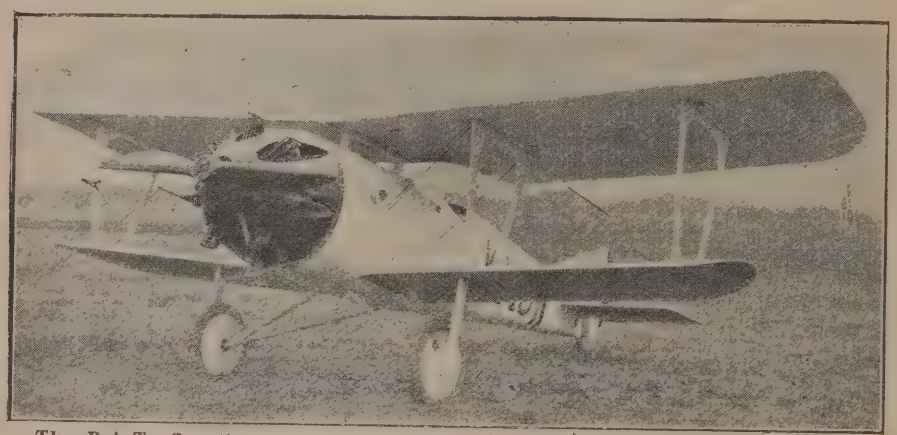
"Consuta" is used for the cabins of the commercial type of Vickers "Vimy" bombers, entirely dispensing with the use of cross-bracing wires. It is now being used for the whole covering of flying boats—the largest type yet built. Its uses are limitless.

The sheets are made to any desired size or shape up to 8 feet wide by 60 feet long, and from ⅛ inch to ⅝ inch thick, thus eliminating waste in conversion.

WE SHALL BE PLEASED TO QUOTE FOR YOUR REQUIREMENTS.

general utility. A single-engined machine of the capacity of F.K.26 was chosen because it is believed that this general type will most efficiently fill the requirements of civil commercial aviation for the next few years at least.

As far as postal air traffic is concerned, high authorities agree that machines carrying approximately 1,000 lb. useful load will be the most effective in fulfilling trans-Continental mail requirements. It is obvious that the success of a mail service will, given regularity, hinge entirely on speed, and it follows that it will be more advantageous to the general community to have a frequent and rapid service transporting moderate loads than a lethargic and slower service catering for the very high load.



Three-quarter Rear View of the B.A.T. Sporting two-seater.

The same applies to passenger transport. Until a definite knowledge of the passenger-carrying capacity required on the different routes is gained by practical experience, it will be more economical and efficient to employ machines of moderate accommodation always working at full capacity than to run the risk of having larger and more costly machines flying with one half, or less, of their full remunerative load.

So much for the aim underlying the design of this type.

In actual performance the F.K.26 is capable of taking a useful and remunerative load of 1,000 lb. with sufficient fuel on board to give her an effective range of 660 miles at an economical cruising speed of 110 m.p.h. Constructionally the machine is clean, simple and straightforward throughout, which makes for ease and economy in effecting running repairs. One

The B.A.T. Sporting two-seater (200-h.p. "Wasp" A.B.C. Mark II engine).

of her most remarkable features is the cabin, which measures 8 ft. long by 6 ft. high by 3 ft. 3 in. wide, and which has no internal cross-bracings or obstruction to restrict the freedom of movement and comfort of the passengers carried. That such a large cabin could be introduced into a machine of such relatively small over-all dimensions (the fuselage measures only 35 ft. and the span 46 ft.) is exceptional, especially as it has been attained without sacrificing any strength at that part of the fuselage where the cabin is situated.

The landing chassis is a strong and sturdy job sprung by a combination of elastic and oleo shock absorbers working on the same principle as the recoil mechanism of a gun. With the machine's low landing speed of approximately 45 m.p.h., and such a strong but flexible chassis, safe landings are possible under circumstances where machines of less thoughtful design would suffer damage.

The tail is a more or less conventional arrangement; the stabiliser, however, is capable of incidence adjustment by means of a hand wheel by the side of the pilot's seat, to enable any variations of balance caused by any changes in the quantity or disposition of the load carried to be compensated for while the machine is in flight. The rudder is fitted at its lower extremity with a sturdy, well-sprung steerable tail skid, so that the machine may be manœuvred on the ground with ease and certainty.

The Rolls-Royce "Eagle VIII" engine is fitted as standard and is covered by a black enamelled cowl, the whole of which is detachable in order to give free and open access to the engine. The cooling is effected by two narrow vertical radiators on either side of the fuselage.

All engine controls from the pilot's cockpit to the engine compartment are positive, transmission being effected in each case by duralumin tubes mounted in ball bearings.

The engine may be started by the pilot from his seat.

THE B.A.T. SPORTING TWO-SEATER BIPLANE. TYPE F.K.27.

This machine was specially designed to avoid the disadvantages of the existing war types of machines when adapted for private purposes; these types invariably being either too bulky and expensive in upkeep or insufficiently powerful for all-weather use, and deficient in that speed which is, and will undoubtedly remain, the great advantage of aviation over all other means of transport. At the same time the sociability of a two-seater car has been aimed at.

The result is a small biplane, more or less of the same type as the famous "Bantam," but seating two persons side by side in such a position that, owing to the small chord of the bottom plane, a perfect view in all directions is obtained. There is ample space for luggage, and a very complete range of instruments is fitted.

Constructionally, the well-tried B.A.T. features are followed. The fuselage is entirely of three-ply wood construction, containing very few parts, easy to repair, and practically proof against any weather or climate.

The planes are quickly detachable by withdrawing six large pins, and detaching a few streamline wires. The number of the latter throughout the machine is very small, as incidence bracing is avoided by the special wing struts.

The engine is the 200-h.p. A.B.C. type "Wasp II," a radial 7-cylinder air-cooled type. It is extremely reliable and simple.

The chassis is also of the special B.A.T. type, the wide track of the wheels making landing exceptionally safe. The tail skid is steerable for manœuvring at low speed on the ground.

The span being only 26 feet by an over-all length of 20 feet, housing and handling is not a matter of difficulty. The performance is very high, a maximum speed of 140 m.p.h. being maintained, coupled with a landing speed of under 50 miles per hour. A height of 10,000 feet is reached in 7.5 minutes.

The B.A.T. "Crow" (40-h.p. "Mosquito" engine).

WESTLAND

If you are visiting the Paris Aeronautical Exhibition we shall be pleased to show you the Westland "Limousine" on Stand 20.

We shall also have another machine at Le Bourget Aerodrome for giving demonstration flights.

Above is illustrated the model we intend to exhibit. The first machine, which has been flying since last July, has proved an ideal machine for mail carrying or passenger transport-de-luxe.

For full particulars and arrangements as to trial flights apply to our London Representative, **Lieut.-Colonel C. H. MEARES**, c/o MESSRS. PETTERS LIMITED, 6, DEAN'S YARD, WESTMINSTER, LONDON, S.W.1.

WESTLAND AIRCRAFT WORKS

AIRCRAFT, YEOVIL.

The machine is easy to fly, and in every way suitable for the sporting private owner or for any purposes where a load of up to 200 lb. is to be transported up to 400 miles in the shortest possible time.

THE B.A.T. "CROW" TYPE F.K.28.

This machine stands in the same relation to the usual type of aeroplane as the motor-cycle does to fully-equipped touring car.

In size, one of the smallest aeroplanes in the world, in construction, the simplest ever designed, it stands in a class entirely by itself. It is a remarkable fact that the whole machine can be completely dismantled in a few minutes by the aid of only one small spanner and a pair of pliers.

For ordinary storing purposes, where sufficient hangar space is not available, the single plane is taken off by removing 12 nuts. There are no bracing wires, and consequently no trueing up is necessary.

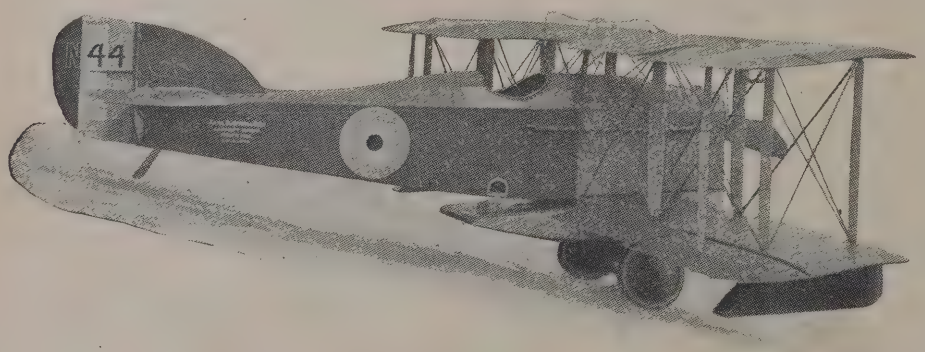
The pilot is seated under the plane in a little body on the big central skid between the wheels. This position, so near the ground, makes landing the machine on any sort of ground perfectly easy; in the case of very rough ground, the long skid prevents the machine turning over.

The engine, a 40-h.p. A.B.C. "Gnat," of the flat twin cylinder air-cooled type, is mounted on the front of the plane, and forms, with its mounting and the petrol and oil tank, a complete unit which is easily detached.

The torpedo-shaped tank holds 5 gallons of petrol and half a gallon of oil, sufficient for a flight of nearly two hours, covering a distance up to 120 miles.

It will be realised that this cheap miniature machine, with its unique position for the pilot, its extreme simplicity and accessibility, and its up-to-date flying capacities, is adaptable to a multitude of purposes in fields of utility which no aeroplane has hitherto touched. Among these, particular attention is drawn to its possibilities in the Colonies, for forest districts where the roads are the only landing space.

The "habitacle" of the B.A.T. "Crow."



MANN, EGERTON AND CO., LTD.

Mann, Egerton and Co.'s Aircraft Works at Norwich.

Mann, Egerton and Co., Ltd., of Norwich, commenced their operations in 1899 as electrical engineers, and added unto themselves very shortly after a motor-car department.

The combined businesses led to a considerable development of their affairs, which continued to increase in prosperity till the outbreak of war.

The Mann, Egerton "Seaboard Scout" (200-h.p. Hispano-Suiza).

The company then undertook a large quantity of war emergency work and constructed many ambulances, car bodies, etc., for official purposes.

Very shortly they were asked by the Admiralty to organise the manufacture of seaplanes, a task which they undertook with conspicuous success, and seaplanes and aeroplanes in large numbers were turned out by them to the order of the Admiralty, the Air Board, and the Air Ministry.

Amongst the types produced were Short seaplanes, Short land bombers, Sopwith one-and-a-half strutters, Spad single-seaters, DeH.9s, DeH.9as, De H.10s, and so forth and so on.

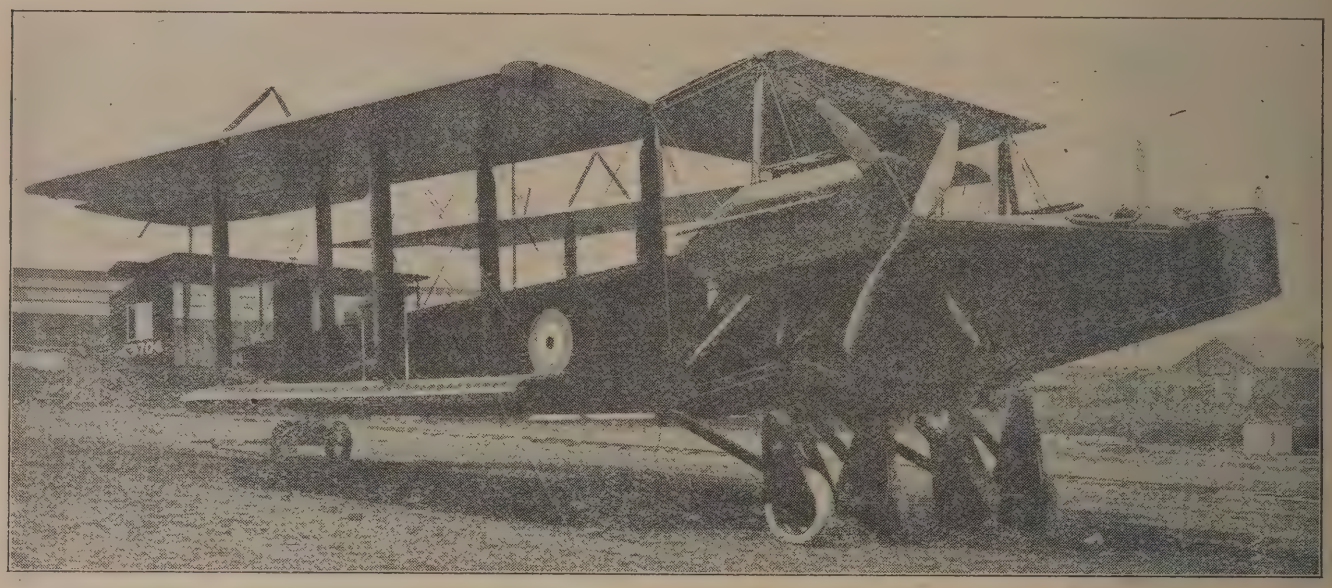
Aviation Department,

IMPERIAL COURT, BASIL ST., KNIGHTSBRIDGE, S.W.3.



In addition their own designing department was responsible for at least one experimental machine which gave an excellent test performance.

With the advent of peace Mann, Egerton's have naturally reverted to their established business of electrical and automobile engineers. They do not, however, propose to abandon the results of their wartime aircraft experience. They are retaining their aircraft design department and are prepared, in response to *bona fide* inquiries, to submit designs and estimates for aeroplanes to meet Naval, Military, or Commercial requirements, but they do not propose to build machines except against definite orders.

A Mann, Egerton-built Seaplane packed for road transport.

THE HISTORY OF HANDLEY PAGE, LTD.

The twin-engined Handley Page Type O/400 Biplane with wings folded (two 375 Rolls-Royce "Eagle" engines).

After two years of experimental work in connection with early efforts to design a successful aeroplane, Mr. F. Handley Page started business as an aeronautical engineer, and on June 17th, 1909, founded the company which now bears his name.

Works were erected at Barking, covering about 10,000 feet, for the construction of aeroplanes—an ambitious venture at that uncertain period in the history of aviation.

The first machine to be produced by the company was a diminutive monoplane known as the "Bluebird," partly because of the form of its planes and partly because it was painted blue. This pioneer machine makes an interesting comparison with the Handley Page machines of the present day. The tail of the modern Handley Page is nearly twice the size of its tiny forerunner, and it could with ease carry in its great fuselage many machines of the dimensions of the "Bluebird."

The "Bluebird" provided a certain amount of useful data before it reduced itself to wreckage on the flying ground at Barking. Various other monoplanes were designed, and some survived the rigours of the experimental periods and others did not.

In 1909 an experimental biplane was built for an aviation enthusiast in Liverpool, and in the same year a Handley Page monoplane was exhibited at the Aero Show at the Olympia, London. The following year another type of monoplane was exhibited, fitted with a low-powered horizontal engine with two opposed cylinders.

Slowly by this process of evolution data was accumulated, which eventually resulted in the design of an aeroplane which can be described as the first really successful Handley Page machine.

This was a monoplane, fitted with a 50-h.p. Gnome engine. Its first pilot, the late Edward Petre, christened it the "Antiseptic," owing to the non-rusting paint which had been applied to it. The machine was exhibited at the Aero Show in London, and it performed, what were for those early days, very creditable flights, one of which was between Fairlop, near Ilford, to the works at Barking.

The span of the planes of this machine was 35 feet.

The span of the latest type four-engined Handley Page aeroplane is 100 feet.

The speed of this early monoplane was 50-60 miles an hour and its carrying capacity was confined to one man. To-day, a multi-engined Handley Page aeroplane can carry 30-40 passengers at a speed in the vicinity of 100 miles an hour.

The "Antiseptic" is still preserved intact, for unlike most efforts of pioneer aircraft designers it did not figure on the scrap-heap of "fallen hopes." The machine now hangs from the roof of the Handley Page works at Cricklewood, and it is one of Mr. Handley Page's most cherished possessions.

A larger machine, fitted with a 70-h.p. Gnome engine, was designed for the military aeroplane trials on Salisbury Plain in 1912.

The War Office then entrusted the firm with the making of machines of the B.E. type.

In 1912 the works were removed to Cricklewood. In the first instance the ground occupied was about five acres. The workshops have since been doubled in size.

Despite the increasing activities of the firm, experimental work was still assiduously carried on. A biplane with a 110-h.p. Anzani radial engine was produced, which had a speed of 75 m.p.h. and made a good impression at flying meetings at Buxton and Hull.

Throughout these experimental periods work was always carried out on the lines of inherent safety. From that time until the present day the Handley Page firm has throughout adhered to its principle of great lift, safety and reliability rather than striving for sensational achievements in the direction of record breaking speeds and climbing performances.

The latter, though useful assets in other spheres, are not calculated to advance the cause of commercial aviation.

A new type of biplane on an ambitious scale was being perfected when the war broke out. It was to have been equipped with a 200-h.p. Salmson motor. The firm was taken over by the British Admiralty in 1914, and since then the works have been engaged on the production of "giant" machines with multiple engines.

Lest it be supposed that the giant type is entirely a product of the war, it should be pointed out that the firm had conducted frequent experiments with big machines before Europe

was thrown into a world-wide conflict. The results of these researches were placed before the Admiralty, who requested the immediate construction of a large experimental machine as suggested by the specifications.

Bomb-dropping was also studied by the firm to some purpose. Most Admiralty machines, in the latter stages of the war, were fitted with the Handley Page bomb-dropping gear.

THE TWO-ENGINE HANDLEY PAGE—TYPE O/400.

British Night Bomber, 1916-1918, Inclusive.

Span.—100 feet, (with wings folded) 31 feet.
Length.—63 feet; height 23 feet.
Weight.—Empty, 8,000 lb.; fully loaded, 14,000 lb.
Useful load (passengers, mail or cargo).—Two tons.
Number of passengers accommodated.—Twelve comfortably (20 if necessary).
Engines.—Two 350-h.p. Rolls-Royce "Eagle" 12-cylinder.
Petrol consumption.—40-45 gallons per hour.
Petrol tank capacity.—300 gallons (two tanks of 150 gallons each).
Maximum air speed.—95 miles per hour.
Touring air speed.—85 miles per hour.
Can maintain flight on one engine only, though at reduced speed.

History and Performances.

1915.—First machine designed and built for the Admiralty, left the ground at 1.51 p.m., December 18th.

1916.—July: An O/400 took 21 passengers to a height of 7,000 feet over London.

August: First squadron formed by R.N.A.S. at Dunkirk. From then till Armistice all British heavy night-bombing was done by this machine, numbers of which in use on Western Front increased rapidly.

1917.—O/400 flew from London to Mudros, via Paris, Rome, and the Balkans. Thence it bombed Constantinople, Adrianople, and other Turkish and Bulgarian towns on many occasions.

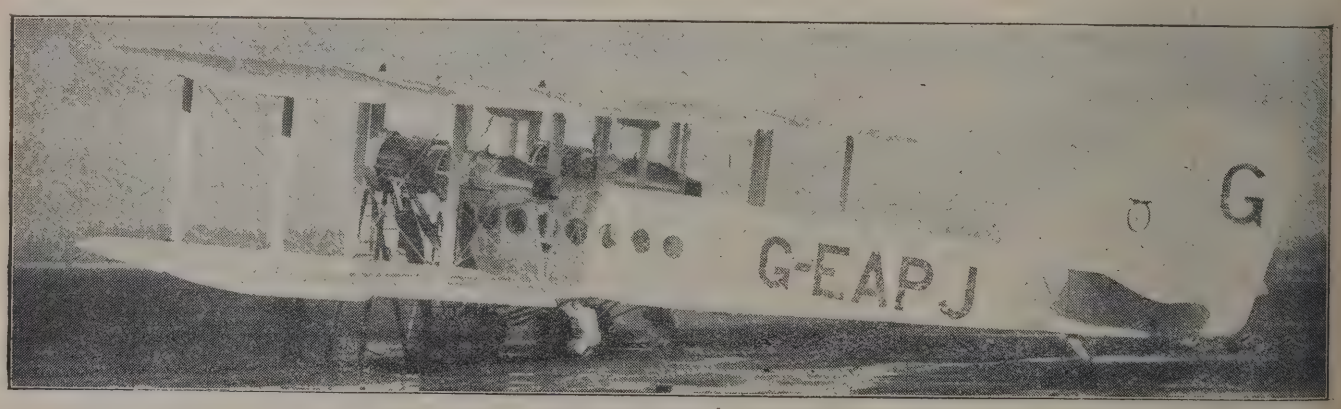
1918.—With Independent Air Force carried out extensive night raids over Rhine towns.

In our final offensive in Palestine, an O/400 played an important role, bombing H.Q.s and communication and doing the work of a squadron of smaller machines.

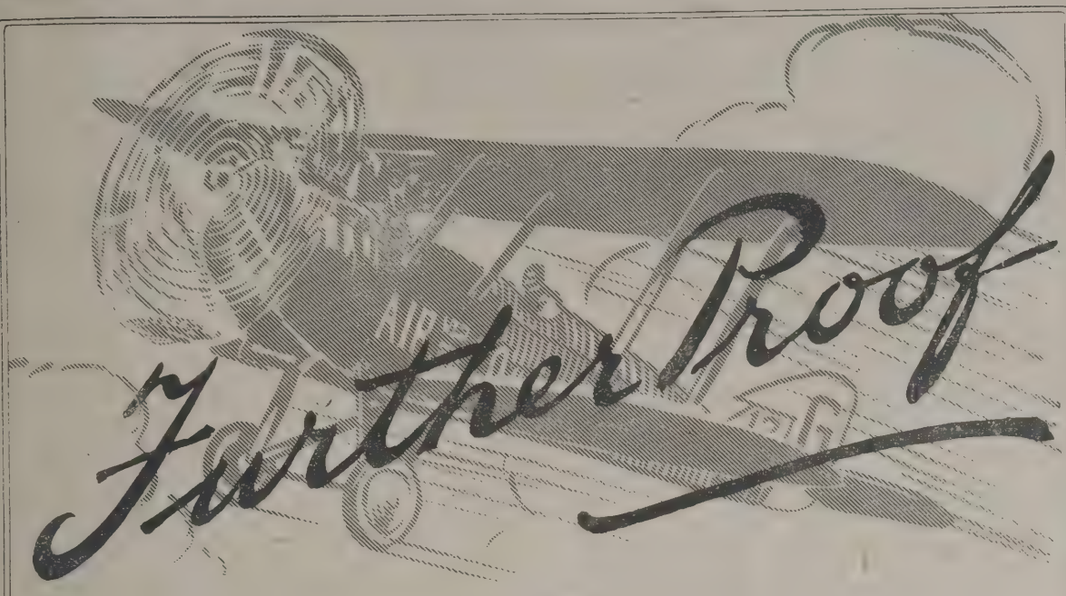
After the Armistice this machine returned to Cairo and flew from there to Delhi and Calcutta—the first machine to reach India by air.

1919.—Two military O/400s, H.M. Air Liners "Great Britain" and "Silver Star," fitted with saloon interiors, carried officials between London and the Peace Conference. One of them handled 700 passengers in a month of average winter weather.

Military O/400 performed the circuit of Britain—1,600 miles—in 30 hours' flying time.



This type was used for the first delivery of newspapers by air in May, 1919.



The Saloon of the W.8 Handley Page.

The Four-Engined Handley Page.

1918.—The four-engined Handley Page aeroplane was created for the purpose of bombing Berlin and designed

The new W.8 Handley Page Passenger-carrier (two 450-h.p. Napier engines).

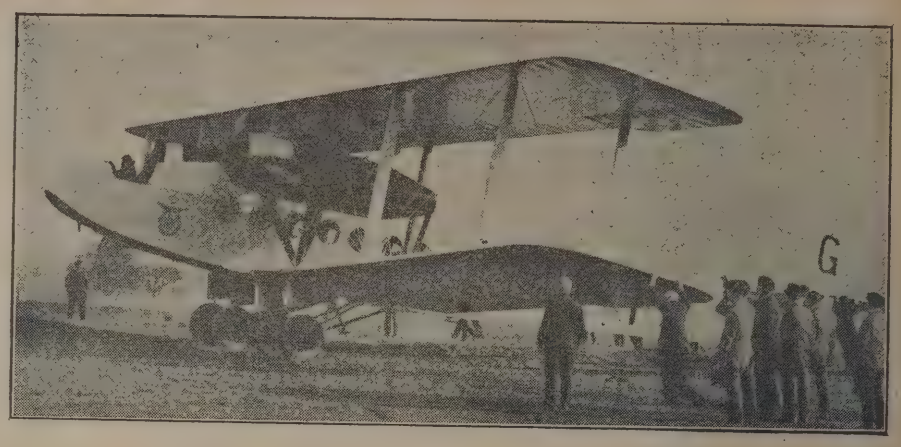
14, New Burlington Street, W.1. Works: ACTON, LONDON, W.3.

to carry a weight of five tons of passengers or cargo. The Armistice intervened before the weather was sufficiently favourable for a number of these machines to fly to the German capital.



A V/1500 on its first big trial flight flew from England to India, including one stretch of 800 miles overseas and another non-stop a stage of 1,00 miles, from Cairo to Baghdad.

In London this type lifted 41 passengers to a height of nearly 8,000 feet.

1919.—Long flights of 500-600 miles and more were accomplished by these Handley Pages, including non-stop journeys from Belfast to Sheffield, Belfast to Cromer, Belfast to Folkestone, and London to Biarritz.

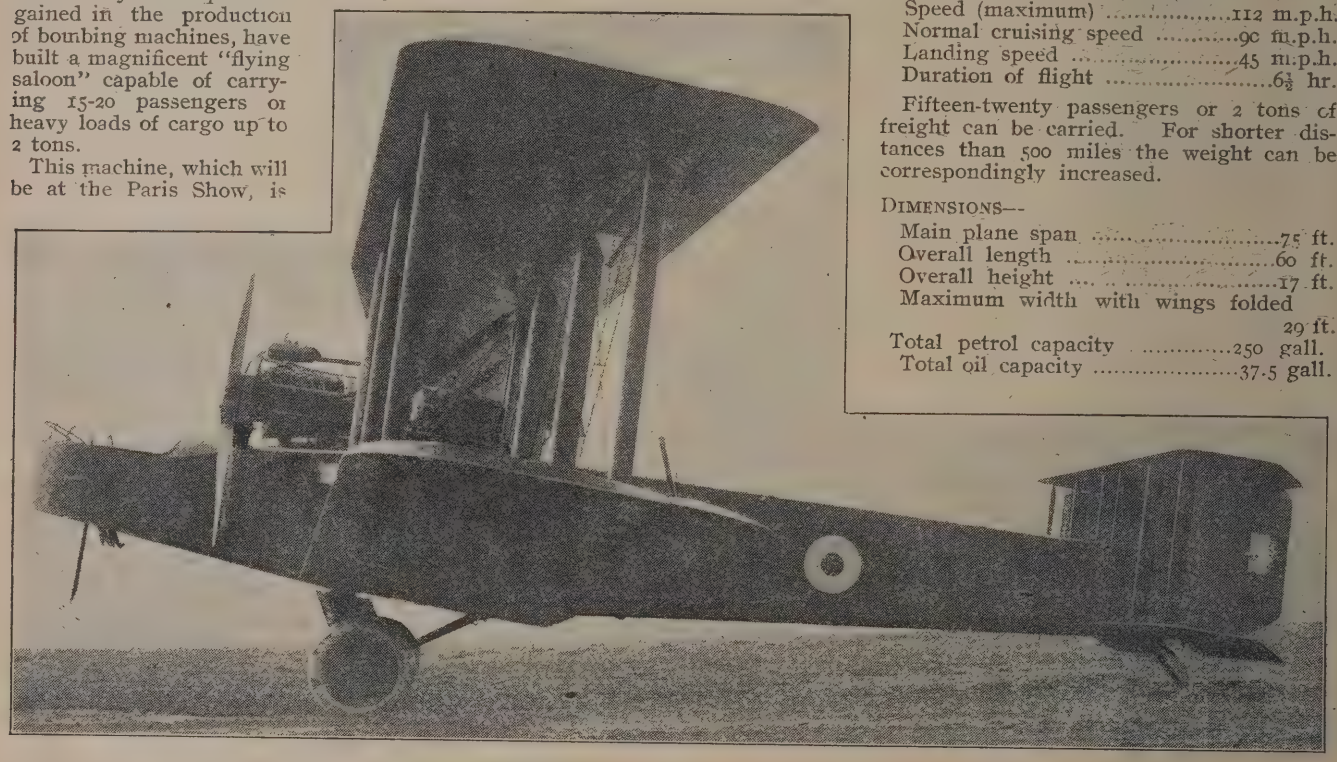
A four-engined Handley Page was entered for the Atlantic flight and during a test flight travelled from Newfoundland to Parrsboro, N.S., a distance of 600 miles, in 12 hours.

A V/1500 established a record by making a non-stop flight of 12 hours with 12 passengers on board.

The new W.8 Handley Page about to start for Paris.

THE HANDLEY PAGE W.8.

After lengthy experiment the firm of Handley Page, Ltd., assisted by the experience gained in the production of bombing machines, have built a magnificent "flying saloon" capable of carrying 15-20 passengers or heavy loads of cargo up to 2 tons.



This machine, which will be at the Paris Show, is shown in attached illustration, and the general dimensions, etc., are given below :—

Specification and Performance.

Type of Machine ..... Twin-engine biplane.
Engines ..... Two Napier "Lion."
Maximum available horse-power ..... 450 h.p. each engine.
Cruising horse-power ..... 350 h.p. each engine.
Performance with normal maximum horse-power—
Speed (maximum) ..... 112 m.p.h.
Normal cruising speed ..... 90 m.p.h.
Landing speed ..... 45 m.p.h.
Duration of flight ..... 6½ hr.

Fifteen-twenty passengers or 2 tons of freight can be carried. For shorter distances than 500 miles the weight can be correspondingly increased.

Dimensions—
Main plane span ..... 75 ft.
Overall length ..... 60 ft.
Overall height ..... 17 ft.
Maximum width with wings folded 29 ft.
Total petrol capacity ..... 250 gall.
Total oil capacity ..... 37·5 gall.

The Handley Page four-engined VI500 Type Machine.

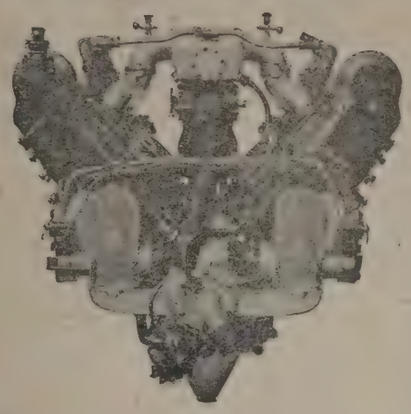
S. E. SAUNDERS, LTD.

During the war the firm of S. E. Saunders, Ltd., contributed a number of aeroplanes to the fighting services of the Crown, but as one would expect the greater portion of their output consisted of seaplanes.

These were almost, if not quite, entirely of the flying boat type, and with Mr. Saunders' unequalled experience of the building of light sea-going craft it is not surprising to learn that Saunders' built flying-boats had the best of reputations as staunch and seaworthy craft.

During the war period Mr. Saunders developed and brought to perfection the type of plywood construction known as "Consuta"—a modification of the original Saunders' sewn planking for racing boats—which was successfully applied to flying-boat hulls.

At the present time Mr. Saunders is busily engaged upon the design of a flying-boat amphibian machine from which it is safe to expect excellent results.

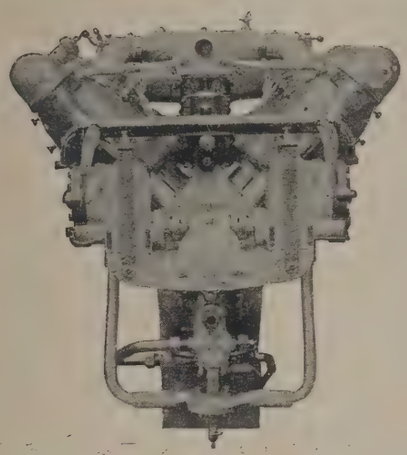


At the same time, in collaboration with Vickers Ltd., the firm is designing and building the hulls for superstructures built by Vickers.

AN ITALIAN VICKERS ACHIEVEMENT.

The Italian correspondent of The Aeroplane supplies the following notes on the recent developments by the Italian relation of the famous firm of Vickers, Ltd.

The Marchetti-Vickers-Terni Records.



More details are now known about the climbing and speed records claimed for this biplane at Rome. The climb to 5,000 metres in 11 minutes and to 6,000 in 15 minutes 20 seconds and the 274 kilometres 220 metres an hour over a straight kilometer in both directions are correct. The machine is not appreciably different from the type of the former record, indeed is mostly the same material. It is, barring some of the ribs, a metal-built machine all through, has a single strut each side, no ailerons or fixed horizontal tailplane and a very complete warping device. The motor is the usual Spa, but of 250-h.p., and the lowest flying speed is 85 k. per hour. Other measurements are : span 8.40, length 5.50 metres, and flying weight 900 kilograms.

200 H.P. 8-cylinder Sunbeam "ARAB" engine fitted with type AV8s B.T.H. Magnetos.

275 H.P. 12-cylinder Rolls-Royce "FALCON" engine fitted with type AV12s B.T.H. Magnetos.

200 H.P. 8-cylinder Wolseley Hispano-Suiza "VIPER" engine fitted with type AV8s B.T.H. Magnetos.

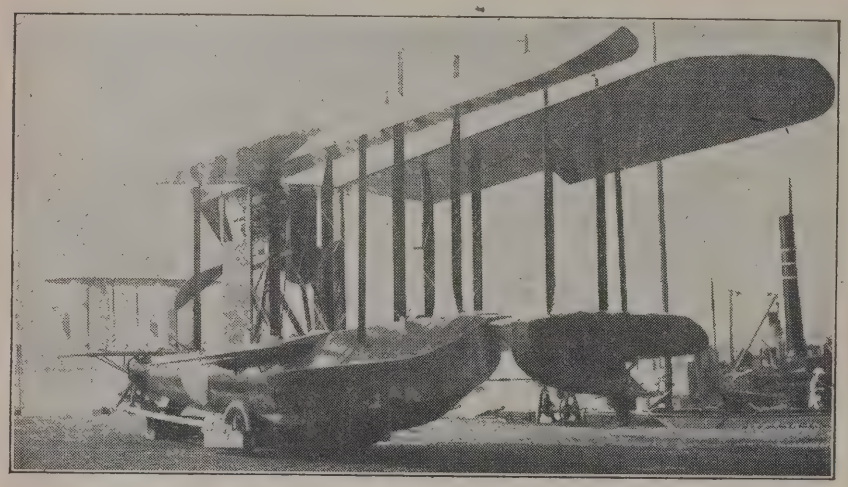
THE SUPERMARINE AVIATION WORKS, LTD.

The Supermarine Aviation Works, originally founded in 1912 as Pemberton-Billing, Ltd., were laid down specially for the production of aircraft of the flying boat type.

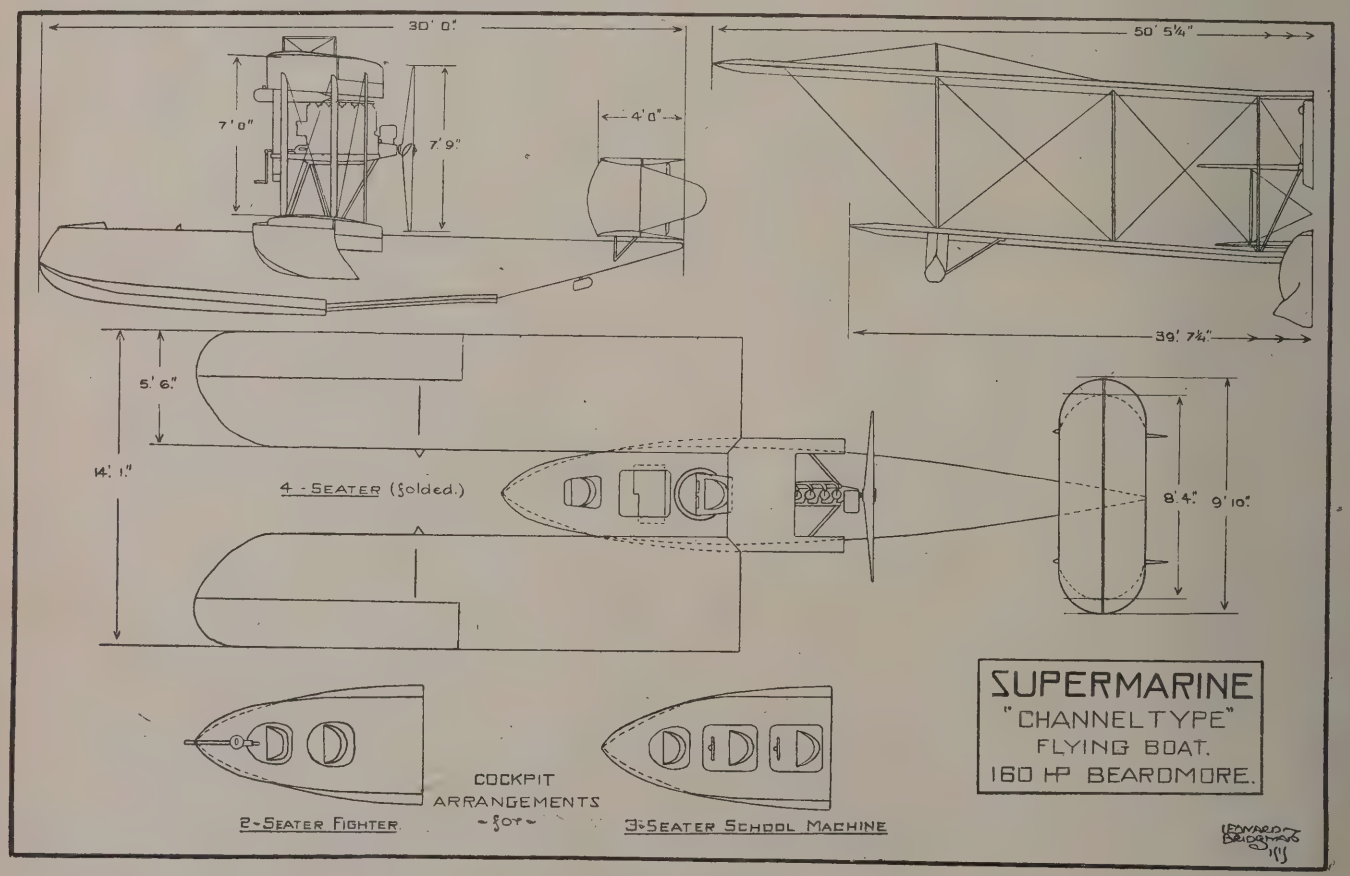


During the earlier part of the war their energies were to some extent diverted to the building of aircraft of other types, but the firm has more recently reverted to its original purpose, and is now exclusively concerned with flying boats and accessories.

During the war the company produced a two-seater reconnaissance machine of this type which, equipped with the 200-h.p. Hispano-Suiza, put up a remarkably fine performance, and the Supermarine "Baby"—a single-seat fighter flying boat with a very high speed.

The first type, modified in a number of respects and fitted with the 160-h.p. Beardmore engine, is to-day known as the "Channel" type, and is described below, together with other products of the firm

The Supermarine four-seater "Channel" Type Flying Boat (160-h.p. Beardmore engine).



The Supermarine "Channel" Type Flying Boat with wings folded.

THE SUPERMARINE "CHANNEL" TYPE.

This machine is a single-engined flying boat of moderate size, fitted with folding wings, and a hull built and designed by boat designers, and not with a fuselage covered with threeply or similar makeshift arrangement.

The engine is carried beneath the centre section and drives a propeller direct. Fuel tanks are carried within the hull, and the accommodation for the crew is ahead of the main planes, the exact arrangement of the seats varying with the purpose for which the particular boat is intended. These are shown in a drawing appended hereto.

Three types of this machine have been standardised, viz., two-seater fighter, three-seater school machine, and a four-

The Supermarine "Sea Lion" (450-h.p. Napier engine).

seater passenger machine, which has been tested and tried out efficiently during the whole of the varying weather conditions of the past year with highly satisfactory results.

As a fighter the machine carries pilot, observer, two guns, wireless, and fuel for five hours at 100 m.p.h.

As a school machine it is arranged to carry two pupils at a time—one at the dual control actually learning to fly, and the second as a spectator of his efforts, thus gaining experience of being in the air and a notion of what is expected of him later.

As a four-seater passenger machine it is claimed that this is one of the most serviceable commercial machines in the world. It carries 540 lb. of useful load for a consumption of one gallon of petrol to every eight miles.

This type was used during the past summer season to inaugurate the first passenger service in flying boats that has ever been established.

The season was most successful, and many passengers were carried at Bournemouth, Southsea, and at the Isle of Wight summer resorts. Trips were also made to Land's End, Plymouth, Weymouth, Newhaven, and Dover. During the railway strike the first port to port service, viz., from Southampton to Le Havre, was established very successfully with these machines, and stranded passengers on each side of the Channel were enabled to make rapid, safe and comfortable crossings.

THE SUPERMARINE "SEA LION."

This machine, which is said to be the fastest flying boat in the world, is a small, fast, single-seater, designed primarily for war purposes.

With the Napier 450 h.p. engine, 2½ hours' supply of fuel, and a load of 140 lb. of guns and ammunition, the speed is 147 miles per hour. The hull is guaranteed to stand up to practically any weather, and the machine itself may be looped, rolled, spun, or put through any of the manœuvres demanded by aerial fighting.

PASSENGER AND MAIL SERVICE TRIPLANE "DOLPHIN."

In addition to these machines the Supermarine Works have designed a large type of flying boat of 1,500 h.p. This machine has been designed for 24 passengers, 5 crew, 1½ tons of mails. It will be capable of going to sea in practically any weather conditions. Accommodation will be most comfortable and luxurious; the boat will be unsinkable, owing to special arrangement of water-tight bulkheads.

A larger type of machine is now going through the firm's design section, of 3,000 h.p. It will be in many respects of a progressive nature, as well as embodying the well-known principles of the Supermarine flying boats.

Over and above the actual flying boats, the Supermarine Works have undertaken the manufacture of a special seaplane tender, in the form of a 14-knot 35 ft. motor-boat.

It is capable of weathering out heavy sea-going conditions and is suitable for towing. It has large carrying capacity for transfer of passengers, and large petrol tanks and pumps for re-fuelling machines while collecting mails, passengers, and cargo. Special derrick arrangement can be installed, facilitating removal of mail-bags, etc. Fitted with wireless and machine-gun if required, it is exceptionally quick on the helm and a first-class, well-designed boat.

THE CENTRAL AIRCRAFT CO.

The Central Aircraft Co. have been engaged in the aircraft industry since 1909, and by genuine hard work have earned a name that is respected both for the design and building of aircraft and also as a school of extremely high efficiency.

The School of Aviation has been thoroughly reorganised since the war, and instruction is now given on training machines of the firm's design by a staff of fully qualified instructors. In addition to practical flying, a course of theoretical work is given conducted on entirely new and modern lines.

The range of machines that they are producting are the "Centaur 2a," a 320 h.p. twin-engined nine-seater biplane; the "Centaur 2b," a 460 h.p. twin-engined nine-seater seabiplane; the "Centaur 4," a 80 h.p. or 100 h.p. training biplane; the "Centaur 5," a two- or four-seater sporting or touring biplane; and the "Centaur 5a," which is a seaplane version of the "Centaur 5."

The "Centaur 2a" is a twin-engined biplane, and has been designed as a nine-passenger or commercial machine. It is fitted with two 160 h.p. Beardmore engines and follows usual practice in general arrangement. Accommodation is provided for two pilots and seven passengers, who are seated in an electrically warmed cabin which is fitted with windows of "Triplex" safety glass, or, as an alternative, by taking out the seats, accommodation can be found for 15 cwt. of mails or goods. Its general appearance can be gathered from the photograph. Folding wings are fitted, which enable the machine to be stored in quite a small hangar

The Pilot's seat and one power plant of the Central Aircraft Co.'s "Centaur 2a."

Three-quarter Front View of the "Centaur 2a" (two 160-h.p. Beardmore engines).

SPECIFICATION.

Type of machine	Twin-engined biplane
Type number of machine	"Centaur 2a"
Purpose	Commercial
Span	63 ft.
Width folded	30 ft.
Overall length	39 ft.
Surface of wings	900 sq. ft.
Engine type and h.p.	Two 160 h.p. Beardmore
Weight empty	3,160 lb.
Load per sq. ft.	6 lb.
Weight per h.p.	16.9 lb.

Tank capacity in hours .....3 hr.
Tank capacity in gallons .....75 gall.
PERFORMANCE—
Speed low down .....90 m.p.h.
Landing speed .....40 m.p.h.
Disposable load apart from fuel..2,240 lb.
Total weight of machine loaded..5,400 lb.

THE "CENTAUR 2B."

The "Centaur 2b" is a similar machine to the 2a, but is fitted with twin floats in lieu of the ordinary undercarriage, together with a tail float and water-rudder and two small cylindrical wing-tip floats. The total weight is somewhat heavier in view of the additional weight of the flotation gear and the larger and higher-powered engines fitted. In all other respects it is similar to the 2a.

The Central Aircraft Co.'s "Centaur 2a" twin-engine machine.

SPECIFICATION.

Type of machine .....Twin-engined biplane.
Name or type number of machine .....Centaur 2b."
Purpose for which intended .....Commercial.
Spau .....63 ft. 6 in.
Width with wings folded .....27 ft.
Overall length .....39 ft. 6 in.
Total surface of wings .....895 sq. ft.
Engine type and h.p. .....two 230 h.p. Siddeley "Puma."
Weight of machine empty .....4,240 lb.
Load per sq. ft. .....7.3 lb.
Weight per h.p. .....14.1 lb.
Tank capacity in hours .....3 hr.
Tank capacity in gallons .....81 gall.
PERFORMANCE—
Speed low down .....100 m.p.h.
Landing speed .....45 m.p.h.
Disposable load apart from fuel .....2,260 lb.
Total weight of machine loaded .....6,500 lb.

The Central Aircraft Co.'s "Centaur 4" (100-h.p. Anzani engine).

THE "CENTAUR 4."

The "Centaur 4" has been specially designed and adapted for school work, and as such has been produced with a view to low cost of maintenance and ease of repair. To this end a large number of parts are made interchangeable. All interplane struts are identical, front and rear struts being of the same length and dimensions throughout. Top and bottom planes are exactly alike and may be used in either position as occasion demands. The same remark applies to rudder and elevators. This, coupled with the fact that the machine is easy to fly and possesses a very low landing speed, makes it ideal for instructional purposes. A large amount of work has been put in on this machine and the school have done some exceptionally rapid tuition with it. Either an 80 h.p. Renault or a 100 h.p Anzani engine can be fitted.

SPECIFICATION.

Type of machine,
Two-seater dual-control biplane.
Name or type number of machine,
"Centaur 4."
Purpose for which intended..Training.
Span .....34 ft. 3 in.
Overall length .....24 ft. 8 in.
Total surface of wings.....331 sq. ft.
Engine type and h.p.,
Renault 80 h.p or Anzani 100 h.p.
Weight of machine empty .....900 lb.
Load per sq. ft. .....4.2 lb.
Weight per h.p. .....18.65 lb.
PERFORMANCE—
Speed low down.....75 m.p.h.
Landing speed.....32 m.p.h.
Disposable load apart from fuel .....500 lb.
Total weight of machine loaded .....1,400 lb.

THE "CENTAUR 5."

"Centaur 5" has been designed as a sporting and touring machine, and is fitted with side-by-side seats and folding wings. Simplicity and strength are the outstanding features of the design, and the fact that it possesses a low landing speed makes it extremely suitable for a private owner. In the "Centaur 5a" the ordinary land undercarriage is replaced by a single central float, together with wing-tip and tail floats. Arrangements can be made whereby either form of alighting gear can be fitted to the same machine with the minimum of trouble, thus providing a most serviceable and economical double-purpose aeroplane.

SPECIFICATION.

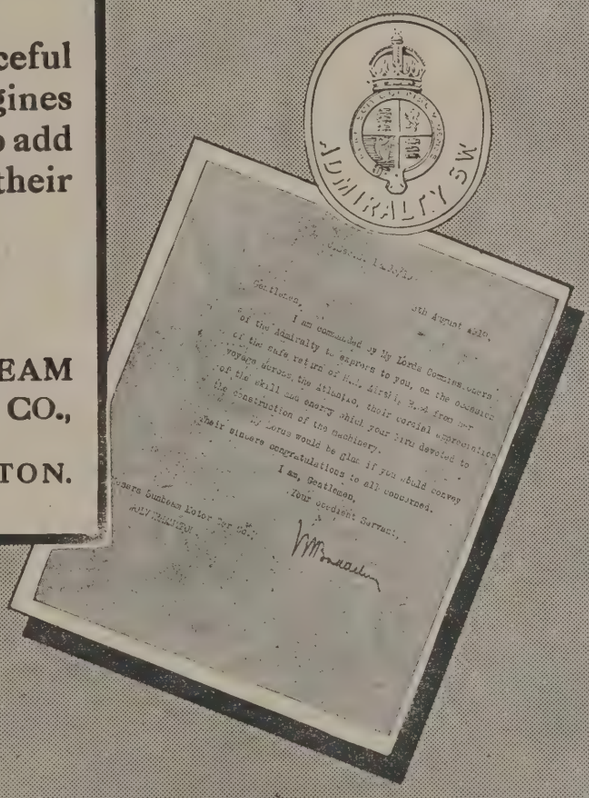
Type of machine .....Two or four seater tractor biplane.
Name or type number of machine .....Centaur 5" or "5a."
Purpose for which intended,
Sporting, touring, etc.
Span .....36 ft. 6 in.
Overall length .....26 ft. 6 in.
Total surface of wings.....396 sq. ft.
Engine type and h.p.,
100-110 h.p. Anzani
Weight of machine empty.....1,200 lb.
Load per sq. ft. .....4.55 lb.
Weight per h.p. .....18 lb.
Tank capacity in hours .....3 hr.
Tank capacity in gallons .....24 gall.
PERFORMANCE—
Speed low down .....80 m.p.h.
Landing speed .....30 m.p.h.
Disposable load apart from fuel,
600 lb.
Total weight of machine loaded,
1,800 lb.

AIRCRAFT TRANSPORT AND TRAVEL, LTD.

The Aircraft Transport and Travel Company's exhibit at the Paris Show will be staged in conjunction with that of the Compagnie Generale Transaerienne, the French company in association with which Aircraft Transport and Travel are operating the London-Paris mail, passenger, and parcels service.

A feature of the Aircraft Transport and Travel exhibit will be a series of very beautifully reproduced coloured photographs, illustrating scenes taken during the operation of the London-Paris service, and also the Airco machines which are used daily on this express route.

In addition to the photographs of machines, there will be models of the new Airco 18 aeroplane, which is to come into use on the London-Paris service in the spring; the five-seater Airco 16, which has already done such good service between London and Paris; and also of the Airco 9 and Airco 4a.



Front View of the "Centaur 4."

SUNBEAM-COATALEN AIRCRAFT ENGINES

contributed in no small measure to the aerial supremacy which was largely responsible for the Victory which crowned the Allied arms.

And in peaceful times, these Engines will continue to add to the fame of their name.

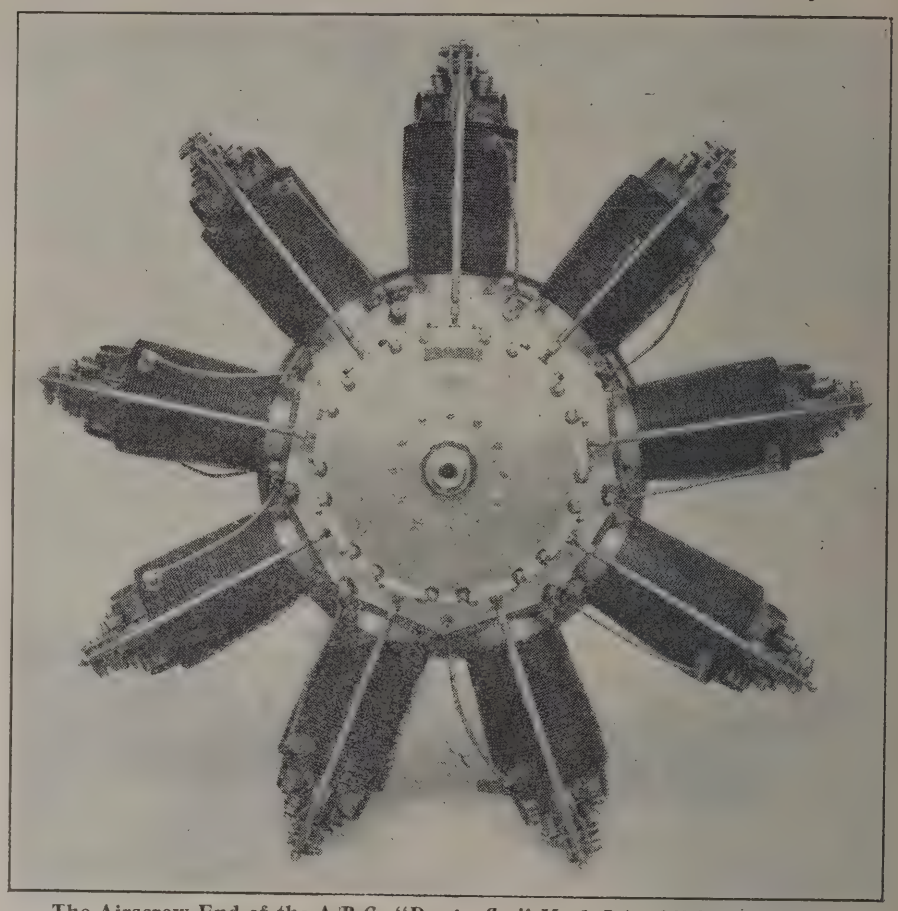
THE SUNBEAM MOTOR CAR CO., LTD.,
WOLVERHAMPTON.

A.B.C. ENGINES.

Walton Motors, Ltd., the manufacturers of the A.B.C. aero engines, have now decided to concentrate on the production of two types of aero engine for their post-war programme. These are the "Dragonfly" I.A. of 340 h.p. and the "Wasp" II, with a normal output of 160 h.p.

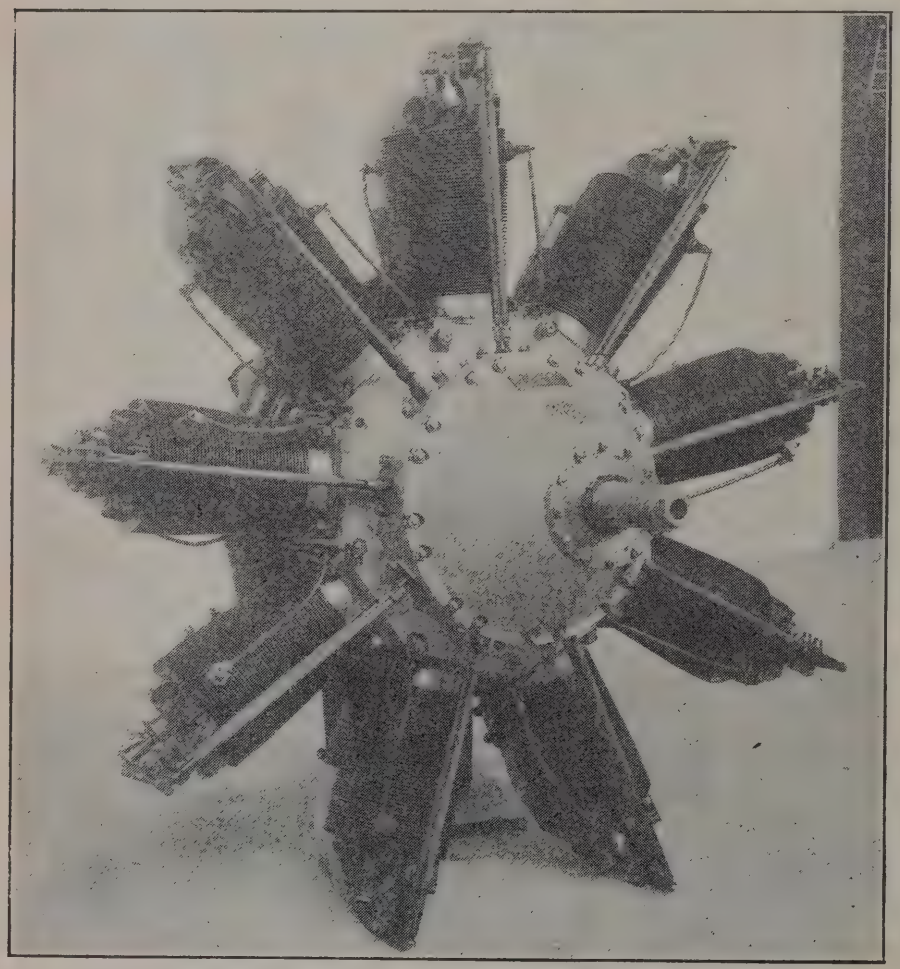
In general design the engines are alike, both are single-crank radial engines, the "Dragonfly" with nine and the "Wasp" seven cylinders.

The cylinders are of steel, turned from a single ingot, and with the cylinder heads integral with the barrel. The radiating fins are copper plated, in the well-known A.B.C. style, to assist in the dissipation of heat therefrom.



Each cylinder is equipped with three overhead valves, two exhaust and one inlet, operated through rocking levers and push-rods by a cam ring concentric with the crankshaft, which has four cams in the case of the "Dragonfly" and three in that of the "Wasp."

All bearings throughout are of either the ball or roller type, and in consequence very little oil is required for lubrication and there is no need for a high-pressure lubrication system.



The following data concerning performances of these engines in war aircraft serve as an indication of their capabilities :—

Performance of A.B.C. "Dragonfly" I.A. engine fitted to a warplane carrying guns and other military load :—

Height.	Time in min.	M.P.H.
3,000	1¼	156
6,000	2¾	150
10,000	4 4-5	144
15,000	8 2-5	143
18,000	10¾	141

The Airscrew End of the A.B.C. "Dragonfly," Mark I.A. 340-h.p. engine.

Another View of the A.B.C. "Dragonfly" Mark I.A.

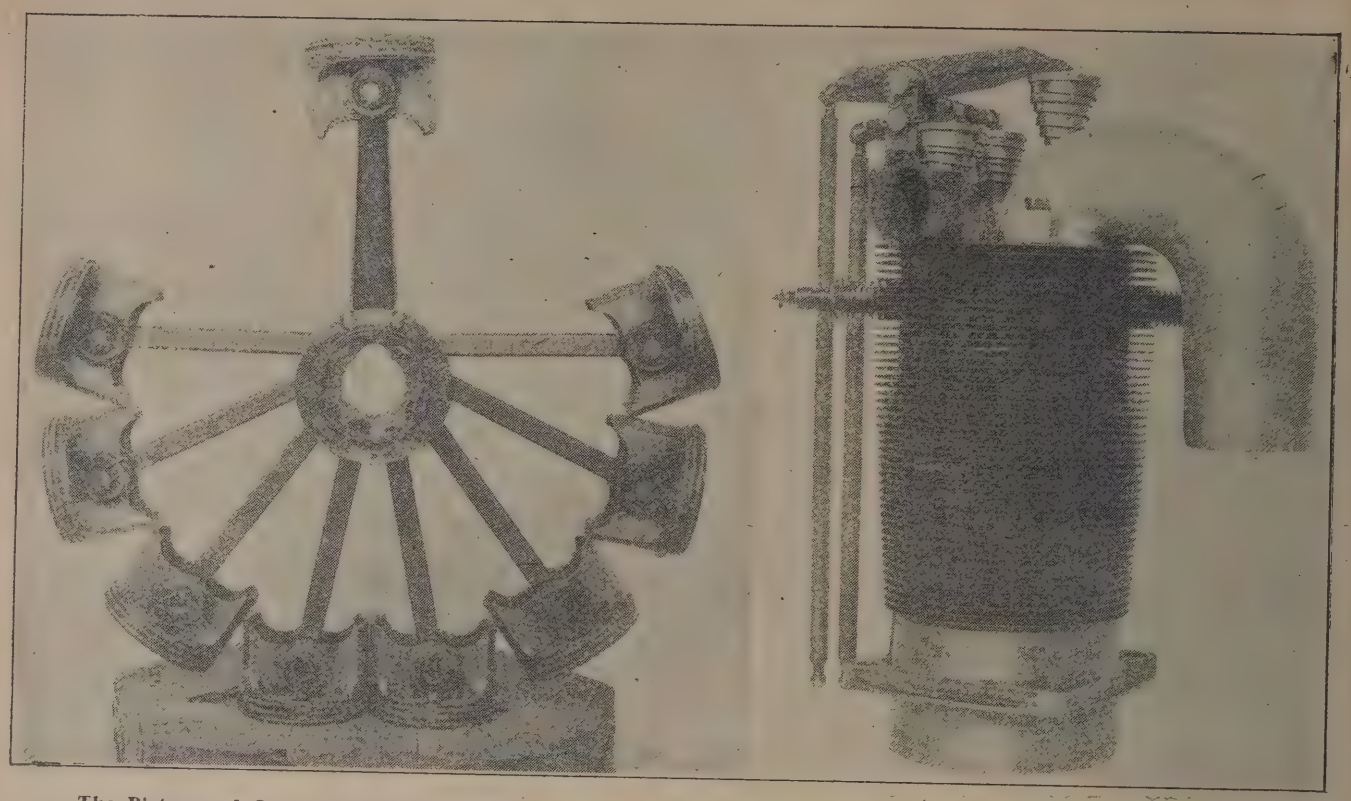
A height of 28,000 ft. corrected was obtained with this machine, the climb not being continued farther owing to lack of oxygen for the pilot.

Performance of A.B.C. "Wasp" I, 170 b.h.p. engine fitted to a B.A.T. Scout :—

Height.	Time in min.	M.P.H.
3,000	1½	—
10,000	5⅛	134
14,000	11¼	129

THE A.B.C. "DRAGONFLY" I.A.

SPECIFICATION.

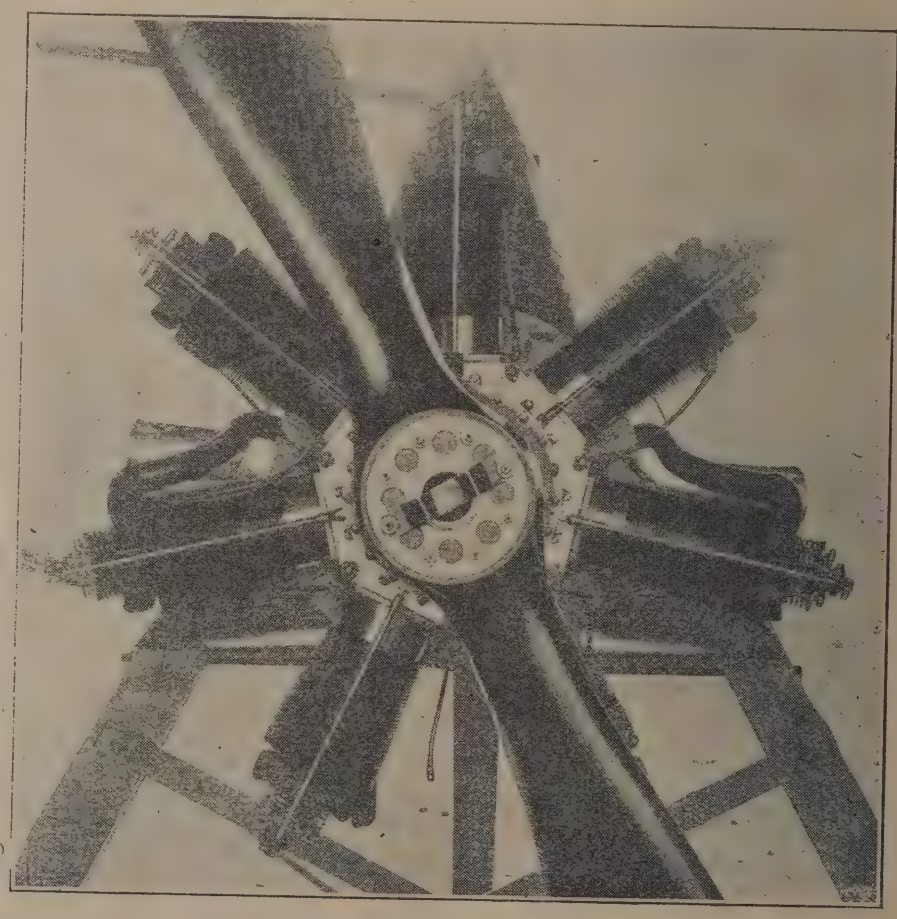


Type of engine. 9-cylinder static radial.
Type of cylinder.....Steel, fins A.B.C. copper coated, 3 overhead valves, 2 exhaust and 1 inlet.
Bore .....5½ in., equals 139.7 mm.
Stroke .....6½ in., equals 165.1 mm.
Normal b.h.p 340
Rotation ...Anti-clock facing propeller.
Normal speed .....1,650 r.p.m.
Lubrication—
2 rotary plunger pumps, 1 feeding through hollow camshaft to crankpin, centrifugal feed to big end and thence splash, 1 feeding to nose, dropping into cam and forming a permanent sump for gears in bottom of nose.
Oil recommended, Wakefield Castrol R.
Oil consumption .....7 pints per hour.
Oil consumption per b.h.p. hour, 0.021 pints.
Carburetters ...two A.B.C. carburetters.
Petrol consumption, 56 pints per b.h.p. hour.
Magnetos, two A.K.9 magnetos, 4 spark.
Speed of magneto .....1⅛ engine speed.

Telephone : WILLESDEN 2455.

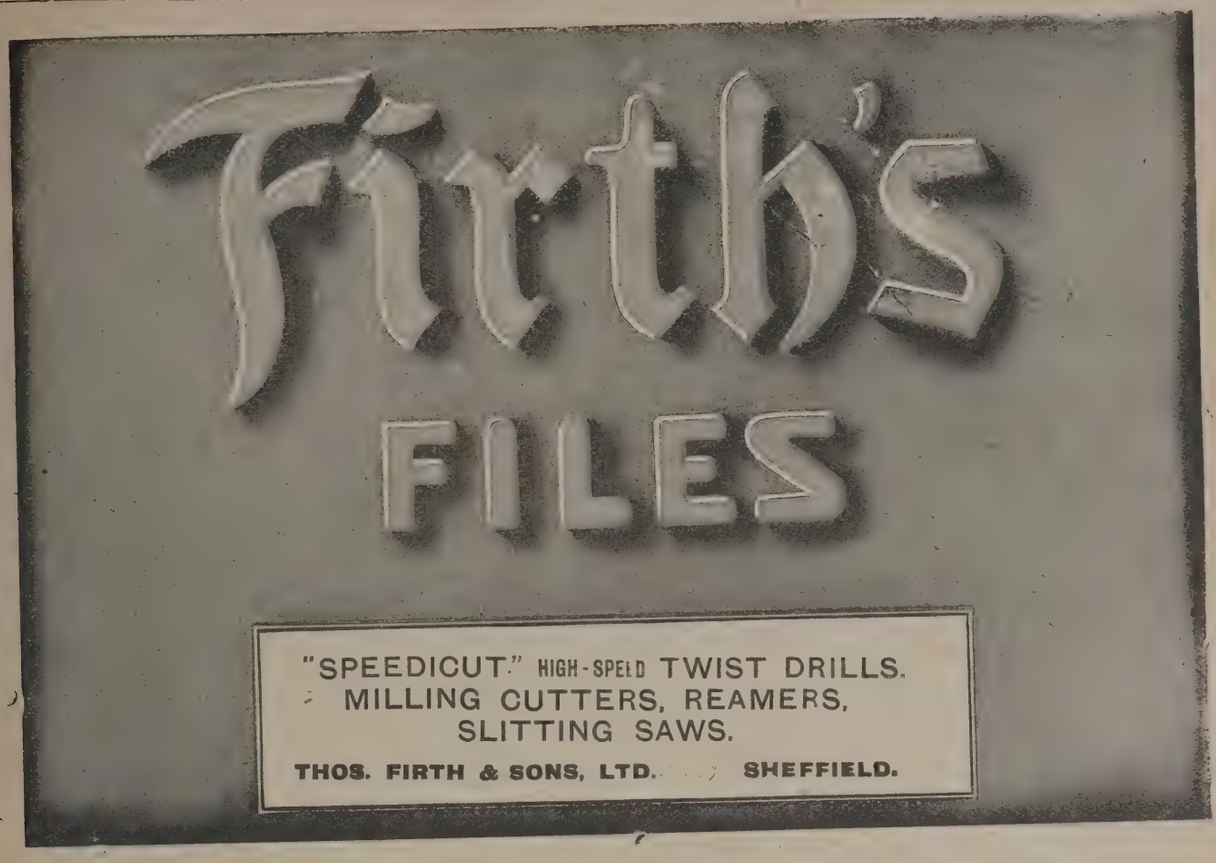
Telegrams : "NIEUSCOUT, CRICKLE, LONDON."

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.



The Piston and Connecting-rod Assembly, and one Cylinder complete of the A.B.C. "Dragonfly" engine.

Mag. rotates .....Clockwise facing driving end of armature.
Rev. counter rotates .....Anti-clock facing driving shaft.
Speed of rev. counter drive .....¼ engine speed.
Weight of engine, including airscrew boss, but without oil or fuel ...600 lb.
Weight of engine per B.H.P. ...1.765 lb.



THE A.B.C. "WASP II."

SPECIFICATION.

Type of engine...7-Cylinder Static Radial
Type of cylinder ...Steel, fins A.B.C. copper coated, 3 overhead valves, 2 exhaust and 1 inlet.
Bore .....4¾ in.
Stroke .....6¼ in.
Maximum B.H.P. 200 .....(normal B.H.P. 160).
Rotation ...Anti-clock facing propeller.
Maximum speed ..... 1,850 r.p.m. (normal speed 1,650).
Lubrication—
Two rotary plunger pumps, 1 feeding through hollow camshaft to crankpin, centrifugal feed to big end and thence splash, 1 feeding to nose, dropping onto cam and forming a permanent sump for gears in bottom of nose.
Oil recommended...Wakefield Castrol R.
Oil consumption .....6 pints per hour.
Oil consumption per B.H.P. hour... ...0.03 pints (based on max. B.H.P.).
Carburetters .....Two A.B.C. 48 mm.
Petrol consumption ....0.56 pints per B.H.P. hour.
Magnetos .....Two P.L. 7 type, 2 spark.
Speed of magnetos .....1¾ engine speed.
Mag. rotates ....Clockwise facing driving end of armature.
Rev. counter rotates ....Anti-clock facing driving shaft.
Speed of rev. counter drive ... ¼ engine speed.
Weight of engine, including airscrew boss, but without oil or fuel .....350 lb.
Weight of engine per B.H.P. .....1.75 lb.

The "Wasp II" A.B.C. engine of 160-200 h.p.

"CLERGET" PATENT AERO ENGINES

S.B.A.C. THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS

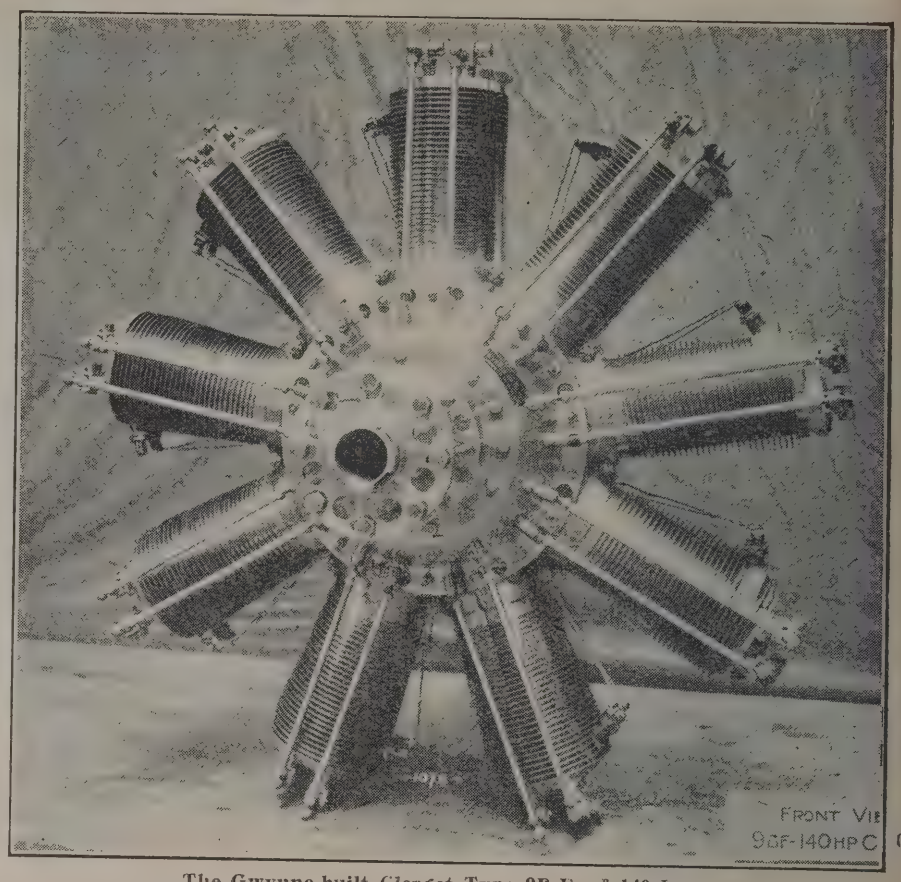
ENGINEERS, LONDON.

"GWYNNE, LONDON." "HAMMERSMITH 1910"

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS

GWYNNES, LTD.

The firm of Gwynnes, Ltd., of Hammersmith, owned a world-wide reputation as manufacturers of pumping plant—more particularly of the centrifugal type—long before aviation came into being.



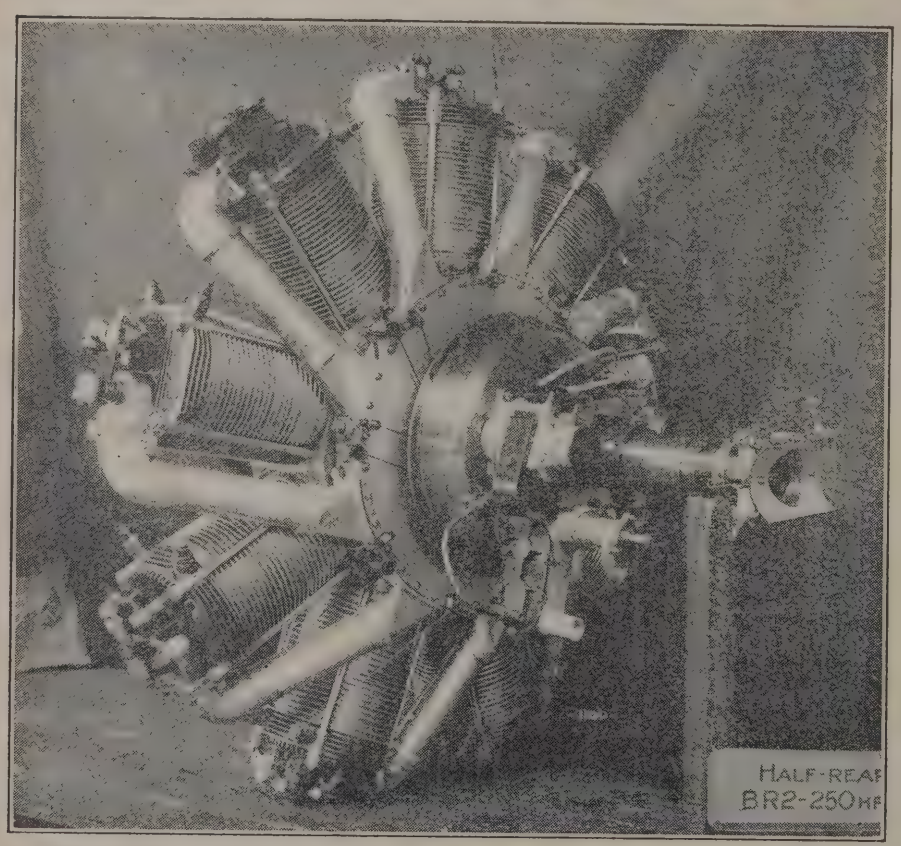
Quite early in the history of that art—before the war—Gwynnes took up the manufacture of rotary aero-engines of the Clerget type.

When war broke out they were one of the few firms who were in a position immediately to supply British-built aero engines, and, during the war, their production of these engines in the 80, 110, and 130 h.p. types became very large indeed. In addition, they produced in the latter stages of hostilities a quite considerable number of B.R.2 engines of 230 h.p. The output of Clerget engines during the war was roughly 2,750, and of B.R.2 engines, 900.

At the moment, Gwynnes, Ltd., are engaged upon the building of a small 9-cylinder 100-h.p. Clerget engine, with cylinders 105 mm. bore by 140 mm. stroke, which is designed to meet the demand for a light engine of low-running cost, giving on output sufficient for small fast single and two-seater machines.

This engine is built generally on the well-tried Clerget lines, and is in no sense an experimental attempt.

It may safely be assumed that Gwynnes, Ltd., are in a position to supply any of the other types of Clerget engines if a demand for them should arise.



The Gwynne-built Clerget Type 9B.F. of 140 h.p.

The types of engines manufactured by the firm so far are:
Clerget type 7Z—80 h.p., 120 mm. bore, 150 mm. stroke.
Clerget type 9Z—110 h.p., 120 mm. bore, 160 mm. stroke.
Clerget type 9B—130 h.p., 120 mm. bore, 160 mm. stroke.
Clerget type 9B.F—140 h.p., 120 mm. bore, 160 mm. stroke.

The three latter engines vary mainly in the matter of compression ratio.

The new engine referred to above is known as the 9J.

Magneto End View of the Gwynne-built 9B.F. Clerget.

A sectional drawing of this engine, which is unfortunately too full of fine detail to reproduce here, reveals the fact that with one exception the well-tried features of the previous Clerget models have been retained.

The two mechanically operated valves in the cylinder head, the valve gearing and the arrangement of magnetos, carburetter and oil pump on the rear mounting plate are exactly as in the earlier types of Clerget.

The exception is in the construction of the cylinders, which are now built up with a steel liner, onto which is pressed a separate cooling skin from which project the usual radiating fins—this being apparently of aluminium.

The number of low-powered single-seater machines now being built for the sporting pilot owner will undoubtedly lead eventually to a demand for small sporting two-seaters at reasonable prices and of reasonable performance, but not of colossal speed, and equipped with economical engines.

This demand the new Clerget should effectively meet.

The high qualities of the Clerget engines produced by Gwynnes in the past, and the effective work performed by them in such famous machines as the Sopwith one-and-a-half strutters and the "Camels," and the excellent work put into the B.R.2s should be an ample guarantee that any engine supplied by the firm will be made of the best materials, in the best type of workmanship and finish.

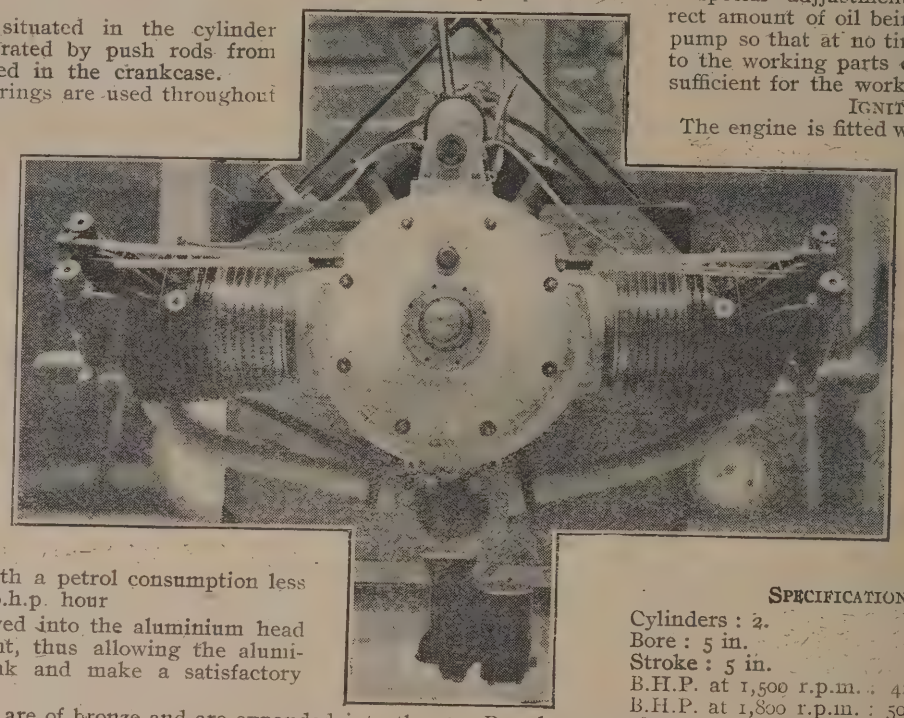
SBAC
THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS



THE ARMSTRONG-SIDDELEY MOTORS, LTD.

The Armstrong-Siddeley 2-cylinder aero engine which has been designed for use in the smaller sizes of single-seater aeroplanes is air-cooled, and in general design it is an advance on any previous engine of its kind.

The engine has two horizontally opposed cylinders, 5 in. bore by 5 in. stroke, the offset between their axis being 1⅛ in. This is achieved by the use of roller bearing big ends to the connecting rods, and the result is that the out of balance couple, present in all engines of this type in which the cylinders are not exactly opposed, is reduced to a very small amount.

The valves are situated in the cylinder heads, and are operated by push rods from a camshaft contained in the crankcase.

Roller or ball bearings are used throughout the engine.

Cylinder Construction.

The construction of the cylinders is that of an aluminium alloy head into which is screwed a steel liner, thus forming the complete cylinder. This design is the outcome of a long series of experiments, and as much as 30 h.p. per cylinder has been obtained and a m.e.p. of 127 lb. per square inch has been reached with a petrol consumption less than 0.6 pints per b.h.p. hour

The liner is screwed into the aluminium head under heat treatment, thus allowing the aluminium alloy to shrink and make a satisfactory joint.

The valve seatings are of bronze and are expanded into the cylinder head, after which they are machined in position.

Valve Gear.

Each cylinder is fitted with two valves which are manufactured from the very best quality steel which is procurable for this purpose. They are operated, as stated previously, by external push rods operating through horizontally placed rocker shafts.

Crankcase Unit.

The cylinders are mounted by a special device onto an aluminium crankcase, which is constructed of one unit with a front cover through which the crankshaft protrudes to carry the propeller boss. The crankcase is neat in external appearance and is mounted onto the front of the aeroplane by four bolts which are accessible from the outside.

Lubrication.

The lubricating oil is contained in the base of the crankcase and is fed to the working parts of the engine by an oil pump. There is a special adjjustment to allow the correct amount of oil being supplied from the pump so that at no time is more oil going to the working parts of the engine than is sufficient for the working.

Ignition.

The engine is fitted with one ignition only, that is, a 2-cylinder magneto of British manufacture. It is not considered necessary or desirable to fit a dual ignition to an engine of this nature, as was necessary on larger engines used during the war.

Carburation.

The incoming gases pass through an exhaust heated jacket mounted on the underside of the crankcase.

Specification.

Cylinders : 2.
Bore : 5 in.
Stroke : 5 in.
B.H.P. at 1,500 r.p.m. : 42.
B.H.P. at 1,800 r.p.m. : 50.
Petrol consumption :
3½ gallons per hour at 1,500 revs. per. min.
Oil consumption :
2¾ pints per hour at 1,500 revs. per min.
Weight dry : 135 lb.
Overall breadth : 39.5 in.
Overall height : 31.15 in.
Overall depth : 20.5 in.
Engine fixing bolts P.C. diameter : 15 in.
Price (provisional) : £250 at works, Coventry.

THE EMPLOYMENT OF METAL IN AIRCRAFT CONSTRUCTION.

It was, of course, inevitable that the development of metal in Aircraft Construction would in time lead to considerable alterations in the principles upon which aircraft are built. For instance, what may be called the "two-spar" wing with its internal bracing wires had become a set and universal type, and apparently, so long as wood remained the constructional material, it is reasonable to assume that wings constructed upon that principle would not have been departed from.

But the successful adaptation of metal to the requirements of aircraft construction has now rendered possible considerable departure from those formerly accepted lines, and one of the most noteworthy of these innovations is already to the fore in the shape of the "Mayrow-Wing."

This is an all-metal wing in the design of which the two spars as usually understood are abolished and internal wires absolutely done away with.

In the place of the usual twin spars the "Mayrow-Wing" has five longerons running parallel with the front edge of the wing and a number of transverse ribs placed obliquely from front to rear and connected with the longerons at each crossing point in such manner that the longerons and ribs together form a series of triangles. The wing can be surfaced either with fabric or metal. It is claimed that internal wires are neither necessary nor of any advantage, and therefore none are fitted.

This method of wing construction is a radical departure from the hitherto accepted principle upon which wings have been built, but providing that it can be successfully proved that the necessary strength and reliability is obtained, that point is hardly material.

It would certainly appear that a more advantageous distribution of stress is attained when it is taken up by a number of members all designed to bear a proportionate share of the load, but it does not necessarily follow that this new principle of construction would under actual flying conditions provide all the requirements successfully obtained under the "two-spar" principle of construction.

Still, the inventor and patentee of this innovation in wing building, Mr. James Mayrow, has had very considerable experience in metal construction. There are few men who have spent so long in pursuing the problem of metal construction of aircraft, and it is reasonable to suppose that a practical, as well as a technical, man, as he has proved himself to be, would launch upon the aircraft world anything that is not sound.

The Aircraft Steel Construction Company, which is the concern commercially exploiting this development of the "Mayrow-Wing," state that having lately acquired large new works at Stratford, they are now in a position to execute orders for this form of "All-Steel" wing for any type or design of plane at present flown, and are prepared to guarantee results. This latest form of metal wing is guaranteed to show a 50 per cent. greater margin of safety, weight for weight, than any twin-spar wing, whether the spars be of metal or wood.

The technical details of this wing should prove very interesting to all engaged in aircraft construction, and no doubt they will now soon be available for the investigation and consideration of all concerned.

An important result of the employment of metal as a constructional material for aircraft is the possibility of introducing complete standardisation and interchangeability of all members and parts.

The system under which the Aircraft Steel Construction Company build is designed to provide this. The problem in the case of aircraft presents many difficulties not met with in other structures. Nevertheless, the important point is that standardisation and interchangeability is really aimed at, for in no other type of machine is it of more importance and advantage than in commercial aeroplanes.

Under the most favourable flying conditions and with the best of skill and judgment small accidents, and therefore minor injuries, are almost inevitable in aviation. Consequently, the ability to replace a damaged member or part from stock is an advantage of almost incalculable value.

One point in connection with the work of the Aircraft Steel Construction Company is that they employ only specially treated steel, which they claim to be absolutely rustless. The process is a secret one, but they are prepared to submit steel treated by this process to the severest tests in the matter of rusting and oxidisation. Their own test is to place a steel member after passing through the process upon the sea shore between low and high water mark. In this manner the tide alternately submerges the metal in salt water and exposes it to the air, sun, rain and wind. If steel is to be employed in aircraft construction this question of rustlessness is of vital importance, and a steel that will sucessfully withstand a test of this severity could obviously suffer no deterioration whatever in a machine that is as carefully safeguarded and looked after as an aeroplane.

B.T.H. MAGNETOS.

When war produced a demand for magnetos, for which there was no established source of supply in the British Empire, it might have been expected that so wide awake an electrical manufacturing concern as the British Thomson-Houston Co., of Rugby, should have set itself to the problem of remedying this defect, and that B.T.H. magnetos should have established so great a reputation, even in the face of the fact that their products were markedly different to the almost universal "Bosch" of earlier times.

The B.T.H. magnetos of the A.V. type have been specially developed for aero engines and are made for either eight- or twelve-cylinder engines.

They are all of what is termed the inductor type of magneto—that is to say, that, instead of the usual type of armature winding attached to the rotating member of the magneto, and thus subject to vibration, centrifugal stresses, and the need for extreme compactness, the armature windings are wound on a fixed laminated core, and the rotating parts of the mechanism are confined to solid soft iron pole pieces whose rotation serves to direct the magnetic flux of the magnets proper through the armature core in alternating directions, to the contact breaker and to the distributor.

The advantages of the type are numerous. A much stronger construction is possible, armature slip rings and their attendant risks of leakages are avoided, and the use of a four-pole rotating inductor allows of four sparks per revolution being obtained instead of two, as with the usual form of magneto armature, and the magneto thus may operate at half the speed of rotation needed in the rotary armature type. The stationary armature coil arrangement makes it possible to use much simpler winding methods and allows of more space for insulation.

The high tension distributor is of the spark gap type, i.e., the rotating contact does not touch the distributor segments, but is separated by a short gap, and hence there are no high tension carbon brushes to wear out, stick, fill the interior of the distributor with carbon dust, or wear grooves in the distributor casing.

THE DEVELOPMENT OF TORPEDO AIRCRAFT.

Amongst those who have done good work in the development of torpedo-carrying aircraft in this country the Blackburn Aeroplane and Motor Co., Ltd., deserve some considerable mention.

Their first connection with the torpedo connection arose over the design of the G.P. (general purpose) seaplane in 1915-16. Although not purely a torpedo machine this twin-engined machine was arranged to carry a light torpedo as one of the numerous forms of armament to which it was susceptible, and with it the firm gained some experience of the fitting, carrying and dropping gear necessary to this class of work.

When the Sopwith "Cuckoo" was produced, and had been tested and found satisfactory as far as the aeroplane part was concerned, it was decided that the work of putting it onto a production basis should be put into the hands of a firm conversant with the essential torpedo problems, and the work was therefore entrusted to the Blackburn firm, who with the assistance of experts from the R.N.A.S. carried out much work in connection with the torpedo-dropping and aiming gear, the silencing of the engine exhaust, and the fitting of warming gear to prevent freezing-up of the air passages in the torpedo itself—a phenomenon which occurred frequently at high altitudes and which effectively demoralised the torpedo by preventing the torpedo engine functioning.

The problems of the "Cuckoo" being satisfactorily solved and the final pattern in production, Blackburns were asked to design a machine to carry a still heavier torpedo and at a higher speed and with a greater climb than the "Cuckoo."

These two requirements were met in the "Blackburd," though necessarily at the cost of some sacrifice of the manœuvrability which distinguished the "Cuckoo."

This machine represented a very difficult problem. A very large load had to be carried, and as it was to fly from the deck of a seaplane-carrier special measures had to be adopted to secure a quick get off. This was met by the use of trailing edge wing flaps giving the effect of a high lift wing when pulled down. The machine had to be fitted with emergency flotation gear of the "Port Victoria" type, which involved arrangements for releasing the wheels before alighting, and also before dropping the torpedo.

The control problem, with wing flaps, wheel release, torpedo release, air bag inflation gears, and so on, was a very complicated one, and required much ingenuity, but a practically fool-proof interlocked control gear which made it impossible for operations to be carried out incorrectly was devised, which greatly simplified the controls.

At the time of the Armistice a further torpedo-carrier, the "Kingfisher," was in course of design which incorporated many new features. The advent of peace has delayed progress on the "Kingfisher," but the firm have not abandoned the work, as they are confident that this type of machine has a very great future for war purposes.

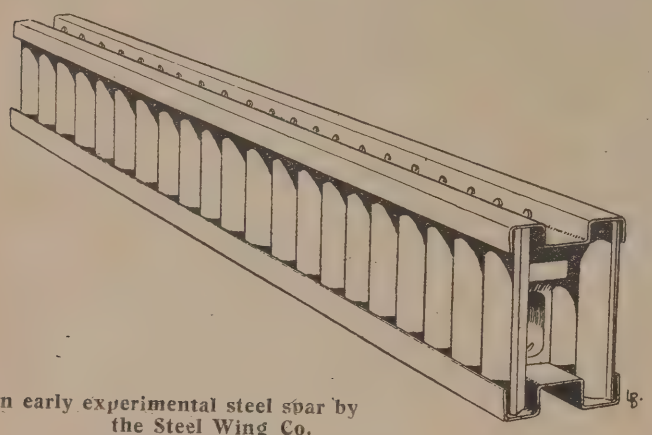
WORKS: HIGH STREET, MERTON, AND HENDON.



THE STEEL WING CO., LTD.

With the advent of peace and the possibilities of using aircratf for exploratory and development work in the less frequented parts of the earth, the importance of climate-proof aeroplanes assumes a new interest.

It might seem reasonable to assume that a form of construction capable of withstanding the rigours of the British climate would survive that of any other part of the habitable globe, and with the exception of a few particularly difficult—in the climatic sense—localities, this is largely true—so far as purely meteorological variations are concerned.

On the other hand, those countries whose human population is sparse usually abound in other forms of life—forms usually classed as lower but often possessed of a destructive capacity far in excess of that of the average human.

White ants, for instance, could reduce a timber-built aeroplane to produce with a speed and efficiency which would make any Government Salvage Department look silly, and, therefore, for climates where such destructive pests are indigenous, some more resistant structural material has its advantages.

An early experimental steel spar by the Steel Wing Co.

Apart, however, from such special local conditions, metal construction for aircraft has numerous and obvious advantages—provided that no handicap of weight or of deficient strength is thereby involved.

The difficulties of using metal as a substitute for timber in aeroplane structure are entirely manufacturing difficulties, and they have been very great.

Nevertheless, they have been successfully overcome by several English constructors, and amongst them by the Steel Wing Co., Ltd., who have been engaged in experimental work exclusively directed to this end for several years.

The essence of their solution of all the difficulties is the use of members constructed from thin steel strip, into which longitudinal corrugations are rolled or pressed, these corrugations having the effect of giving to the material that resistance to local stresses which is deficient in the original flat strip.

The result of their work is that the firm is now in a position to manufacture all-steel wings for any normal type of aeroplane, which shall weigh no more, and shall have a materially greater strength than wings of the usual timber type.

SAMUEL OSBORN AND CO., LTD.

Samuel Osborn and Co., Ltd., of the Clyde Steelworks, Sheffield, have been manufacturing alloy steels since the year 1871, when they acquired the sole right to manufacture "Mushet" self-hardening steel. Since then they have been making alloy steels under very special conditions and have developed this manufacture extensively.

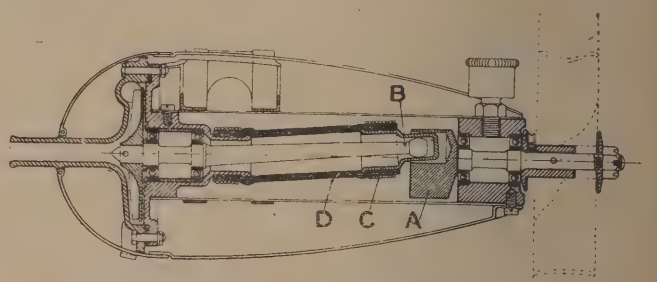
They are now in a position to supply steels of the highest excellence for the special requirements of aircraft manufacturers. These special quality steels are manufactured under the supervision of a trained metallurgical staff, and give not only the usual static tests (tensile strength, etc.) required to meet the demands of aircraft construction, but also the more important resistance to shock, and endurance of "fatigue."

Their electric alloy steel gives the highest possible impact value and should be used for all parts where high impact resistance is necessary.

They will at any time be pleased to give purchasers and users any information concerning the heat treatment of their steels, their assistance in the choice of the most suitable steels, and the benefit of their experience in the endeavour to remove any difficulties encountered.

All steels bear the well-known "Hand and Heart" trade mark, and Messrs. Osborn recommend their C.H. brand (case-hardening) steel, their S.C.H. brand (special case-hardening) steel, and their E.S.C. brand (extra special case-hardening) steel, for gears and stamped parts. Where parts require a glass-hard surface with a strong core, capable of withstanding vibratory shocks, the S.N.C.H. brand (special nickel case-hardening) steel, and the H.N.C.H. (high nickel case-hardening) steel is recommended

Their rustless steel is suitable for valves and all purposes where it is desirable to avoid rust. N.C.C. and N.C.7 brand (nickel chrome case-hardening) steels are recommended for parts which have to withstand the severest shocks.



An ideal steel for R.A.F. "Specification 5.B" is their N.C.A.H. brand (nickel chrome air-hardening) gear steel; and M.T.R. (nickel chrome oil-hardening) steel will be found to give excellent results in tensile strength, elastic limit, extension and contraction, and is absolutely one of the finest alloy steels produced.

Aircraft manufacturers will also find that Osborn's "Mushet" high speed steel milling cutters and twist drills, and Mushet's special steel for turning tools, will give the utmost satisfaction.

THE AUSTIN "GLANDLESS" PETROL PUMP.

This type of centrifugal petrol pump has been thoroughly tested, and is now officially approved for use in aeroplanes supplied to the Air Ministry.

The "Glandless" pump, as will be seen from the illustration, consists of a propellor-driven crank "A" running in ball-bearings, which operates a short stroke crankpin "B," machined as a part of the impeller spindle of the pump itself. Interposed between the crank disc and the crankpin is a special metal thimble "C," which is connected directly to the neck of the pump body by means of a piece of standard petrol-resisting rubber hose "D."

The thimble "C" therefore only oscillates round a circular path, the crank disc revolving outside it and the crankpin inside it.

By this arrangement, provided all joints and connections are tight, there is no danger of petrol leakage, and the loss due to friction is reduced to a minimum. In ordinary use the petrol-resisting rubber hose lasts a considerable time, and, moreover, can be easily renewed by a standard piece of petrol-resisting rubber hose joint.

The "Glandless" pump is manufactured by the Austin Motors Ltd.

"CELLON DOPE."

During the last few months, as could only be expected, there has been very little doing in the aeronautical industry, but the policy of resting on the laurels gained through sheer hard work does not commend itself to Cellon, Ltd. Although very little is heard anent the work being done, it is comforting to know that experimentation is being carried out.

Cellon, Ltd., have been conducting quite a lot of experimental and research work on improvements in dope, with the result that in addition to their ordinary schemes for doping they are now in a position to supply a scheme in which the pigmented covering is entirely abolished, and the whole doping comprises only four coats. This scheme has been used by one or two firms on experimental machines, and they have expressed great satisfaction with it. It is prepared in all colours, thus giving firms a variety of shades in which they can finish their machines.

During the last few months consignments of "Cellon" have left this country for Holland, Spain, Norway, Argentine, Chili, Japan, Australia, and India.

As regards their post-war work it is interesting to see that Cellop Dope has so far been used on the Sopwith, Martinsyde and Boulton and Paul machines destined for the trans-Atlantic flight; on the Sopwith, Supermarine and Fairey machines, representing the British team in the "Schneider Cup" contest, and on the Sopwith, Martinsyde and Blackburn machines at present entered for the Australian flight.

It may be interesting to recall that in 1912 every important competition in this country was won on machines doped with "Cellon."

EDGAR ALLEN AND CO., LTD.

The steel maker's art (as practised by Edgar Allen and Co., Ltd.) is a true revolution. The ever-growing demand for new perfections and new varieties made by engineering problems has brought forth a succession of types. The pioneers of motor-car construction, in particular, called into being a whole series of alloy steels, conforming to new standards of resistance.

Similarly, in aircraft, the demand for steels of greater strength and tenacity necessitates a large amount of experimental and research work. Specialisation in steel, as worked out on scientific lines in the Allen Research Laboratories, has produced the liberal variety of Allen Steels, each with its special uses.

The dire necessities of war called for enormous quantities of special alloy steels for aircraft use which had not only to be up to standard in mechanical tests but also thoroughly reliable in use. The steel maker was supplied with what, at the time, were impossible specifications, and it was only by the scientific work carried on in the laboratories that not only was material made to conform to these specifications, but the manufacturers were enabled to produce even better results than asked for. Again, scientific steel-making for war-work and other purposes must leave nothing to chance.

At the Imperial Steel Works, Sheffield, Edgar Allen and Co., Ltd., exercise the strictest care throughout the manufacturing process. In some of the most useful alloy steels, surface flaws and blemishes are likely to form in the early stages of their manufacture. If they were not eradicated at the works, it is easy to see that finished steels might prove unreliable, and cause waste and trouble which no amount of laboratory work could prevent. Edgar Allen and Co., Ltd., treat their steels right through the manufacture in every possible way so as to eliminate all flaws, etc.

Each grade of steel is capable of playing many parts, much depending on treatments. The steel is first quenched at a fairly high temperature, and afterwards reheated to a specified low temperature, and then allowed to cool. On the thermal degree to which this reheating is carried depends the final characteristics of the steel.

A high reheating gives low tensile strength but greater toughness, and a low reheating greater strength, with some loss of toughness. Alloy steels are highly susceptible to such treatments, and by suitable variations can be made to acquire a remarkable variety of characters. This places at the disposal of the user a corresponding rich selection of steels made from one original material.

Edgar Allen and Co., Ltd., have produced amongst a number of extremely useful handbooks one that deals with the varieties of alloy steels suitable for aero- and motor-car engines. The correct Allen steel for every motor-car and aeroplane part is specified with the official and other accepted standards to which it conforms.

In addition to this handbook, which, with its charts and tables, is, in itself, of extreme practical use, the Edgar Allen Research service has been established, which is for the assistance of all steel users. They are willing to investigate the cause of difficulties connected with specimens submitted to them, and, if necessary, an expert demonstrator will be sent to assist in obtaining correct results. This service is placed freely at the disposal of engineers and constructors, and no fee is charged for research and advice.

A NEW AERIAL ROUTE MARKING DEVICE.

A new method of route indicating, which may become of immense importance to commercial aviation is at present being developed and tested in France.

It depends on the well-known fact that a conductor carrying an alternating electric current will induce in another conductor parallel to it a current alternating at the same frequency. The intensity of the current so induced becomes rapidly less as the distance between the two is increased, but with modern detecting appliances it is possible to transmit signals over several miles.

Taking advantage of this fact, it is proposed to delineate aerial routes by laying along each wires conveying alternating currents of definite frequencies which will be particular to each route, and to equip aircraft with a telephonic receiving set, which can be made to be directive by very simple means. An aircraft has then merely to pick up on its receiver the note proper to its desired route, and keep the sending wire of that note beneath it.

Aerodromes will be looped round by such a cable, so that in a fog a pilot would find himself flying round in a loop if he followed the note accurately, and will thus receive a signal which should enable him to land therein.

It is said that tests made with a cable laid in the tortuous entry to a difficult harbour have shown that it is possible to navigate a ship accurately by this means, and the value of such an arrangement for cross-country flying in bad weather should prove immense.—J. S.

TITANINE, LTD.

Among the recent developments of Titanine, Ltd., is the production of a material which is known as "Titanine Adhesive and Varnish," and which, it is hoped, will overcome part of the difficulties that have arisen from leakages to fabric-ed seaplane floats. The adhesive does not soften from heat, and is waterproof.

Certain people in finishing off seaplane floats have been known to apply the ordinary paint direct on to the canvas, which invariably results in rotting it, owing to most paints containing oil.

The "Titanine Adhesive and Varnish" is used as an adhesive to apply the canvas to the float, and also as a varnish after the fabric has been applied, thereby isolating the paint that is afterwards put on as an outside protective covering, and prevents any likelihood of leakage or of rapid deterioration.

In addition to the above product, Titanine, Ltd., also produce the following manufactures, all of which are well-tried and up to the standard claimed and required :—

"Titanine" Aeroplane Dope, "Planoline" fireproofing solution for use on fabric prior to doping, transparent and pigmented oil varnishes, Nitro pigmented finishing varnishes in all colours (suitable for commercial aviation), seaplane float paint, etc., etc.

BRUNTONS, LTD.

Bruntons, Ltd., of Musselburgh, the well-known manufacturers of all classes of high-grade steel-wire, wire rope, springs, and a host of other articles, as well as cold-drawn steel for all purposes, claim to be the first firm in Great Britain to produce tie-rods for use in aircraft.

As long ago as 1907 they supplied steel tie-rods to the British Government for use in construction of airships and aeroplanes, and have supplied wire and wire ropes for use with aircraft from very early times.

With the adoption of streamline tie-rods, more commonly called Rafwire, as standard bracing for practically every type of British aeroplane, Bruntons, Ltd., have enlarged their plant, until, at present, they are capable of producing larger tie-rods than any yet used in aircraft construction.

They now have a special factory equipped for the manufacture of tie-rods of various sections, together with all kinds of fitments, such as end fittings, fork ends of divers patterns, locking plates, turnbuckles, etc., and also steel wire, piano wire, and steel wire cables, of every necessary weight and strength.

Realising the necessity to combat rust and other corrosive evils in aircraft wiring, Bruntons, Ltd., have introduced a new method of depositing a thin zinc coating to wires and rods known as "Bruntonising." It is superior to the ordinary hot galvanising process in two main respects : first, the coating is quite smooth and bright, which not only gives it a better appearance but makes it adhere more firmly to the wire; secondly, the process has no deleterious effect on the physical properties of the wire, as hot galvanising has.

This process has been approved by the British Government as the most efficient protection from atmospheric corrosion that has yet been devised. They also have special plant for electro aglvanising, Cosletising and enamel spraying all wires and fittings.

BRITISH MAGNETOS.

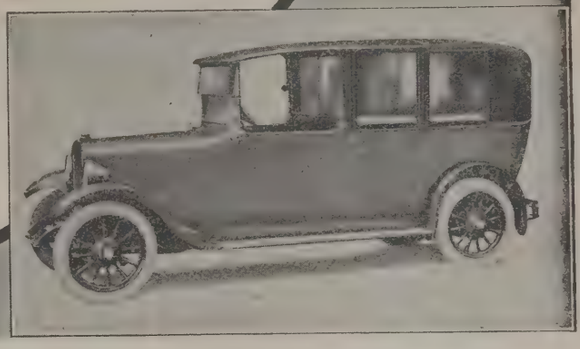
Prior to the war it was the general idea that Germans were the only people who were capable of making reliable magnetos, and the name of Bosch was to be found on nearly every spark-producer in use on British cars and aero engines.

It was not until the war started that we had to settle down to the problem of making our own magnetos, and as the internal combustion engine was to play such an important part in all spheres of the fighting it is to the credit of the few firms who took upon themselves the task of creating and building up the British magneto industry that we succeeded in beating Germany in the air, on land and sea and under the sea.

An interesting handbook has been issued by the British Ignition Apparatus Association, of 8, Bream's Buildings, London, E.C.4, which has been produced in the interests of the British L.M. Ericcson Mfg. Co., Ltd., of Beeston, Notts, the British Thompson-Houston Co., Ltd., of Coventry, the E.I.C. Magnetos, Ltd , of Birmingham, the M.L. Magneto Syndicate, Ltd., of Coventry, North and Sons, Ltd., of Watford, the Thompson-Bennett Magnetos, Ltd., of Birmingham, and C. A. Vandervell and Co., Ltd., of Acton, W.3.

This booklet gives particulars of standardised British magnetos made to dimensions which permit of interchange and quick replacement of parts produced by the British firms mentioned above, who have helped to achieve success for Great Britain, and, at the same time, gained experience which guarantees satisfaction for the user.

A copy of this handbook will be sent to anyone who applies to the Publicity Department, British Magnetos, 8, Bream's Buildings, London, E.C.4.



What flying has taught us—

The demand of the aeroplane for the utmost power from the lightest and most trustworthy engine, and our concentration on that problem, has taught us much—and each owner of the new Austin "Twenty" will benefit thereby.
More power with less weight and greater reliability combined with silent running, flexibility and marked economy are characteristics of the new Austin "Twenty" and assure its selection by discriminating motorists.

The new **Austin** *"Twenty"*

18 NEW RECORDS

On Nov. 22nd, Capt. Gathergood, piloting a 450 h.p Napier Engined Airco 9R machine, secured the following 18 Official British Records :—

Longest distances in ¼ hour, ½ hour, 1 hour and 2 hours.

Greatest speed over straight flight of 5 Kilometres.

Greatest speed in closed circuit for 5, 10, 20, 30, 40, 50, 100, 150, 200, 250, 350, and 400 Kilometres —without alighting.

C. C. WAKEFIELD & CO., LTD.,
Wakefield House, Cheapside, London E.C.2.
and 21, Rue du Mont Thabor, Paris.

TRIPLEX SAFETY GLASS AT THE PARIS AERO SHOW.

As might be expected, "Triplex" Safety Glass will be represented in all its forms at the Paris Salon d'Aeronautique, both by the British Triplex Safety Glass Co., Ltd., and by the Société due Verre Triplex, of 17, Rue Desnouettes, Paris. In addition to an exhibit at Stand 4, Gallery C, where there will be a large selection of aeroplane wind-screens and windows, goggles, map cases, etc., practically all the flying machines exhibited will be fitted with Triplex Safety Glass wind-screens and windows.

There was, perhaps, no article used in aircraft during the war that was so consistently successful, and the fact that it is now being almost universally employed on all aircraft, motor-cars, etc., for wind-screens, windows, goggles, etc., is sufficient to prove that the qualities claimed for it are fully justified.

By a revolutionary method of making glass permanently and definitely unsplinterable, even under the heaviest blow or concussion, absolute safety and practically everlasting durability is ensured, many insurance firms even going so far as to make a considerable rebate on premiums charged on vehicles where Triplex glass is used, which is in itself one of its highest recommendations.

SWIFT, LEVICK AND CO.

Swift, Levick and Co., Ltd., who were known previous to the war as one of the largest manufacturers of special high-speed, nickel, cast, and electrically smelted alloy steels, have, since the commencement of the war, been one of the largest makers of all classes of electrically smelted alloy steel used in the manufacture of aeroplanes, aero engines and accessories. Among their specialities may be mentioned compass needles, permanent steel magnets for magnetos, and special armour-piercing bullet steel for use in aerial machine guns.

They claim to have been the largest British makers of all classes of compass needles, and turned out huge numbers of these for use in British and Allied aeroplane compasses. They also claim that they were the original British manufacturers of permanent steel magnets, and a very large percentage of the British aeroplanes, airships, etc., were run on magnetos using their steel magnets.

This particular part of their business has not fallen off since the war, and at present they are busy meeting the enormous demands put upon them by the motor-car industry. This remark also applies to all their grades of alloy steels, and they are turning out very large quantities for the construction of gear-boxes, driving-shafts, axles, etc., for the leading manufacturers of British motor-cars.

The experience gained by them during the war in manufacturing various grades of steel for employment in aircraft work has been of great assistance not only to them but the British industry at large, and accounts for the huge demands of the motor industry for their products. An interesting production, which naturally died with the cessation of hostilities, was the manufacture of a special armour-piercing bullet steel which was used largely by the Air Services during the latter part of the war.

HERBERT TERRY AND SONS.

It would certainly be interesting to know the limits to which a firm would put itself in the case of national emergency, in order to turn out articles of immediate use. This has been fairly well demonstrated in the late war, when firms accustomed to turn out articles of domestic necessity did not hesitate to build, according to the type of machinery available in their factories, anything from a tank to a split-pin. Herbert Terry and Sons, Ltd., of Redditch, who, before the war, were famous for the manuacfture of springs of all kinds, turned their attention to and turned out huge quantities of small parts such as springs, all kinds of press work, wire work, flexible shafting, cable controls, hose clips, etc., etc., and, incidentally, gained a reputation for producing everything of the highest grade, this reputation having as its outstanding feature the fact that the Sunbeam-Coatalen "Maori" engines fitted in the "R.34" in its memorable flight across the Atlantic and back had "Terry" valve springs throughout.

PETROL PRICES.

The present current prices of the products of the Anglo-American Oil Co., Ltd., are as follow:—Pratt's "Perfection" Spirit, 3s. 0½d. per gallon; Pratt's Aviation Spirit, 3s. 4½d.; "Taxibus" Spirit for heavy commercial vehicles, 2s. 10½d.

CASTROL AND RECORDS.

In connection with the 18 records made on Nov. 15th by Capt. Gathergood on an Airco D.H.9R. (450 h.p. Napier aero engine) it is interesting to note that Wakefield's "Castrol" was used as the lubricant and was responsible for the sweet and uninterrupted functioning of the engine, a task for which it is eminently suited, as has been proved in the past.

HALL AND PICKLES, LTD.

Hall and Pickles, Ltd., have just issued a descriptive booklet in which the different qualities of Tool Steels that they manufacture are enumerated together with the uses for which each is particularly suited. In addition, a few simple instructions for heat treatment and other particulars which may be of service to users of crucible steel are given.

Their high-speed qualities are sold under the registered corporate mark of "Hydra" and are steels of the finest quality, the result of the latest metallurgical research and practical experience, designed to meet the highest demands in machine-shop practice.

High-speed steel is a product indispensable amongst all users of tool steel. Since the time of its inception in the year 1900, when practical demonstrations were given at the Paris Exhibition, the development of this wonderful commodity has resulted in a remarkable revolution in machine-shop practice throughout the world.

In spite of the great care taken in the selection of materials of highest quality together with the employment of highly-skilled labour and extensive laboratory work, it is impossible to produce high grade high-speed steel which is entirely proof against injury when in the hands of the customer. The successful treatment of high-speed steel requires experience, care, and a high degree of skill, careful pre-heating and an intelligent forging so that a good heat is maintained during the operation.

The ultimate success of any high-speed steel tool depends entirely upon the amount of heat received in hardening and the way in which the heat has been applied.

In a similar way Carbon Cast Steel depends on the grade of iron used together with the applied skill of the steel melter and greater care is necessary in dealing with carbon steel, because most carbon steels have but a limited range of treatment, being much more sensitive and easily ruined in forging and hardening.

It is to this end that Hall and Pickles, Ltd., issue this handbook together with comprehensive instructions which are supplied with each brand of their steel, which, if carefully followed, cannot do other than produce the best possible results. In addition, to further assist their clients they have on their staff a highly-skilled high-speed steel expert, who is, at all times, willing to collaborate with anyone who is in difficulties regarding hardening and tempering their steels.

ANOTHER BROWN PRODUCT.

Brown Bros., Ltd., always to the fore where the comfort and convenience of aviators and motorists is concerned, have just put upon the market a very handy little file which is known officially as the "Spark" ignition file. It is sufficiently thin to get between the points of a sparking plug without separating them so far as to produce any danger of breaking the points in getting them back to the correct gap. In fact, the file itself is so thin that it can practically be used as a gap gauge for sparking plugs.

It is made specially for the job, and so, instead of having the usual sharp pointed tang, the steel rod from which the file is swaged is left in its original round shape and thus forms a convenient handle. The price of the file is 1s., which, in these days, is really remarkably cheap.

CORRECT LUBRICATION.

"Correct Lubrication," a 60-page booklet issued by the Vacuum Oil Co., Ltd., is considerably more than a mere statement of the excellence of Gargoyle Mobiloils. It is a real help to motorists, explaining in clear language the imperativeness of scientific lubrication and emphasising the reward of this practice—economy of repairs, of depreciation, and of fuel and oil. Engine and chassis troubles are delineated and their remedies stated, and a lengthy chart, embracing most types of motors, passenger and commercial, British and imported, shows the exact grade of "Mobiloil" to be used on each. Any one who reads this booklet—an act that involves no mental discomfiture—will gain an extension of knowledge that cannot fail to prove profitable.

AN EXPERIMENTAL VACANCY.

There is a vacancy in one of the few aircraft works now seriously engaged on experimental work for a technical assistant. Applicants for the post must have a thorough knowledge of the mathematics necessary for aerodynamic and stress calculations, and should preferably have held a similar position before. Draughtsmen, tracers and so forth are not required, but a thoroughly experienced person of the kind usually described in aircraft factories as an "x-chaser" or "stress-merchant."

Applications should be addressed in writing to "X," c/o The Aeroplane, 175, Piccadilly, W.1.

NAVAL & MILITARY AERONAUTICS

[The official "Gazettes" and Personal Notices will be found on page 2124.]

GREAT BRITAIN.

FROM THE "COURT CIRCULAR."

BUCKINGHAM PALACE, Dec. 16th.

The Right Hon. Winston Spencer-Churchill, M.P. (Secretary of State for War and Air), had an audience of the King this morning.

BUCKINGHAM PALACE, Dec. 17th.

The King held an Investiture in the Ball Room of the Palace at 11 o'clock.

The following were severally introduced into the presence of the King, when His Majesty invested them with the Insignia of the respective Divisions of the Orders into which they have been admitted :—

THE MOST HONOURABLE ORDER OF THE BATH (MILITARY DIVISION).—Companion.—Air Vice-Marshal John Higgins (also received the Air Force Cross).

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE.—Officer.—Military Division.—Sqdn. Ldr. Frederick Unwin, R.A.F.

Member.—Sec. Lt. John Knight, R.A.F.

The King then conferred decorations as follows :—

THE DISTINGUISHED SERVICE CROSS.—Lt.-Col. Osborne Butcher, R.A.F.

THE MILITARY CROSS.—Capt. Evan Pybus, R.A.F.; Flying Officer Richard Bentley, R.A.F.

BUCKINGHAM PALACE, Dec. 18th.

The Marquis of Londonderry was received in audience by the King this morning, when His Majesty invested him with the Insignia of a Knight of the Most Noble Order of the Garter.

His Majesty held an Investiture in the Ball Room of the Palace at 11 o'clock.

The following were severally introduced into the presence of His Majesty, when the King invested them with the Insignia of the respective Divisions of the Orders into which they have been admitted :—

THE DISTINGUISHED SERVICE ORDER AND THE MILITARY CROSS AND BAR.—Flight Lt. Geoffrey Bowman, R.A.F. (also received the Distinguished Flying Cross).

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE.—Member.—Military Division.—Capt. John Walker, R.A.F.

His Majesty then conferred decorations as follows :—

THE DISTINGUISHED FLYING CROSS AND BAR.—Maj. John Morrison, R.A.F.

THE DISTINGUISHED FLYING CROSS.—Flight Lt. Arthur Randell, R.A.F.; Lt. John Bacon, R.A.F.; Flying Officer Cecil Bouchier, R.A.F.; Lt. Edward Wheatley, R.A.F.; and Sec. Lt. John Brown, R.A.F.

THE AIR FORCE CROSS.—Sqdn. Ldr. Maurice Wright, R.A.F.; Capt. Thomas Hayes, R.A.F.; and Capt. Harry Robins, R.A.F.

NAVAL.

ADMIRALTY APPOINTMENTS.

The following appointments and promotion have been made :—

PROMOTION.—Lieut.—C. J. L'Estrange-Malone, M.P., to rank of Lt.-Comdr., seny. Dec. 15th.

Dec. 20th.—Surg. Lieut.—N. B. de M. Greenstreet, to "Royal Ark."

The R.N.A.S. at Dunkirk.

It is stated in the order issued by the Admiralty on Dec. 17th that service with the R.N.A.S. at Dunkirk, August 4th, 1914, to midnight, Nov. 22nd-23rd, 1914, does not qualify for the clasp to the 1914 Star.

MILITARY.

WAR OFFICE, Dec. 15th, 1919

The Secretary of State for War has received three dispatches from General Sir Reginald Wingate, G.C.B., G.C.V.O., G.B.E., K.C.M.G., D.S.O., on the military operations in the Hedjaz from June 9th, 1916, to Jan. 31st, 1919, from which the following extracts are taken :—

Dispatch No. 1, from Cairo, dated June 25th, 1917 :—

"When the Arab campaign opened on June 9th, 1916, the Turks were to great extent taken by surprise . . ."

"Early in October, although the pilgrimage had been carried out without hindrance, the situation in the Hedjaz had become a serious one, and the threatened [Turkish] advance from Medina *via* Rabegh to Mecca appeared to have a considerable chance of success. . . ."

"On Oct. 30th, 1916, incidentally the day after the Sherif had declared himself King, approval was given for the dispatch to Rabegh of a flight of aeroplanes, which it was hoped would prove of much value in the operations impending. The flight was dispatched to Rabegh early in November. . . ."

It was then decided that the only way of removing the threat against Mecca and securing the fall of Medina was to undertake raiding tactics against the railway and the enemy's lines of communications, from the North.

"The large consignments of supplies and munitions which it has been necessary to send to the Hedjaz have been almost entirely supplied by the Egyptian Expeditionary Force, and the Commander-in-Chief has also furnished most valuable assistance in the form of a Flight of the Royal Flying Corps, an Armoured Car Section, and other details. . . ."

In his recommendations at the end of this dispatch Sir Reginald Wingate says :—

"The Royal Flying Corps Flight, under the command of Major Ross, D.S.O., has more than maintained the traditions of the Corps. Exceptional difficulties of climate and terrain have been encountered and surmounted in circumstances of peculiar hardship, valuable reconnaissance work has been carried out, and the support, both moral and actual, which the Flight has given to the Arab Forces is incalculable. In this connection I am greatly indebted to Brigadier-General W. G. H. Salmond, Commanding the Middle East Brigade, Royal Flying Corps, for his unfailing help. . ."

Dispatch No. 2, from Ramleh, dated June 15th, 1918 :—

"Towards the end of July, owing to the severe strain on both pilots and machines, of continuous operations under conditions obtaining in Arabia during the intense heat of the summer months, it became necessary to withdraw the Royal Flying Corps detachment from the interior to refit at Weih, and a month later the unit returned to Egypt after nine months of exceptionally arduous and valuable service in the Hedjaz. . . ."

"Early in November the last Turkish aeroplane remaining in Medina was brought down with rifle fire by the Arabs near Bir Nasif. The wrecked machine was, in fact, subsequently recovered by the enemy and returned by rail to Medina, but since that date no further aerial activity has been shown by the Turks south of Maan. . . ."

Dispatch No. 3, from Cairo, dated Dec. 27th, 1918 :—

"At the date of my last dispatch of June 15th the isolation of the enemy's Second Composite and Hedjaz Expeditionary Forces had been effected. . . . Since then the Turkish garrisons in the Southern Hedjaz, including that of Medina, were entirely cut off from communication with the outside world, with the exception of a single aeroplane dispatch, which reached Tebuk from the north about the middle of August. . . ."

The Punjab Rioting.

Before Lord Hunter's Commission, which is inquiring into the measures taken to repress the rioting in the Punjab last April, Lieut.-Col. Frank Johnson, D.S.O., who was in command in the Lahore civil district, gave evidence in respect to the numerous orders he issued, which have been the subject of strong criticism in the Indian Press. "There was much excitement at Lahore, and in the evening a crowd of some 6,000 people advanced to the telegraph office. The police had to fire to induce the crowd to return. The state of the city was such that no white man could enter it. The police had to evacuate it, and it was given over to the mob. On April 12th he was told to enter the city. He was supported by four aeroplanes. He previously made arrangements for two of the machines to fly as low as possible, and the pilots were instructed that if they received a pre-arranged signal they were to drop bombs 100 yards away from the head of his column."

The Afghan War.

The following telegram from India dated Dec. 15th has been received in London :—

On Dec. 10th the frontier constabulary at Gumatti, eight miles north of Bannu, were fired on by a gang which was successfully bombed and dispersed by aeroplanes.

Trouble on the Euphrates.

A semi-official statement issued on Dec. 19th says :—

The latest news from Deir-ez-Zor, on the Euphrates, is that the Arab forces are still in occupation of the town. Aeroplanes sent to reconnoitre the place were heavily fired on.

AIR FORCE.

An Echo of Loch Doon.

Mrs. Charlotte Tilke McAdam, of Craigengillan, Ayrshire, has raised an action to have it declared that the whole operation of the War Department in taking possession of her estate of Craigengillan in connection with the construction of the Loch Doon Aerodrome was unwarranted and illegal. Mrs. McAdam is claiming £150,000 compensation for damage done to the estate, where she states several picturesque spots have been destroyed.

Craigengillan is of considerable extent, and includes a portion of Loch Doon, where, in 1916, the War Department decided to establish a large school of aerial gunnery.

The Department, the plaintiff says, had no authority to carry out the undertaking, and the scheme was not designed to meet any emergency, but to provide a school mainly intended for use after the war. The Department professed to act under the Defence of the Realm Act, but this, she maintained, did not apply to this undertaking and conferred no warrant for the invasion of her property. The plaintiff also refers to the operations undertaken at Bogton and Bogton Loch, where she says £60,000 to £80,000 was spent, and the place was never used as an aerodrome.

The Lord Advocate, in defence for the War Department, states that in taking possession of the plaintiff's property they acted strictly under the Defence of the Realm Acts and Regulations, and of the prerogative rights of the Crown. The establishment of the gunnery school was necessary, and its future would have depended on the course of the war. Its abandonment was due to physical conditions which had not been anticipated by those advising the War Department.

After considering other sites the General Officer Commanding the Royal Flying Corps selected Loch Doon as best suited to his needs. The difficulties due to the boggy nature of the ground and those due to rocks were fully considered, and it was part of the scheme to drain the bog and to raise the level of the Loch. Owing to certain difficulties the original plans were in part departed from as the work proceeded, and the need of taking Craigengillan House arose later. It was with great reluctance that it was taken.

Lord Blackburn, before whom the action was raised, has, of consent, stayed procedure in the case meantime.

The First R.A.F. Cadets.

The following are declared by the Civil Service Commissioners to be the successful candidates at the competitive examination held in November, 1919, for Cadetships at the Royal Air Force Cadet College; but their admission is conditional on their having passed the medical examination. A table of marks will be sent to each candidate as soon as possible.

	Marks.
*Mills, George Holroyd	9908
Buttar, Charles Philip	9295
*Henslowe, Francis Arthur	9108
Huxham, George Herbert	9098

Cooke, Desmond Aubrey Robert Bancroft	4938
Springfield, Cecil Montague Oakes Osborn	4909
*Lacey, Ernest Vair Sleigh	4807
Watts, George Edward	4776

* These candidates have received 400 marks for military efficiency.

A Territorial Air Force.

It is reported that there is a movement on foot in Leeds to form a small voluntary reserve force in connection with the R.A.F. The Blackburn Aeroplane and Motor Co., Ltd., have offered their aerodrome at Brough for training facilities, and it is hoped that the aerodromes at Tadcaster and Sherburn can also be used.

The Traditions of the R.A.F.

The Chartered Accountants' Students' Society held their annual dinner in the Connaught Rooms under the presidency of Sir William Plender on Dec. 17th. Air Marshal Sir Hugh Trenchard was among the guests.

In responding for the Imperial Services, Sir Hugh said that many traditions had been built up during the war, and among them the air spirit had proved itself equal to the older spirit of the Navy and Army. As an example of this, he mentioned that when Mannheim was bombed by half a squadron of the Air Force and only one machine returned, the remainder of the squadron went up without orders and turned what at first looked like failure into a glorious victory. While the older Services looked to age to build up their traditions, the Air Service looked to youth. Great as was the necessity for economy in these days, the necessity for maintaining our naval, military, and aerial supremacy was still greater.

R.A.F. Rugby Football.

The R.A.F. played Swansea at Swansea on Saturday, Dec. 13th, with the following result :—

R. A. F., 2 goals, 10 points; Swansea, 1 dropped goal, 1 penalty goal, 1 try, 10 points.

This match at Swansea was played in a downpour of rain, which was fortunate for the R.A.F., as the ball was very slippery and extremely difficult to hold, and as the Swansea backs had the ball very frequently. The R.A.F. forwards played a capital game, and Damant, at full back, played his soundest game this season. Swansea were the first to score by means of a penalty goal, but shortly before half-time McLennan picked up and scored a well-deserved try near the corner flag, which Dalziell converted brilliantly. No further score happened before half-time. R.A.F., 5 points; Swansea, 3 points.

In the second half Swansea got a drop goal and another try, while Maxwell dashed over for the R.A.F. and Dalziell converted. Swansea battered away at the R.A.F. line but could not penetrate the defence, and so the game ended in a draw of 10 points each. Considering that over half the team had not played together before, and as it was the first game this season for at least five weeks, it was a very creditable performance.

The R.A.F. Team :—Full back, Flying Officer Damant; three-quarter backs, Squadron Leader Penny, Flying Officer Churchman, Flight Lieut. Scott, Flying Officer McLennan; half backs, Flying Officer Dalziell, Flight Officer Massey; forwards, Wing Commander Breese, Flight Lieut. Scroggs, Flight Lieut. Simpson, Flight Lieut. Usher, Flight Lieut. Cripps, Flight Lieut. Gray, Flight Lieut. Whitworth, Flying Officer Maxwell.

BRAZIL.

A Coming Visit.

The Brazilian Government have selected the Brazilian aviators, Señors Alzir Rodricues and Bento Ribeiro to proceed on a visit to England and the United States in order to view aviation works.

A Purchase.

It is understood that the Brazilian Government have bought 30 aeroplanes for the Brazilian army from France.

POLAND.

One is indebted to the "Daily Mail" of Dec. 9th for the following story :—

The first two British officers to be given commissions in the Polish Army are Lieut. J. F. D. Tanqueray, D.F.C., and Lieut. L. S. Woodhouse, Croix de Guerre. Both were in the Royal Flying Corps during the war.

Interviewed by a "Daily Mail" reporter yesterday, Rear-Admiral V. Kloczkowski, Naval and Military Attaché to the Polish Legation, said he believed Lieuts. Tanqueray and Woodhouse are at present in Warsaw; their services would be employed with the Polish Flying Corps. Over 100 applications had been received, many from officers with very distinguished war records on the Western front. Only 25 commissions will be given to British officers meantime.

Officers are accepted in the Polish Army in the rank they held in the British Army. The engagement is for six months' service, renewal in periods of three months, with 30 days' leave every year. Rates of pay are 500 marks monthly for second lieut., 600 for lieut., 800 for captain. The spending value of a mark in Poland to-day is nearly equal to that of a shilling in the United Kingdom.

[Surely this case comes under the Foreign Enlistments Acts?—Ed.]

U.S.A.

The following has been extracted from the official "Air Service News Letter," dated Nov. 25th, 1919.

Squadron Insignia Approved by the War Department.

SQUADRON INSIGNIA APPROVED BY THE WAR DEPARTMENT.

The War Department authorises publication of the following from the Operations Division of the General Staff :

The Secretary for War has approved the insignia for 44 airplane squadrons, submitted by the Director of Air Service. These insignia are for use only on planes and on baggage for the purpose of distinguishing the different squadrons, and will not be worn as shoulder insignia by individuals. They comprise the insignia used in the A.E.F. by the squadrons actually organised in France, which saw action at the front.

FIRST.—The American Flag.

EIGHTH.—A great American eagle, with the wings spread, holding the American Liberty Bell.

NINTH.—A silhouette showing the beams of three searchlights pointing upward and forming the numeral IX.

ELEVENTH.—A cartoon of Mr. "Jiggs" carrying a bomb under his arm.

TWELFTH.—The Twelfth's insignia is not given.

THIRTEENTH.—The figure of death depicted by a skeleton running at full speed with a bloody scythe in his hand.

SEVEVTEENTH.—The great snow owl flying through the air ready to pounce upon the enemy.

TWENTIETH.—Three legs in a circle arranged in pin wheel fashion comprise the insignia adopted by the Twentieth Squadron.

TWENTY-SECOND.—A number of stars in a ring with a large star with a tail, evidently a comet, superimposed, represents the 22nd Aero Squadron

TWENTY-FOURTH.—An American eagle pouncing upon the German dachshund which is running away with its tail between its legs.

TWENTY-FIFTH.—A cartoon of a masked headsman with an axe.

EXPRESS TRAVEL BY AIR

The remarkable reliability of the Airco machines which are running the Daily Air Service between London and Paris is shown by the following summary of flights and mileages:—

1. THE NEW AIRCO 16.

45 Flights were made during the first twelve weeks, with a total approximate mileage of 11,400 miles.

2. AIRCO 9B

37 Flights have been accomplished by this machine, covering an approximate total of 9,250 miles.

3. AIRCO 4A.

This well-known machine has successfully made no fewer than 95 flights between London and Paris during the first 12 weeks, covering a total distance of approximately 23,750 miles.

AIRCRAFT MANUFACTURING CO., LTD.

London Office
25-27, OLD QUEEN STREET, S.W.1.

Works:
THE HYDE, HENDON, LONDON, N.W.9

TWENTY-SEVENTH.—Another form of the American eagle, superimposed upon a large round spot.

TWENTY-EIGHTH.—A painted American Indian looking to the left. Its headdress includes a single feather.

FORTY-FIRST.—An oval enclosing a scene in an African desert, a camel appearing in the foreground. This is superimposed upon the numeral V, showing that the squadron was one of the Fifth Pursuit Group.

FORTY-NINTH.—A snarling wolf's head within a circle.

FIFTIETH.—A silhouette cartoon of a Dutch woman similar to the one in "Dutch Cleanser" advertisement.

EIGHTY-FIFTH.—Winged Cupid with a campaign hat sitting on the top of the world.

EIGHTY-EIGHTH.—A bucking broncho, ridden by a cowboy, all within a circle.

NINETIETH.—Pair of bones: the lucky number, seven, is uppermost.

NINETY-FIRST.—A mounted knight in pursuit of the winged devil, whose blood he has already drawn by the lance.

NINETY-THIRD.—An Indian head similar to that of the 28th, but in the reverse direction and bearing two feathers instead of one.

NINETY-FOURTH.—The well-known "hat in the ring."

NINETY-FIFTH.—The familiar kicking mule, poised on its front feet, ready to deliver a blow.

NINETY-SIXTH.—The head and shoulders of a red devil, who prepares to launch an aerial bomb. This figure is placed on a white triangular-shaped background.

NINETY-NINTH.—A conventional American bison in silhouette..

ONE HUNDREDTH.—The 100th Squadron shows the devil riding on an aerial bomb in flight.

ONE HUNDRED AND THIRD.—An Indian head with a large war bonnet decorated with a swasticka.

ONE HUNDRED AND FOURTH.—Figure of winged sphinx, placed in a large circle.

ONE HUNDRED AND THIRTY-FIFTH.—The Statue of Liberty with the rising sun as a background.

ONE HUNDRED AND THIRTY-EIGHTH.—A charging goat under full speed about to pass through the numeral V.

ONE HUNDRED AND THIRTY-NINTH.—An outline figure of flying Mercury.

ONE HUNDRED AND FORTY-FIRST.—A great Bengal tiger playing with a German helmet and iron cross.

ONE HUNDRED AND FORTY-SEVENTH.—A cartoon of a rat terrier.

ONE HUNDRED AND FORTY-EIGHTH.—The head of Liberty in a circle.

ONE HUNDRED AND FIFTY-FIFTH.—The head of a large arrow pointed upward.

ONE-HUNDRED AND SIXTY-SECOND.—A silhouette map of the United States.

ONE HUNDRED AND SIXTY-THIRD.—A silhouette of a cat with one eye closed standing on a bomb.

ONE HUNDRED AND SIXTY-FIRST.—A grinning clown with a cap and ruff.

ONE HUNDRED AND SIXTY-SIXTH.—Includes the sun with a pair of wings made of the American flag. In the foreground is a map of Europe, with Germany distinctly marked, while a hand, armed with an aerial bomb, hovers over it ready to drop the bomb.

ONE HUNDRED AND SIXTY-EIGHTH.—A winged skull in a circle.

ONE HUNDRED AND SIXTY-NINTH.—An unusual hieroglyphic somewhat similar to the monogram CB.

ONE HUNDRED AND SEVEVTY-FOURTH.—A black alley cat on a fence, silhoutted against the moon.

ONE HUNDRED AND EIGHTY-FIFTH.—A silhouette of a bat within a circle.

ONE HUNDRED AND EIGHTY-SIXTH.—Not reported.

TWO HUNDRED AND THIRTEENTH.—The head of an American Indian facing the right with two feathers in his scalp lock.

TWO HUNDRED AND FORTY-EIGHTH.—A black cat wearing a broad grin and decorated with a large bow tie made of an American flag.

TWO HUNDRED AND FIFTY-EIGHTH.—Reproduction of a lion, apparently carved out of stone.

TWO HUNDRED AND SEVENTY-EIGHTH.—Not reported.

THREE HUNDRED AND FIFTY-FOURTH.—A witch mounted on a broomstick supplied with model airplane equipment.

THREE HUNDRED AND SEVENTIETH.—A triangle with a star in the centre.

FOUR HUNDRED AND EIGHTY-SIXTH.—A large star or comet, with six smaller stars in its wake.

SIX HUNDRED AND THIRTY-EIGHTH.—A half-starved cat superimposed on the the numeral V, signifying the Fifth Pursuit Group.

ELEVEN HUNDRED AND FIFTH.—A winged elephant.

TWENTIETH.—An anarchist, ready to throw bombs.

EIGHTY-NINTH.—The front view of an American eagle in full flight.

A False Alarm.

It was reported on Dec. 20th that the Naval flying-boat N.C.4 (Lieut.-Comdr. A. C. Read) was several hours overdue. N.C.4 was engaged on a non-stop flight from Galveston to Mobile (Alabama). On the following day it was announced that the flying-boat was not missing but merely fog-bound at Grand Island, about 120 miles south-west of Mobile.

SUMMARY OF FOREST PATROL OPERATIONS, SEASON 1919.

THE CATTEWATER OLD BOYS CLUB.

The first meeting of the ex-officers and men who were stationed at the Seaplane Station, Cattewater, Plymouth, during the war was held at the Holborn Town Hall on Dec. 3rd in order to elect a committee to deal with all future dinners, reunions, etc., of this Club. Over 150 members were present, and it was decided to call the club "Cattewater Old Boys." The following Committee were then elected:—President, Mr. A. T. Sketchley, late Captain R.A.F.; secretary, Mr. Bosher; Mr. Kalber (late Lieut), Mr. Murphy (late Lieut.), Mr. Reid late Capt.), Mr. May, Mr. Ogle, Mamstree, Mr. Balch, Mr. Courtneidge. The first dinner will be held in London at the end of January. All members who were at Cattewater during the war are asked to send their names and addresses to Mr. Bosher, 33, Langdon Road, Junction Road, Highgate, N.

A PROBLEM.

The "Evening News" states that a correspondent at Wembley sent to the office of the paper a sample of washing "spattered all over with oil from the sky. The complete list of casualties was: 1 sheet, 1 vest, 1 white shirt.

"The problem is: Who is liable for the damage? Men learned in the law have been consulted. Some say the pilot is responsible, some say the owner of the machine, and others declare the maker of the engine should stand the racket.

"Until the Courts have fought it out the lawyers may well chuckle to themselves, 'It's an ill wind, etc.'"

One does not wish to appear unsympathetic, but one would point out to the owner of the washing that the cheapest and simplest course is to have the items re-washed unless he can sell them to a museum as souvenirs of Zeppelin raids.

HALF-WAY ROUND THE WORLD on "SHELL AVIATION" Motor Spirit.

Cable just received from the hero of the Great Australian Flight:—

"SHELL SPIRIT USED THROUGHOUT FLIGHT WITH COMPLETE SATISFACTION."

Ross Smith.

"SHELL AVIATION" Motor Spirit, as used by Captain Ross SMITH in his great Australian Flight, and by Captain SIR JOHN ALCOCK in his historic Trans-Atlantic Flight, is now available for your car, in the **Two-Gallon Cans Painted All-Gold**, typifying the incomparable quality and purity of this the world's most powerful and dependable motor spirit.

AIRCRAFT IN PARLIAMENT

HOUSE OF LORDS.

THE DOUGLAS-PENNANT INQUIRY.

On December 15th LORD HYLTON, Captain Yeoman of the Guard, moved that the report of the Women's Royal Air Force Inquiry relating to Miss Douglas-Pennant's charges be considered, in order to give noble lords who wished to speak on the matter an opportunity of doing so. He hoped their lordships would not think him presumptuous if he added that he felt the whole House had watched with admiration the patience and dignity with which Lord Wrenbury conducted the business of the Committee during its protracted sittings.

EARL STANHOPE said he desired to make a statement of an entirely personal nature. On the second occasion on which he brought the question of Miss Douglas-Pennant's dismissal from the W.R.A.F. to the notice of the House, July 30th, he made the statement, referring to scandals in the force :—

"I will give your lordships only one instance, and that is an instance in connection with which I have seen nearly the whole of the evidence and spoken to several of the witnesses." At the time he made that speech he was receiving statements with respect to the conduct of the Women's Air Force generally. The impression left on his mind in regard to the particular instance referred to was that he was justified in using those words. He was now convinced that he was not so justified, and he could only express his profound regret to the House for having made the statement.

In regard to his more general statements about grave irregularities, those were based on information which he considered trustworthy; but he now desired, so far as he was concerned, unreservedly to withdraw any imputation against individuals which might be contained in what he said.

Their lordships would do him the justice to remember that he had never at any time joined in making charges of immorality against the Women's Air Force. There were many thousands of women in that Force, and such a charge would be as absurd as it was grossly untrue. There was, however, one statement to which he ought particularly to allude.

His statement on July 30th contained a specific allegation of immorality against certain people. He desired to withdraw that statement and allegation unreservedly; and in doing so to apologise to their lordships for having made it.

There were others to whom he desired also to apologise. In making his statement he mentioned no names, but in the course of the inquiry names were necessarily made public. He desired therefore to apologise to Colonel Janson and Miss Glubb for having made any allegation against them. He had already communicated with their respective solicitors apologising for his statements, and had paid the whole of Miss Glubb's costs in connection with the inquiry.

He regretted that on the several occasions he brought this matter before their lordships he made statements that were inaccurate, and therefore misleading, and he trusted their lordships would realise how sincere was the apology he made.

EARL CURZON, Secretary of State for Foreign Affairs, said the House had listened with sympathy and respect to the obviously sincere apology offered by the noble earl. He did not desire to add to the difficulty and delicacy of the noble earl's position, but his personal explanation did not dispose of the case, because it was their lordships' House which by an almost overwhelming majority assumed a special responsibility in this matter; and it was fair to the House of Commons to recognise that it showed a juster perception of the character of this case than did some of their lordships.

In a short account of what had taken place he reminded the House that Lord Ampthill, who, he said, was far ahead of his colleagues in imputation, declared that the answers on the case given from the Government bench were wholly evasive and inaccurate. The solemn warning given by the Lord Chancellor on May 29th that their lordships in setting up a judicial inquiry would be taking a step which would lead to nothing but disaster and failure was ignored.

The Government declined to grant the inquiry, but subsequently a motion for the appointment of a Select Committee was carried in their lordships' House by 69 to 42. He thought then, and most of their lordships now thought, that a profound mistake was then made. But they were fortunate in obtaining the services of Lord Wrenbury as chairman of the Committee, and the tribunal over which he presided was an able and impartial tribunal.

The Committee's unanimous report stated among its findings that Miss Douglas-Pennant's charges of obstruction were not substantiated and that the accusations of immorality were wholly unsupported by evidence. It came, then, to this, that the charges which were so recklessly flung about, and had not spared authority, position, or sex, had completely broken down. Not one of the imputations made was sustained, and rarely, if ever, had there been an attack made by responsible persons which rested upon such flimsy foundations, and seldom, if ever, had such an attack, if delivered, met with such complete exposure and refutation.

He passed to the particular question to which Lord Stanhope had referred, not in the least degree with any idea of adding to the feelings of natural mortification and self-reproach to which the noble lord had just given expression; he mentioned it only because it had a wider implication and meaning. The main reason why their lordships had acted as they had was that they relied implicitly upon the character and statements of a noble lord possessing the reputation which Lord Stanhope enjoyed.

He could not help alluding to the passage in the Committee's report which related to the charge concerning the relations of a military officer and a young lady. The noble lord, he thought, committed a grave error in sheltering himself behind the privilege of their lordships' House.

A young lady was left to lie for months under the cloud of a disgraceful charge. She was compelled to submit to the indelicacy of a medical examination, she was subjected in the witness-box to a most dishonouring cross-examination by counsel for Miss Douglas-Pennant, and it turned out in the end, as the noble earl had asserted, that he had not seen a single witness, and he did not even know who told him.

As to the general charges of immorality at Hurst Park, they were equally deplorable, and they turned out to be equally unfounded. That such charges should have been made, based upon such evidence or lack of evidence, was proof of the length to which in this case recklessness and malice were allowed to go. Let their lordships remember that the Committee was set up not to consider charges of immorality, specific or general, although the victims of those charges were the persons who suffered most.

Scarcely anybody who could be brought within the purview of this matter was spared. The most wounding charges were made against ladies such as Lady Rhondda, Dame Katharine Furse, against eminent politicians, such as Sir Auckland Geddes, and against distinguished soldiers, such as General Bruncker.

If those charges had not been made under privileged conditions Miss Douglas-Pennant would have been answerable in damages and costs to a sum amounting to many thousands of pounds. As it was, the total expenses to the State in connection with this case would amount to over £10,000, of which only £220, the cost of the shorthand writers, could be charged upon the vote of the House of Lords.

Such was the financial consequence of this procedure. He failed to see any single compensating advantage. He hoped no lord who would speak after him would endeavour to make the point that the Committee was justified because of the complete exposure of the charges made, because that would be tantamount to saying that charges had only to be made sufficiently scandalous and sufficiently numerous in order to justify their lordships in setting up a Select Committee to inquire into them.

He would like to say one word as to the position in the matter taken up by their lordships' House. He was convinced that their lordships acted from perfectly honourable motives, and led by those motives they took the law into their own hands, and three times rejected the advice offered them by responsible Ministers of the Crown. They acted no doubt in the interests of justice, but they undoubtedly gave the impression—this was not the least unfortunate aspect of the case—that they were doing for one connected with their order what they would have been less eager to do for one of a humbler station. He did not say that was a just impression, but they had only to look at the papers to see that that impression existed.

The result of it all was that a large sum of public money had been expended, an immense amount of personal suffering had been caused and most inadequately compensated by the vindication that had been received, and a precedent had been set up which he agreed with the Committee in saying that they earnestly trusted would not form a precedent ever to be followed again. He thought this experience would lead every one of them to be less quick and impulsive in their suspicions, more moderate in the censures that they sometimes were too ready to pass upon public servants, more scrupulous in the evidence they required in support of charges of a very defamatory character, and, above all, more careful as to how they set in motion the great prerogative which, as the Upper House of Parliament in this country, they enjoyed.

The MARQUESS of SALISBURY said all their lordships respected Earl Stanhope for the very ample words he used in respect of the misinformation which he gave the House. But Earl Curzon was not content with speaking on that apology and the report of the Committeee, he also found considerable fault with their lordships' House for the action which the majority saw fit to take.

After all, the Prime Minister himself said an inquiry ought to be held. Although he (the Marquess of Salisbury) did not vote for the inquiry, it was fortunate that the suspicion which the previous history of this question had engendered was cleared away.

Earl Curzon had also reproved their lordships. That was an unusual thing for a member of the House to do. What the majority decided was generally accepted and submitted to.

He regretted that the noble earl should have suggested that in connection with any action which the majority of their lordships' House took there was a suspicion abroad that they would not have so acted if the lady in question had not been connected with themselves. He characterised such an impression as absolutely false. There was not a member who voted with the majority who was not inspired with the pure desire to see justice done.

* * *

HOUSE OF COMMONS.

Dec. 16th.—The following oral answer was given :—

ARMISTICE CONDITIONS.

Mr. CHURCHILL, replying to Brig.-Gen. Croft, said that Germany had handed over 5,000 guns, 25,000 machine-guns, 3,000 trench mortars, and 1,700 aeroplanes in accordance with the terms of the Armistice. These were the numbers laid down.

Dec. 17th.—The following written answer was given :—

MANSTON PARK STATION, MARGATE.

Mr. CHURCHILL, replying to Sir H. Nield, said that land at Manston Park belonging to Mr. J. Proctor was taken under the Defence of the Realm Regulations. It is proposed that this station shall be permanently retained for the R.A.F. This decision has only recently been made and is subject to Treasury sanction. Any question of the owner sustaining loss can be discussed in the course of the negotiations which must take place when the Ministry is in a position to take final action.

A Memorial.

It is proposed to build a Memorial and Thanksgiving Church at Billericay, Essex, where Major Sowrey, D.S.O., brought down an enemy airship, in the raid of Sept. 23rd, 1916. A site has been presented and a fund started, contributions to which may be sent to Messrs. Barclay and Co., Billericay, Essex.

Palmers in the £10,000 Flight.

After giving all due praise to the magnificent performance of pilots and mechanics in this epoch-making flight, a word or two should be said for the landing gear that made this performance possible, necessitating as it did halts at improvised aerodromes and landing grounds between London and Australia.

The "Vickers-Vimy" was fitted with four 900 mm. by 200 mm. Palmer landing wheels, or to put it in language better understood by the man in the street, four wheels shod with Palmer Cord Tyres three feet high and eight inches cross section.

All landings on this long flight were made without a single hitch, the various stages being reeled off with clocklike precision.

Hounslow to Melbourne makes a very big line on the map, and we look forward to the circumnavigation of the globe at not a very distant date by a British machine, and in the landings which will be necessary en route, we have every confidence that Palmer landing wheels and tyres will play an equally successful part.

Have your Works Photographed

from the

AIR

These striking photographs of famous Factories taken from the air illustrate the remarkable value of Aerial Photography for commercial and advertising purposes. Business men interested in obtaining really first-class aerial photographs of their factories, workshops, estates, etc., should write for full particulars of the Airco Aerial Photographic Department. Airco Aerial Photos are the finest in the world, and, owing to the excellent definition, are admirably suited for enlargement or reproduction.

THE AIRCRAFT MANUFACTURING CO., LTD.,
(Dept. A7a), HENDON, N.W.9.
Telephone: Kingsbury 220.

GREAT BRITAIN.

The Customs at Hounslow.

The Air Ministry announced on Dec. 19th that Customs officers will not be in attendance at Hounslow between Dec. 25th and 28th inclusive. Steps have been taken, however, by which their attendance can be arranged for on short notice. Owners or pilots of aircraft who desire to obtain a clearance to or from the Continent on these days should give notice to the Civil Aerial Transport Officer at Hounslow, at least one hour before the attendance of the Customs officer is required.

THE CONTINENTAL AIR SERVICES.

The Airco Service.

From Dec. 15th to Dec. 18th the weather was officially reported to be totally unfit for flying, and no machines left Hounslow or Le Bourget on the Airco service.

On Dec. 19th the weather was better, and Lieut. Powell piloting a D.H.9, left Hounslow at 12.41 p.m., with one passenger and the mail. The passenger was dropped at Lympne at 1.05 p.m., having been flown from Hounslow at 168 m.p.h The machine arrived at Le Bourget at 2.20 p.m.

On the journey from Paris, Lieut. McMullin and Lieut. Campbell Orde, both piloting D.H.9s, left Le Bourget at 12.30 p.m. with the mail and parcels, and having encountered very bad weather over the Channel, landed at Lympne at 4.10 p.m. The mails and parcels were conveyed to London by train.

Owing to adverse weather conditions no machines left Le Bourget or Hounslow on Dec. 20th.

The Inquest on Lieut. Bradley.

A verdict of accidental death was returned on Lieut. S. B. Bradley at Croydon on Dec. 17th. He was the pilot of the Airco machine which crashed at Caterham on Dec. 11th, as noted in last week's issue of THE AEROPLANE.

R.34 and R.39.

It is learnt from a private source that the Scottish-built rigid airships R.34 and R.39 have been sold to a private English aeronautical company for use as commercial air vessels. Since the termination of the Transatlantic flight on July 13th of this year, R.34 has been lying in her shed at East Fortune, and has since only taken the air for a short time. The famous observation ship R.29, which occupied the same shed at the station, has been dismantled and broken up.

R.39, which is being built at a factory in the West of Scotland, will, on completion, leave for Pulham, Norfolk, along with R.34, where both, after final trials, will be reconstructed for passenger and goods-carrying. The sale was effected as a result of Mr. Churchill's speech in the House of Commons on Dec. 16th, when he stated that all British airships were to be sold for commercial use. The Naval Authorities will have, however, first claim on the use of the vessels in case of necessity.

BROOKLANDS.

A correspondent writes :—

There has been a slight increase in the amount of flying done at Brooklands during the past week. Machines taking the air were "Vimy" commercial and bombing machines, Mr. W. G. Chapman's 90-h.p. Curtiss D.H.6, one or two Sopwiths of various types, various Martinsyde F.4s and "A" machines, and the Vickers "Viking," amphibian, on which the late Capt. Sir John Alcock, K.B.E., D.S.C., crashed, and which he was testing at Brooklands. The flying-boat hull of this machine was unmistakable in flight. The machine appeared to be flying satisfactorily and to have a fair speed.

Great gloom prevailed at the Weybridge works of Vickers, Ltd., after the hearing of the news of the death of Capt. Sir John Alcock. He was greatly esteemed, respected, and admired by the workpeople, and was a familiar figure at the factory. It was reported that the "Viking" was in perfect flying condition when he left Brooklands for Paris, and that it appeared to be flying well as it left the aerodrome.

LEEDS.

Commander J. L. Cope, B.A., F.R.G.S., F.Z.S., who is to command the British Imperial and Antarctic Expedition to start from England in June, 1920, is taking with him a Leeds-built Blackburn "Kangaroo." The machine has already been bought and removed from the city.

The coming expedition, which, it is expected, will extend over five years, is the first on which an aeroplane has been taken. It will be carried to the last permanent winter quarters, whence trips will be made in the direction of the Pole in order to report on the conditions. As the party advance, food and other necessaries will be carried by this means from the base.

NEWCASTLE.

A correspondent writes :—

The City Council here are having plans prepared for sites for new aerodromes in two different localities, one at Kenton Road, one mile west of Moor Aerodrome, and second at Denton Road, two miles west of Moor Aerodrome. Meanwhile, all aviators are using Town Moor Aerodrome.

The Berkshire Aviation Co. started taking up passengers at Newcastle on Dec. 8th, and finished on Dec. 22nd, when they went to Edinburgh to give another "Flying Week." They are one of the only firms in Great Britain to continue taking up passengers in the winter. Glasgow will be visited after Edinburgh.

Their motto is :—

"Rain, Shine, Snow or Blow,
Pay your Quid and up you go."

SHEFFIELD.

Capt. C. A. Lewis, M.C., of the aviation department of Vickers, Ltd., has drawn up for the Sheffield Development Committee a suggested scheme for the establishment of a daily air service between Sheffield and London. Two aeroplanes would fly from Sheffield to London in the morning and two others would fly from London to Sheffield in the afternoon. At a cost per passenger per journey of £8, the undertaking would, it is estimated, yield 10 per cent. on an approximate capital outlay of £50,000.

AUSTRALIA.

Reuter telegrams, dated Dec. 20th, state that Capt. Ross Smith, on his flight across Australia, was obliged to land at Anthony's Lagoon, owing to a broken airscrew. This was repared, and he expected it to last until he reached Sydney.

He was next reported at Camonweal, and reached Cloncurry (Queensland) on Dec. 20th. The distances of Anthony's Lagoon, Camonweal, and Cloncurry, north-west of Brisbane, are approximately 1,300, 1,090, and 930 miles.

Flights from Tasmania.

The Bass Straits which separate Tasmania from Australia were flown across for the first time on Dec. 15th by Lieut. Long in an Alliance aeroplane. A few hours later a Sopwith machine arrived in Tasmania from Melbourne.

NEW ZEALAND.

A correspondent writes from Wellington :—

Aviation yet is in its infancy here, but soon it is hoped that both the Government and private firms will get busy. The climatic conditions of the Dominion are dead against aviation, and so it is extremely probable that the fight for supremacy will be most interesting and exacting. The continual gusty winds and the mountains afford no help to aviation.

It is believed that an important commercial venture is shortly to be started in New Zealand. A concern, which will form part of, or be connected with, the Larkin-Sopwith Company of Australasia, intends to begin operations. The headquarters will probably be at Auckland, where a flying school already exists, but aerodromes will be built in all the main centres. The company proposes to sell machines, institute flying lines, and undertake commercial flights, etc.; in fact, its operations will embrace everything practicable from a commercial aspect.

Passenger services will be instituted between all the principal cities. The main lines will, no doubt, be between Wellington, the capital of New Zealand, and Auckland, and Wellington and Christchurch and Dunedin. Auckland and Christchurch are the only two centres where aerodromes exist at the present time; and, in both cases, they are the sites of flying schools. Seaplanes are mostly used at the former city.

192 miles per hour with a Lumiere Propeller.

This world's record was made by M. Sadi-Lecointe on a Nieuport 300 h.p. Hispano biplane on December 15th.

All French pilots insist on Lumiere Propellers for making new height and speed records. They know that this design gives them 5% better overall efficiency.

Let us supply a test propeller for new and existing machines at our expense.

Xmas

We are not such hardened business men—neither are you—as to deny that at this season of the year the whole atmosphere of Life is charged with the electricity of Goodwill. It envelops us—it wraps us round—it fills every corner of our mind—carries our thoughts to every corner of the earth where we have friends, business or otherwise—in every sphere it is the same, and on or about the morning of the day when this message first appears in print we shall each of us wake up with these old familiar words upon our lips—

A Merry Christmas

And may every reader of "The Aeroplane"—every customer of ours, past, present, and prospective—share in that merriment and find therein a joyful pause in the arduous round of everyday activities.

JOHNSON & PHILLIPS, Ltd.,
Electrical Engineers and Cable Makers since '75,
CHARLTON, LONDON, S.E.7.
City Office: 12, Union Court, Old Broad St., E.C.2

Wellington will be a very hard nut for the company to crack. It is centrally situated and the leading seaport of the Dominion, but it is very windy and surrounded by hills. The aerodrome is likely to be situated at one of the bays, providing the ground can be obtained, or at Miramar or Trentham. But at all these places the difficulties which have to be overcome are very great.

The line between Wellington and Christchurch lies over Cook Strait, a narrow strip of often very treacherous sea. The Auckland-Wellington run is over land the whole way. Landing grounds will be very scarce, however. At present, the Air Adviser's report is anxiously awaited for.

Lieut. D. C. Inglis, D.C.M., of Christchurch, will be prominently connected with the running of the New Zealand concern. Lieut. Inglis left New Zealand with the "Main Body," and gained the Distinguished Conduct Medal on Gallipoli. After service in France he transferred to the Royal Air Force and served for some time in France in a fast scout machine.—C. H. B.

THE WEST INDIES.

The Latin-American Division of the Bureau of Foreign and Domestic Commerce has announced that an English aviation company known as the Bahamas and West Atlantic Avro Co., Ltd., has been incorporated recently under the laws of the Bahamas.

The company plans to establish a commercial and passenger air service between Nassau and Miami (Florida) in January, 1920. The service will ultimately be extended to other West Indian islands.

BRAZIL.

According to the monthly bulletin of the British Chamber of Commerce in Brazil, dated Oct. 31st, the preparations of Handley Page, Ltd., for instituting public air services in various Brazilian zones, and starting with a service from Rio de Janeiro, south to Pelotas (Rio Grande do Sul), are at an advanced stage.

CUBA.

Fifteen million dollars is to be appropriated by the Cuban Government to the purchase of aeroplanes and airships to establish aerial mail and passenger services to the United States and other countries.

The Third Pan-American Aeronautic Congress is to be held at Havana from Feb. 21st to March 1st, 1920, inclusive, and over 25,000 dols. will be awarded in prizes to the aviators participating in the aerial contests.

Mr. Hannibal J. de Mesa, the President of the new Aerial League of Cuba, has bought two 16-passenger and four 3-passenger aeroplanes in France for the purpose of establishing an aerial transportation line between Cuba and different cities in the United States.

An organisation known as the Aerial League of Cuba has been founded with the co-operation of the Aerial League of America, with which it is affiliated, and the Aero Club of America. The Honorary President of the League is His Excellency General Mario G. Menocal, President of Cuba. As above, Mr. H. J. de Mesa is the President

DENMARK.

The Handley Page Tour.

The Handley Page aeroplane piloted by Capt. Stewart and Capt. Gran which flew from London to Denmark last summer has just concluded a number of demonstration flights in Scandinavia. The weather conditions met with were somewhat trying for aviation, as the country abounds with mountains and lakes, which fill the atmosphere with "lumps" and cross currents, apart from the difficulties such landscape presents in the event of forced landings.

On one occasion two snow ploughs had to be utilised to clear the ground before the machine could "take-off," and when it did start to run across the ground the slip stream from the airscrews sent great showers of snow seven feet high.

The machine gave exhibition flights at Copenhagen, Arrhus, and Christiania, where 454 passengers were given flights, including officials from the Legation. Great interest was taken in the aeroplane by the inhabitants and the flying officers stationed near Denmark. The latter had only a few Henry Farmans and Avros, and they were astounded when Capt. Stewart took an Avro up and carried out a few "stunts." Stunting is not a widespread art in Scandinavia, and Capt. Stewart on landing after a flight in which he mildly stalled the Handley Page, was enthusiastically congratulated on his excellent "loop."

FRANCE.

The Paris-Melbourne Flight.

After three ineffectual starts, owing to fog, M. Poulet left Rangoon at 8 a.m. on Dec. 8th, with the intention of alighting at Moulmein and thence proceeding to Bangkok. His engines were thoroughly overhauled at Rangoon.

When he had covered 100 miles and was flying at an altitude of more than 3,000 ft. above the mountains of Siam, a flight of vultures was encountered. One of the birds struck the right airscrew which broke, and a disaster was only narrowly avoided.

He made a successful landing in the mountains, and fitted a new airscrew, which he carried slung in his undercarriage. M. Poulet then returned to Moulmein, where he landed in the middle of the night.

The "Intransigeant" has opened a subscription for M. Poulet. The names of some of the most famous aviators of France are on the list, which totalled on Dec. 17th, over 5,000 francs.

Another Record.

A Reuter message from Paris, dated Dec. 26th, stated that Lieut. Roger, with two passengers, on that day reached an altitude of 6,000 metres, notwithstanding the fact that he had to fly through a dense fog during the first 4,000 metres. This is claimed as a record for altitude. The previous record was claimed by M. Poulet, who reached an altitude of 5,420 metres.

GERMANY.

The Handley Page machine piloted by Capt. Herne and Capt. Davis, which is flying to Warsaw, has continued its journey from Berlin, and reached Posen. The machine has created considerable interest, and in some cases alarm, among the German villagers, who are puzzled by the British marking and the unfamiliar appearance of the machine, which is not so well known there as in the Rhine provinces, to which it paid frequent bombing visits during the war.

HOLLAND.

At the beginning of next year, besides the aviation routes to be opened in Holland with connections to the South, there will be services between Holland and Germany, and Holland and England. It is also hoped to establish a service to the Dutch East Indies. The contracts for the service to England and probably for the Dutch East Indies have been given to British firms.

ITALY.

The Italian correspondent of THE AEROPLANE writes:—

The Federation of Aero Societies.

On 7th inst., at Milan, the Federation of Italian Aeronauts was formed for the purpose of uniting all those in any way engaged in aeronautical enterprise. The Turin "Association of Aviators and Aeronauts" joined the Federation en bloc, and steps were taken to approach the other existing societies on the matter. The Secretary of the National Aerial League also assisted. The Federation aims at being purely civilian.

A Successful Trial Flight.

The two Ricci Bros. of Naples send me news of their large seaplane, a three-engined 800-h.p. affair which began its trials on the 12th inst in the Bay of Lucrino, Naples, where the I.A.M. works are. The machine, not at full load, but with a useful cargo of 1,000 kilograms, reached a speed of about 170 the hour, considered quite good for a trial flight. It is

GERMANY'S RIGHTEOUS PRIDE.—The sketch, from "Luftpost," depicts a passenger in the new commercial Zeppelin "Bodensee," saying "*Prosit*! The country which produced such technical skill can never go under!"

A NEW CLUTCH RING.

Pure Asbestos without WIRE.

AN entirely new departure in the method of fitting fabric linings to plate clutches. The rings are made endless of die-moulded asbestos without wires, and are so constructed that free movement is assured in all circumstances; they float in a recess.

The rings being free both sides take up the pressure, which is evidenced by the marked sweetness of action.

We have tested these rings exhaustively at our works. A ¾-in. wide ring of 14 ins. outside diameter, area 36 sq. inches, under a pressure of 22 lbs. per square inch transmitted 30 h.p. at 1,000 revs.

This is undoubtedly the last word in clutch linings and fuller information will be sent on request.

'Phone - - - 29 & 30 Southall.

intended to carry 15 passengers and a good lot of post or cargo. I understand the pilot was Bornancin, of Pordenone.

The Government Competition.

It is stated by a Southern paper that 2,000,000 lire is the prize money that the Government intends to offer for the best results in the Small Machine and Large Seaplane Concours which it is promoting. There would be, according to the journal, about 11 months' grace before the machines have to toe the line before the awful judges.

For the Tokio Flight.

A Caproni triplane preparing for the Tokio flight left Milan and reached Rome in 3½ hours, piloted by Lieut. Abba, one day last week.

Next Year's Grand Prix.

The Grand Prix of the Italian Aero Club and Italian Aviation Society is to take the following lines this next year: A contest for very small single-seater flyabouts, ditto for fast machine carrying pilot, passenger and having fuel capacity of about 500 kilometres, and a competition for machines with large weight carrying properties which must fly with at least a third of their h.p. out of service. By desire of the club's trade members these competitions are to be international. In the two first the greatest speed range will be accounted specially praiseworthy.

The Mail Service to Greece.

The Government has reminded Greece of the Postal Service Contract obligations signed between the two countries some long while back and noted in these columns. One believes the reminder refers to the Corfu Airport. The other end is that at Brindisi.—T. S. H.

POLAND.

The London-Warsaw Flight.

Capt. E. D. C. Herne, the pilot of the Handley Page biplane which successfully flew through Germany, telegraphed to Berlin on Dec. 20th that he had arrived safely at Warsaw in a blinding snowstorm.

SWITZERLAND.

The Italian correspondent of THE AEROPLANE writes:—

German Machines.

A Zepp.-built machine with eight people on board flew from Neuchatel to the opening of the Geneva Airport ceremonies. One understands this machine was one of the 20 sold recently to a Swiss company and that they have two 270-h.p. engines. The Ad Astra firm have four ex-military pilots to fly these machines.

The Geneva-Lausanne Service.

The Geneva-Lausanne passenger service costs 75 (Swiss) francs each way and 130 francs for a return ticket. The craft used are three-seater S.I.A.I. waterplanes.—T. S. H.

Civil Flying.

When the winter sports are in full swing there will be on special occasions an aeroplane passenger service between Zurich and St. Moritz. At Lugano and elsewhere civil flying promises to be very popular.

The military aviation authorities are helping the private firms very greatly, and the military aerodrome at Dübendorff, near Zurich, is to be placed at the disposal of civilian flying.

Flying weeks have been arranged near many of the chief towns, and, in order to popularise flying, lists of recent civilian passengers are posted in the streets of Berne and other cities.

The Conditions.

There are many difficulties to face in flying in Switzerland. The available spaces for landing are very small, and the thinness of the atmosphere at possible fields on the higher slopes of the mountains makes landing a precarious business, as the machine must be "put down" at a speed far above its normal landing speed, or a "pancake" will result.

Landing would not be difficult in the long level valleys, but most of them are spoilt for flying purposes by telegraph and telephone wires.

Developments.

A new aerodrome of which great things are expected is being constructed at Thun on the shores of the lake. A considerable number of machines are being built in the factory at Thun, including the Ilaefeli D.H.5.

UNITED STATES OF AMERICA.

The Boom of Civil Aviation.

The Special Commission to Organise the First Aerial Race around the World have issued a report on the numbers of aeroplanes sold for civil purposes throughout the United States this year.

This Commission was appointed by the Aero Club and the Aerial League of America, and includes as members, Mr. Louis D. Beaumont, the President of the Commission; Mr. Alan R. Hawley, the President of the Aero Club; Mr. Henry Woodhouse, the Vice-President of the Aerial League; and Major Charles J. Glidden, who is the Executive Secretary of the Commission.

They have travelled to numbers of towns in the United States and obtained the available data of the present and prospective aeronautic activities. In Chicago alone 380 aeroplanes have been sold since June, and in the cities so far visited nearly 1,000 have been sold. These machines are used for passenger and goods-carrying.

The "Aerial Age" states that the Commission was told that people were unable to buy aeroplanes, as the manufacturers could not deliver fast enough, and could not supply large multi-engined aeroplanes or flying-boats. Also, the aeroplane dealers in the cities stated that they could have sold ten times the number machines they were able to obtain.

The paper also states that in some places large automobile dealers have taken up the aeroplane business and stated their readiness to place orders for 100 machines of each type for next year. One dealer who bought 100 aeroplanes last June sold them all within 60 days and then bought 40 more, which he sold, and could dispose of 200 more if he could get deliveries. A Chicago dealer sold 750,000 dols. worth of aircraft parts and supplies.

Now that the military restrictions are removed a great aeronautic boom has started which has practically no limit except a possible failure on the part of manufacturers to provide suitable aircraft in large enough numbers.

Commodore Beaumont, Major Glidden, and Mr. Hillman, of the Commission to Organise the First Aerial Race round the World, were to sail for Japan and travel through 32 countries organising this competition.

Cross-Country Flights.

A schoolboy and his mother were flown recently in a Curtiss "Oriole," fitted with a 150-h.p. K.6 engine from Houston, Texas to Mineola, Long Island, a distance of 2,500 miles. The journey was started on Sept. 28th, and Mineola was reached on Oct. 7th, after a three days' stop at Binghampton, owing to fog. The "Aerial Age" states that the flying time was 19 hr. 45 min., and only 36 gallons of petrol were used. The cost of the journey, including all expenses—hotels, meals, etc.—was less than 275 dollars, of 3 2/3 cents per mile per person.

Mr. Emery H. Rogers, the manager of the Syd Chaplin Aircraft Corporation, recently established a new record by flying from San Francisco to Los Angelos (538 miles) in 4 hours 8 minutes with one passenger. The machine used was a Curtiss "Oriole" (K.6 150-h.p. engine).

The Lawson air liner started on its voyage from Mineola early in September, and having stopped at Cleveland, Buffalo, Syracuse, Mineola, Washington, and Connellsville has arrived at Dayton, Ohio, a total of some 1,800 miles. The machine is to continue to St. Louis. Ten to 20 passengers have been carried on various stages of the flight. According to the "Aerial Age" of Oct. 13-20th, in one of the first trial flights one of the engines was stopped immediately after taking off and the machine climbed to 11,000 ft. with one engine alone.

The four-engined Handley Page biplane which was intended for the trans-Atlantic flight and recently flew from Parrsboro, N.S., to Greenport, L.I., was flown over New York City on Oct. 13th.

An Aerial Mail Service Project.

The Governor of Puerta Rico is endeavouring to obtain Federal aid in a mail carrying project between that place and St. Thomas. The mail is now carried by slow sailing vessels, and although the distance between the two islands is only 30 miles, the mail takes more than 24 hours to get across. A flying-boat could make the journey in half an hour.

It is also planned to open up an aerial mail service to Hayti.

In connection with the great sugar fields aeroplanes would be very useful for the use of supervisors in trips over the plantations, many of which cover thousands of acres. These inspections now take many hours by motor-car, and the roads are not good.

With an aeroplane it will be a matter of minutes where it is now a question of hours. Aerial views from time to time will give a splendid idea of crop conditions for the use of the sugar companies.

Replanting Forests by Aeroplane.

The Forestry Service has been urged by a representative to start a reforestation programme for the fire-denuded areas in the Sierra Madre range by using aeroplanes to scatter millions of tree seeds over these mountains as soon as the rainy season begins.

MILITARY.

WAR OFFICE, Dec. 15th.

REGULAR FORCES.—OVERSEAS FORCES.—CANADA.—Can. Forestry Corps.—Temp. Lt. D. Neil ceases to be secd. to the R.A.F., Sept. 3rd (substituted for "Gazette" notification, Aug. 2nd, p. 9953, incorrectly specifying date as July 14th).

WAR OFFICE, Dec. 16th.

REGULAR FORCES.—R.F.C.—Mil. Wing.—Equip. Officer, 3rd Class.—Temp. Sec. Lt. A. F. Nethey, Gen. List, Oct. 29th, 1917.

MEMORANDA.—Col. the Rt. Hon. J. E. B. Seely, C.B., C.M.G., D.S.O., T.D., T.F., relinquishes the temp. rank of Maj.-Gen. on ceasing to be specially empld., Jan. 13th.

Sec. Lt. W. L. Rennie (attd. R.A.F.) retires, receiving a gratuity, Dec. 17th.

TERRITORIAL FORCE RESERVE.—Col. (temp. Maj.-Gen.) Rt. Hon. J. E. B. Seely, C.B., C.M.G., D.S.O., T.D., from Active List, to be Col., and is granted the hon. rank of Maj.-Gen., Dec. 17th.

WAR OFFICE, Dec. 16th

The King has been pleased to approve of the following rewards being conferred on Officers and other ranks of the Royal Air Force in recognition of gallantry in escaping from captivity while prisoners of war :—

BAR TO THE MILITARY CROSS.

Lt., T./Capt. (now Sqdn. Ldr.), T. W. Mulcahy-Morgan, M.C. (R. Ir. Fus.); Capt. A. J. Bott, M.C. (R.G.A., S.R.); Sec. Lt. (now Capt.) A. J. Evans, M.C.; Pilot Officer (Hon. Flying Officer) G. P. Harding, M.C.; Flight Lt. E. W. Leggatt, M.C. (Wilts. R.); Lt. S. G. Williams, M.C. (Devon. R.)

THE MILITARY CROSS.

Lt. L. J. Bennett; Lt. T. B. Bruce; Lt. S. E. Buckley (5th Northants); Capt. (now Maj.) D. B. Gray (Ind. A.); Flying Officer D. W. Grinnell-Milne, D.F.C. (R. Fus.); Flight Lt. G. S. M Insall, V.C.; Lt. C. Kennard; Flight Lt. G. F. Knight (R.W. Surr.); Flying Officer P. C. C. Martin (Can. Fd. Arty.); Sec Lt. P. A. O'Brien; Lt. F. J. Ortweiler; Lt. S. S. B. Purves (Sco. H.); Flt. Officer (Hon. Flt. Lt.) J. S. Poole, D.S.O. (K.R.R.C.); Flying Officer L. C. Russell (R. F's.); Flight Lt. L. D. Stewart, A.F.C. (R.G.A., T.F.); Flying Officer A. P. Taylor; Lt. J. K. Tullis (R.F.A.); Lt. L. A. Wingfield, D.F.C. (R.F's.).

THE MILITARY MEDAL.

21293 Sjt. J. Dempsey, R.A.F.; 143510 A./C./H. H. Harvey, R.A.F.; 46209 Sjt. W. Hawkins, R.A.F.

WAR OFFICE, Dec. 17th.

REGULAR FORCES.—INFANTRY.—SERVICE BATTALIONS.—Durh. L.I.—Temp. Sec. Lt. F. Hill, from R.A.F., to be temp. Sec. Lt., April 20th, 1918.

AIR FORCE.

AIR MINISTRY, Dec. 12th.

The notifications appearing in the "London Gazettes" of the dates indicated below, appointing the following officers to short service commns., are cancelled :—Flying Officer G. A. F. Gibson (T.) (substituted for notification in the "Gazette" of Nov. 28th), Sept. 12th; Flying Officer E. A. M. Waterton (A.), Oct. 24th; Flying Officer B. Turner (A.P. T.), Nov. 11th; Flight Lt. G. M. Boumphrey (A.), Nov. 28th.

The rank of Observer Officer G. S. L. Hayward, M.C., is as now described, not Flying Officer (A.), as stated in the "Gazette" of Oct. 24th.

R.A.F.—Flight Lt. K. H. Kiversdale-Elliot (A.) is granted a permanent commn. in the rank stated, with effect from Aug. 1st.

The following temp. appointments are made :—Staff Officer, 2nd Class.—(T.) Sqdn. Ldr. H. Stanley-Adams, D.S.C.; Dec. 4th.

Staff Officer, 3rd Class.—(T.) Flying Officer O. W. de Putron, Nov. 11th.

FLYING BRANCH.—Sec. Lts. to be Lts. :—A. McK. Matheson, Feb. 22nd; C. A. B. Caukwell (since demobilised), March 26th; H. Edge, May 28th; G. C. Lugg, June 6th; P. Fish, June 18th; M. Tallentire, July 5th; A. H. Allingham (since demobilised), July 20th; S. P. Watts, July 24th; A. Findley, July 30th.

Pilot Officers to be Flying Officers :—H. B. Williams, Aug. 23rd; K. W. Jones, Nov. 8th.

M. B. D. Whiteside (Lt., High. L.I.) (since deceased) is granted a temp. commn. as Sec. Lt., and to be Hon. Lt., May 31st, 1918.

Pilot Officer (Hon. Flying Officer) L. R. Hibbert (Capt., R. Lanc. R.) relinquishes his temp. R.A.F. commn. on return to Army duty, Nov. 18th.

The following relinquish their commns. on ceasing to be empld. :—Sec. Lt. D. R. Bradley, Aug. 10th, 1918; Capt. N. MacMillan, M.C., June 10th.

Transferred to unempld. list :—Sec. Lt. C. E. Turner, Jan. 26th; Sec. Lt. T. C. Ormrod, Feb. 11th; Lt. H. Harris, Feb. 28th (substituted for notification in "Gazette," Oct. 10th); Lt. L. Smith, March 13th; Sec. Lt. R. W. Frost, March 22nd; Sec. Lt. S. A. Garratt, March 23rd; Lt. A. E. Francis, April 14th; Lt. V. P. Cronyn, April 19th; Lt. P. W. Plaxton, May 23rd; Capt. J. E. D. Boyd, June 1st; Lt. E. B. Corry, Sec. Lt. B. T. P. O'Brien, June 13th; Sec. Lt. J. D. Chisholm, Lt. W. H. Collins, Sec. Lt. H. C. Cook, Sec. Lt. W. E. Cook, Sec. Lt. R. A. Crecine, Sec. Lt. D. A. L. Curtis, July 12th; Lt. (Hon. Capt.) U. A. Currie, July 28th; Sec. Lt. S. A. Pindar, Aug. 8th; Lt. E. O. Ockerby, Aug. 15th; Lt. J. E. Croden, D.F.C., Aug. 16th; Sec. Lt. H. H. Peterson, Lt. G. E. Pfeifer, Aug. 22nd; Sec. Lt. H. F. Cullen, Aug. 25th; Lt. A. A. Crowson, Aug. 27th; Sec. Lt. A. G. Peake, Sec. Lt. H. W. Perkins, Aug. 29th; Lt. W. A. Clarke, Sept. 2nd (substituted for notification in "Gazette," July 15th); Sec. Lt. L. W. C. Pearce, Sept. 8th; Lt. L. Michell, M.C., Sept. 10th; Sec. Lt. G. S. Cowie, Lt. G. T. Polkinghorne, Sept. 13th; Sec. Lt. G. H. Cote, Sec. Lt. H. C. Cramer, Sec. Lt. G. H. Palmer, Sec. Lt. T. C. Porteous, Sept. 26th; Lt. H. C. Wright (substituted for notification in "Gazette," Oct. 28th, wherein this officer's rank was shown as Sec. Lt.), Sec. Lt. P. Anderson (substituted for notification in "Gazette" of Oct. 17th), Sec. Lt. B. O. Mayne, Sept. 27th; Lt. A. E. Bingham, Sec. Lt. A. L. Burran, Sec. Lt. E. J. Christie, Lt. R. L. Clapp, Sec. Lt. G. W. Cormack, Sec. Lt. D. M. Cowan, Sec. Lt. F. Baker Cox, Sec. Lt. M. Crawford, Lt. (Hon. Capt.) F. W. Crosbie, Sec Lt. H. A. Henry, Sec. Lt. J. L. Hunter, Sec. Lt. C. W. King, Sec Lt. W Leith, Sec. Lt W. H. McCardell, Lt. G. T. Miles, Sec. Lt. J. C. Morgan, Sec. Lt. Sqdn. Ldr. (actg. Wing Comdr.) R. Hall, O.B.E. (Capt., R. Welsh Fus.), relinquishes his temp. R.A.F. commn. on return to Army duty,

You couldn't see it from below

but it's nevertheless a fact—a fact which every flying man and aircraft manufacturer should note—that the majority of the machines competing in the Aerial Derby, including the three which were placed 1st, 2nd and 3rd, at the end of the race, were fitted with

AUSTER TRIPLEX AERO WIND SHIELDS

And that proves what the men who "know" think of them.

Let us have YOUR enquiries.

THE FLYING PUBLIC at PARIS will have another opportunity of witnessing next week the wonderful flying qualities and constructional features of the famous **KANGAROO.**

The BLACKBURN AEROPLANE and MOTOR CO., LTD.
Leeds. Hull. London.

Blackburn AIRCRAFT

Army duty :—Flying Officer R. D. H. Draper (Lt., Yorks. L.I.), Dec. 19th, 1918); Flying Officer W O. Hatcher (Lt., Scottish Rif.), Nov. 8th; Flight Lt. J. B. E. Crosbee (Lt., Worc. R.), Nov. 28th; Pilot Officer (Hon. Flying Officer) S. Waring (Lt., Leic. R.), Nov. 30th.

Transferred to the unempld. list :—Sec. Lt. H. L. Godfrey, March 17th; Capt. (actg. Maj.) J. Fowler, April 1st; Lt. E. A. Marsland, April 11th; Sec. Lt. D. T. Davies, Aug. 2nd; Sec. Lt. L. H. Meyer, Sept. 23rd; Sec. Lt. P. D. Box, Sec Lt. G. S. Burns, Sept. 28th; Lt. A. E. T. Robinson, Oct. 11th; Sec. Lt. E. M. Spinney, Nov. 13th; Maj J. B. Batten, D.S.O., Sec. Lt. (Hon. Lt.) A. Nash, Nov 20th; Sec. Lt. (Hon. Lt.) D. A. Childs, Capt. W. J. May, Nov. 24th; Lt. H. J. Axten, M.B.E., Dec. 1st; Lt. E. J. Crowe, Lt J. C. B. P. Seaver, Dec. 4th; Lt. A. E. Marks, Dec. 6th; Capt. W Fergusson, Dec. 9th.

Lt. T. D. S. Purdey (Lt., Argyll and Suth'd Highrs.) resigns his commn., Dec. 17th.

The surname of Lt. T. M. Goldon is as now described, and not "Golding," as stated in the "Gazette" of April 1st.

The notifications in the "Gazettes" of Dec. 31st, 1918, and May 9th, concerning Sec. Lt. (actg. Lt.) (Hon. Capt.) C. J. P. Copner, are cancelled.

The notification in the "Gazette" of July 22nd concerning Lt. (actg. Capt.) F. J. Wood is cancelled. (The notification in the "Gazette" of July 29th to stand.)

TECHNICAL BRANCH.—Lt. W. Bagnall to be actg. Capt. whilst empld. as Capt., Grade (A.), Nov. 1st, 1918 (substituted for notification in the "Gazette" of Feb. 21st).

Flying Officer F. Murphy, M.B.E., relinquishes the grading for pay and allowances as Flight Lt. on ceasing to be empld. as Flight Lt., Grade (A.), Aug. 19th.

Lt. H. E. Crocker to be Lt., Grade (B.), from (A.), April 17th.

Sec. Lts. to be Lts., Grade (A.) :—(Hon. Lt.) J. J. Page, April 2nd, 1918 (substituted for notification in the "Gazette" of July 29th); McL. N. Staight, Dec. 26th, 1918.

Sec. Lt. (Hon. Lt.) W. A. Cockburn to be Lt., Grade (A.), Feb. 6th, without pay and allowances prior to March 24th

Pilot Officers to be Flying Officers, Grade (A.) :—A. E. Davies, Sept. 27th; J. C. W. Fraser, A. Ledgerwood, A. J. Ramsey, V. Rees, Oct. 1st.

Pilot Officer W. O. L. White to be Flying Officer, Grade (B.), Oct. 1st.

Pilot Officer R. A. Sibun to be Flying Officer, without the pay and allowances of that rank, Oct. 1st

Pilot Officer W. J. Coadwell relinquishes the grading for pay and allowances as Flying Officer on ceasing to be empld. as Flying Officer, Grade (A.), Dec. 1st.

The following relinquish their temp. R.A.F. commns. on return to Army duty :—Flying Officer H. S. Royffe (Lt., Midd'x R.), Nov. 17th; Sqdn. Ldr. H. F. T. Blowey, O.B.E. (Capt., R.F.A.), Nov. 22nd, Sqdn. Ldr. E. E. Bush (Lt., W. Rid. R.), Dec. 10th.

Transferred to unempld. list :—Sec. Lt. A. L. Flaws, Feb. 15th; Lt. A. Ross, March 17th; Lt. H. B. Low, March 23rd; Lt. F. E. Glass, April 12th; Lt. A. S. Clark, June 21st; Lt S. J. Hunter, Aug. 10th; Sec. Lt. M. E. Clubine, Aug. 16th, Lt. W. R. Lewis, Aug. 20th; Sec. Lt. (Hon. Lt.) A. N. Pictor (Som. L.I.) (substituted for notification in "Gazette" of Aug. 1st); Lt. W. T. Henry, Oct. 15th (substituted for notification in "Gazette" of Nov. 4th, wherein this officer's rank was shown as Sec. Lt.); Capt. A. C. Day, Oct. 20th; Sec. Lt. H. C. Martin, Nov. 3rd; Lt. J. S. Done, Nov. 7th; Lt. R Frater, Nov. 10th; Lt. H. B. Brown, Lt. A. A. Gillman, Nov. 13th; Capt. J. D. Clarke, Nov. 22nd; Lt. J. W. Gardner, Sec. Lt. P. H. Matthews, Nov. 25th; Capt. H. K. Kennedy-Skipton, Lt. F. G. Murray, Nov. 27th; Sec. Lt. W. H. Lowther, Dec. 1st; Lt. W. C. Bagnall, Dec. 9th.

Lt. F. M. L. Watts, M.B.E. (Lt., Worc. R.), resigns his commn., and is granted rank of Capt., Dec. 17th.

Sec. Lt. W. L. Rennie (Sec. Lt., Ex. Reg. Empld. List) resigns his commn., Dec. 17th.

The notification in "Gazette" of Nov. 4th concerning Lt. A. E. Burton is cancelled (notification in "Gazette" of Nov. 25th to stand).

The notification in "Gazette" of July 15th concerning Capt. A. P. Thurston is cancelled.

MEDICAL BRANCH.—Flying Officer J. Prendergast to be Flight Lt., Nov. 22nd.

Wing Comdr R. H. Mornement, O.B.E. (Surg. Comdr., R.N.), relinquishes his temp. R.A.F. commn. on return to Naval duties, Oct. 30th (substituted for notification in the "Gazette" of Nov. 7th).

Flight Lt. J. D. Bangay (Surg. Lt., R.N.) relinquishes his temp. R.A.F. commn. on return to Naval duties, Dec. 8th.

Flying Officer H. J. Swan relinquishes his temp. R.A.F. commn. on expiration of contract, Dec. 8th.

Transferred to the unempld. list :—Capt. F. C. Morgan, Oct. 25th; Capt. C. L. McDonogh, Nov. 20th; Capt. J. P. Doyle, Nov. 28th; Capt. T. M. Davies, Dec. 7th.

The notification in the "Gazette" of Nov. 21st concerning Capt. L. A. Walker is cancelled

DENTAL BRANCH.—Capt. C. Murray-Shirreff is transferred to the unempld. list, Nov. 26th.

MEMORANDA.—The following Overseas Cadets are granted temp. commns. as Sec. Lts., with effect from Feb. 15th, and relinquish such commns. with permission to retain the rank from the day following termination of the standardised voyage in the case of those claiming immediate repatriation, and from the day following demobilisation in England in all other cases :—779037 F. W. Brown; 2043071 C. E. Chown (substituted for notification in the "Gazette" of June 13th, wherein this Cadet was described as 316244 E. E. Chown); 120556 W. T. Eberwein.

The following Cadets are granted hon. commns. as Sec. Lts. :—250308 G. Tatham, March 3rd; 137186 S. M. Doutbwaite, March 13th; 4650 J. W. Sparrow, April 2nd; 3190 1 R. B. Oliver, May 5th.

The following Proby. Flight Officers are granted hon. commns. as Sec. Lts. :—M. Jarman, Jan. 23rd; H. Cadman, Jan. 24th; O. Entwistle, Jan. 25th; T. H. Hutchison, Feb. 1st; A. A. Goodale, Feb. 8th; L. C. Letts, Feb. 10th; F. W. Halliwell, R. M. Harvey, Feb. 18th; O. V Eales, Feb. 20th; R. H. Kimber, Feb. 28th; C. A. Leggatt, March 5th; J. W. Locke, March 8th; G. N. Dawson, March 9th; R. T. Cunningham, G. D. Haggart, March 22nd; W. H. R. Lukey, April 4th; E. Heron, April 10th; G. E. James, April 12th; J. W. Cross, April 17th; H. J. Greenland, May 7th; D. K. Falkner, Aug. 30th; R. Wincup, Sept. 16th

Lt. C. O. Steel relinquishes his commn. on ceasing to be empld., and is granted the rank of Maj., May 1st.

Transferred to the unempld. list :—Maj. A. B. Ennis, from (S.O.), Nov. 26th; Lt. D. N. Thomson, M.C., from (S.O.), Dec. 3rd; Lt. J. J. Yates, Dec. 7th.

The notification in the "Gazette" of June 6th concerning Lt. C. O. Steel is cancelled.

The notification in the "Gazette" of July 29th concerning Capt. C. W. Wise, M.C., is cancelled.

The notification in the "Gazette" of July 1st concerning 184026 Cadet C. E Jones is cancelled.

The notification in the "Gazette" of Oct. 28th concerning 9438 Cadet T. S Duncannon is cancelled.

PERSONAL NOTICES.

NAVAL.

MARRIAGE.

ALLSOP—HUBBARD.—On Dec. 4th, at the Chapel Royal of the Savoy, Major John William Kidston Allsop, late R.N.A.S., attd. R.A.F., son of the late T. W. Allsop, Esq., and Mrs. Allsop, of Langland Mansions, Hampstead, was married to Frances, daughter of the late C. W. Hubbard, J.P., and Mrs. Hubbard, of Riversdale, Sleaford, and granddaughter of the late W. Bedford, J.P., of Allan House, Boston, Lincs.

MILITARY.

MARRIAGE.

WILSON—BRIDLE.—On Dec. 18th, at Epsom, Capt. George Ferguson Wilson, late of Seaforth Highlanders, attached to R.A.F., was married by licence to Mrs. Wilhelmina Margaret Bridle, younger daughter of Mr. and Mrs. T. O. L. Becker, of "St. Goar," Barnet Wood Lane, Ashtead, Surrey.

AIR FORCE.

DEATH.

COCKMAN.—Lieut. Charles Burton Blenheim Cockman, R.A.F., who was accidentally killed at Ramleh, Palestine, on Dec. 10th, was the son of Commander George Wallace Cockman, D.S.C., R.D., R.N.R. He was 22 years of age.

MARRIAGES.

BELLORD—CARDEW.—On Dec. 9th, at St. James's, Spanish Place, Capt. Cuthbert George Bellord, late R.A.F., elder son of Mrs. E. J. Bellord, Hampstead, was married to Margaret Isabel, elder daughter of Sir Alexander Cardew, K.C.S.I., and Lady Cardew, by Monsignor Smith, D.S.O.

GREENWOOD—FAVREAU.—On Nov. 19th, in the Cathedral, Calcutta, Lieut. Eric M. Greenwood, R.A.F., son of Dr. and Mrs. George Greenwood, of Goswell Road and Harrow, late of Enfield, was married to Jeanne Edith, only daughter of the late M. and Mme. George Favreau, of Rochefort-sur-Mer, France, by the Bishop.

BIRTHS

DICKINSON.—On Dec. 15th, at "Mairyshade," Gerrard's Cross, to Janet, wife of Capt. C. J. Dickinson, late R.A.F.—a daughter.

GILL.—On Dec. 12th, at 38, Portland Street, Leamington Spa, Daisy, the wife of Lieut.-Col. N. J. Gill, R.A.F., of a daughter.

The most quickly Detachable Plug yet made

This plug can be taken apart, cleaned, and re-assembled in a few minutes without mistake. Only one nut to slacken off and every part becomes accessible for cleaning purposes.

OLEO

No. 7.M. DETACHABLE PLUG.

Designed to stand up to the severest tests and to be free from pre-ignition, providing it is periodically taken apart and cleaned. No trouble with oiling up or incandescent points. Made to Standard dimensions. Mica Central Insulator. ½" reach Metric thread. Barrel ⅝" long. Standard size hexagon. Length 2⅛". Weight 3½ ozs. Single point. Non-leaking and of the finest workmanship throughout.

Price: Steel, 5/- Brass, 5/6

U.S.A., 1 Year, $8 50c.

ON THE PARIS AERO SHOW AND THE FUTURE OF AVIATION.

Indubitably there is a Special Providence which looks after children, drunkards, Englishmen, and other people of obscured intellect. Or else the English are the Chosen People of our epoch. In the days of one's childhood one was always puzzled as to why the Children of Israel were the Chosen People of their day. Their manners and customs as depicted in the Old Testament gave one to think that the choice indicated a lack of taste. Very similarly the English of to-day cause a mild wonder as to why they have been chosen. Yet there is no doubt about their being the elect.

By all the laws of common sense, commercial enterprise and business initiative, we in England should have held an aeronautical exposition late last Autumn—at the close of a highly successful season of pleasure flying and in the full swing of a most promising series of flights between London and Paris, Brussels and Amsterdam. Or we should have arranged to hold one in March next, so that interest could be maintained during the Winter in the designs and trial flights of the aeroplanes and aero-engines of 1920.

Instead of which the Society of British Aircraft Constructors fixed on July of next year as the date for the first British Aero show since the war. And our friends the French led the world, as usual, by organising an impressive and elegant exhibition in Paris at what seemed to be the best possible moment.

A Successful Failure.

As the result of some time spent at the Paris Aero Show one is forced to believe that the Special Providence before mentioned which looks after Englishmen, etc., etc., has again led the Chosen People in the right, albeit the longer path, and that it is an excellently good thing that we did not hold our own aero show earlier than the French show. For, sad to say, there is no doubt that, considered as a business exhibition, the Paris Aero Show is a failure.

Considered as an exposition pure and simple, it has been a great success. The organisation has been of the finest. The arrangement of the stands and of the signs pertaining thereto has been made with that artistic genius which is of the most French. The aeroplanes themselves and the aero-engines are splendid examples of good workmanship and detail design.

But there has been no business doing. The World is not yet ready to buy aeroplanes. The exhibition was premature.

As aeronautical propaganda, as an educative influence, as an indication of the future, the Paris Aero Show has been of very great value. As a means of bringing orders and money to the French Aircraft Industry the Show has been a failure.

It was not surprising to find among one's friends in the French Industry an air of "*Morituri te salutant.*" The general feeling seemed to be that this was the last expiring effort of the French Aircraft Constructors, and that if they had to die they would at least die gloriously.

The Disease of the French Industry.

Personally one is far from believing that the French Industry is on the verge of death. One knows the vitality and the recuperative power of *la belle France* too well to think that the Industry in which she led the World from 1909 to 1914 will die a natural or unnatural death in 1920. The nation which survived Charleville and Maubeuge and revived for the battle of the Marne in 1914 cannot let its Aircraft Industry die. Yet undeniably the French Aircraft Constructors are in a bad way, both for lack of business and for lack of genius, or even talent, among their designers.

Judging from what one saw in Paris, the French Aircraft Industry has suffered more from official interference than has the British Industry. There was hardly a French aeroplane in the exhibition which showed originality in general lay-out or in aero-dynamic design. All the machines were good sound examples of very ordinary design and construction. All were good. Few were striking. And none inspired that admiration for originality which one has felt at earlier shows in Paris.

All originality seems to have been crushed out of the French Aircraft Industry either by commercialism—which has prevented the war-profiteers from spending their profits on experimental designs—or by Chalais-Meudon, the French equivalent of what our Royal Aircraft Factory used to be—which refused during the war to sanction or adopt any new design which threatened to be better than its own products or to contradict its own theories.

The great lesson of the Seventh Aeronautical Exposition in Paris is that we in England have much for which to be thankful.

The Brilliant British Exhibits.

Those British firms which had the pluck and energy, and the financial strength, to exhibit their machines in Paris have not only sown seed from which they will reap a rich harvest in time to come. They have in fact conferred a lasting benefit on British Industry in general and on the British Aircraft Industry in particular. Their exhibits were in fact the best things in the whole show, for they displayed originality of idea as well as excellence of workmanship and aero-dynamic design.

The great "W.8" Handley Page, with its striking placard announcing that it had "made the traject" from London to Paris in 1 hour 50 minutes of "real flight" impressed everybody with the neatness of its design and the luxury of its accommodation, and with the power of its Napier engines. It was the *clou* of the show, and a queue of hundreds of people passed continuously across the stand to gaze into the elaborate interior of the saloon.

The Airco stand, displaying elegance of arrangement

as a whole, exhibited a beautifully finished "Airco 16" with a Napier engine to the best possible advantage.

The Bristol stand, with its Cosmos-engined "Bullet," its Puma-engined "Tourer," and its Siddeley-engined "Babe" had a business-like appearance which was most impressive, and showed well the cleanness of Captain Barnwell's designs.

The Vickers stand, despite the disaster of the Viking smash, showed by means of models of machines designed by Mr. Pierson, by the passenger compartment of a "Commercial Vimy," and by a number of parts and fittings, the capabilities of the great armament firm.

The Westland Co.'s "Limousine," with its Falcon engine, taught a useful lesson in the art of designing a comparatively small machine expressly for passenger-carrying so that it shall be really efficient, and it indicated the high place of Mr. Bruce among aeroplane designers.

And the all-steel Boulton and Paul biplane displayed Mr. North's originality of idea and sound mechanical knowledge in a way which should be a pattern to future exhibitors. Incidentally, so far as one could see, it was the most advanced example of constructional thought in the whole show.

The Detailed Report.

With such exhibits as these the Society of British Aircraft Constructors was thoroughly well represented. One only wished that there had been more of them, so that the superiority of British aircraft over all competitors could have been more fully demonstrated. The British Industry owes these firms a permanent debt of gratitude for thus worthily upholding the honour of British commercial enterprise and engineering ability.

All these machines, together with their French and Italian competitors, will be illustrated and described in detail in this paper in the first weeks of the New Year, for, owing to the duration and effects of the Christmas holidays this year, it has been a mechanical and physical impossibility to get a full report of the Paris Show into print at an earlier date. One believes that the details of the exhibits will be found both educative and entertaining, and those who wish to read of and see them will do well to make sure beforehand of getting examples of this paper, for in these hard times supplies are limited strictly by the demand.

Polyglot Purchasers.

Given that the French Industry is as indicated hereinbefore, it seems worth while to consider the developments of aviation next year as they appear in the light of present knowledge.

There were foreign representatives in plenty at the Show, but they were not buyers. They were there to see what is being done by the more advanced nations, both in the construction and operation of aeroplanes. They will not buy till they see how our own experiments in running air-lines pay us.

There were Chinese, Japanese, Tonkinese, Javanese, Brazilians, Chileans, Peruvians, Colombians, Argentinos, Norwegians, Swedes, Finns, Poles, Jugo-Slavs, Czecho-Slovaks ("and Stumer Czechs," as a cynical Englishman remarked), Roumanians, Transylvanians, Greeks, Hebrews (quantities), Ephesians, Corinthians (and all the other people to whom St. Paul addressed his circular letters), and, in fact, representatives of every nation, self-determined, undetermined, undermined, or indeterminate, of which Prophet Wilson of the League of Nations ever dreamed in his most dyspeptic nightmare. But they were not buying aeroplanes.

Before they buy they will have to be shown that aeroplanes are reliable, that aeroplanes are safe, and that aeroplanes pay. We have already demonstrated all those things to our own satisfaction in this country. But we shall have to demonstrate them abroad before the buying begins.

When we have satisfactory mail lines running between Rio and Buenos Ayres the whole of South America will begin to buy. When we have flying-boat lines running up the great rivers of China, all China will begin to buy. When we have a Cape to Cairo line running, private enterprise will organise air lines all over South and Central Africa. But not till then.

Prospects for 1920-21.

Between now and next June many of these lines should be running with some regularity. And so, by next July, when the British Aero Show is to be held at Olympia, it is possible or even probable that there may be the beginning of a real market in aeroplanes. If so it will mean a slight revival of activity in aeroplane construction during the winter of 1920-21, and quite a busy year's flying in 1921. After which the Aircraft Industry, now in the deepest depths of the worst possible slump, may begin slowly to climb again towards the peak of a new boom.

For one thing we may, at any rate, be thankful, and that is the fact that we have at last finished with the year 1919, a year to which few will look back with any gratitude or pleasure. It has been a year of disillusionment, of exposed scandals, of disappointment, and (to many) of catastrophe. It has been the year in which befell that which Lieut.-Col. Mervyn O'Gorman, two years or so ago, so wittily and so philosophically called "the cataclysm of a devastating peace." Let us hope that the future holds for us war, if only a war of commerce, for by strenuous effort alone can strength come to us.

Perhaps the wish is father to the thought, but that at any rate is how the situation appears when regarded from here. It will be interesting to see how it works out in practice. Meantime, the British Aircraft Industry is in a very much better position than that of any other country. But that is thanks rather to the goodness of our Special Providence than to any special pro-vidence on our own part.—C. G. G.

THE UNDER SECRETARY OF STATE FOR AIR.

It is stated officially that Major G. C. Tryon, M.P., has been appointed Under Secretary for Air in succession to Major-General the Right Hon. J. E. B. Seely, C.B., D.S.O., M.P., resigned.

THE PRIX MICHELIN.

Recently, it was stated that M. André Michelin, whose motor tyre manufactory has brought him wealth, had founded a prize of 500,000 francs (normally £20,000) for certain aeronautical performances. The regulations have now been issued by the Aéro Club de France. They are briefly as follows :—The winner is to be the first aviator who (i) flies from a point within 10 kilometres of the Château de Versailles to Reims Cathedral and circling that building returns to the starting point in less than 1 hr. 15 min., having maintained a speed of not less than 200 kilometres an hour (roughly, 124 miles an hour); (ii) and then without landing flies in one hour at a height of 100 metres (375 ft.) a distance of not more than 10 kilometres (6.2 miles) rigorously following a course which is defined as the interior of the perimeter of an equilateral triangle, each side of which is 3 kilometres 600 metres long. This must be done with the aeroplane in its normal flying position. (iii) The landing at the conclusion of these tests must be made in a space of 5 metres (16 ft. 3 in.) from the time any part of the machine touches ground, and without serious damage to the aeroplane. During the landing the normal flying position must be maintained.

These regulations are not lacking in rigour, and though they may initially rejoice the heart of the undertaker, yet aeroplanes capable of winning the prize will be a great advance on any machine in existence to-day.

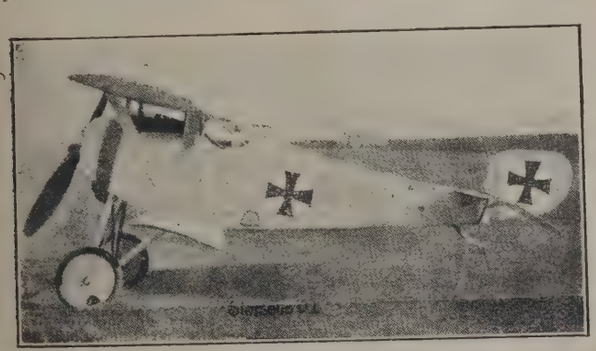
The prize is strictly reserved to French aviators. French aviators owe a great deal to M. Michelin for his enlightened support of the science which gives them the right to exist.

THE AIR ESTIMATES—(*Continued.*)

[The following is the continuation of Mr. CHURCHILL'S speech of Dec. 14th, the beginning of which was given last week.]

Everything possible has been done to strengthen the Air Ministry and lend body to the Air Force. The Technical Department of the Ministry of Munitions has been transferred from the Ministry of Munitions to the Royal Air Force. The meteorological research has been assigned definitely to the Air Ministry. Civil aviation has been rescued from the ambitions of the Ministry of Transport or the Board of Trade and definitely assigned to the Air Ministry. It will take, approximately, five years to bring the permanent post-war Air Force into the same kind of running order as were the pre-war Army and Navy.

Estimates have, accordingly, been worked out not for one year only, but for five years, subject, of course, to such modifications as may be found desirable.



The Royal Air Force is in want of practically every permanent institution of a disciplined service. Therefore, at the outset schools, colleges, training centres, experimental establishments of many different kinds have to be called into being and organised. My right hon. friend (Mr. Lambert) thinks that because the Navy will not be training for the next two years so many officers as it was before the War there will be a certain number of beds vacant at Dartmouth and Osborne, and he thinks that these extra places in the class rooms and the vacant beds in the dormitories may be made the birthplace, the cradle of this great new Air Force of the future.

I do not think my right hon. friend's suggestion is practicable. The Air Force must have establishments of its own. I do not think you will ever build up a proper Air Force if you are to occupy any spare accommodation which may be found from time to time available in buildings at Dartmouth or elsewhere. We have to have these establishments for the Air Force. The cadets have to be trained to be officers, and the officers have to be trained in the different specialised branches of their profession, and those branches involve the studying of the special needs of the Army, the Navy, and the Independent Service. Officers have, further, to be trained to become air staff officers, to understand not only air warfare as such, but air warfare in combination both with the special and general requirements of the Army and the Navy. Mechanics have to be trained from boys upwards in all the different trades, some highly scientific trades, on whose trustworthiness the Air Service depends for its efficiency and the flying men for their lives. At Cranwell we shall have the Air Force Sandhurst. At Halton there will be the Air Force staff. At Halton also there will be the main training establishments for mechanics and artificers, similar to those which the Navy had before the War on board certain ships. The photographic establishments will be at Farnborough, and the main wireless schools at Flowerdown. The gunnery school will be at Eastchurch. There will also be a navigation school. There will be three store depots and two aircraft repairing depots, one at Kidbrook, and the other at Donnibristle. All these establishments exist at the present time.

During the next three years we have to spend a considerable proportion of our limited funds available for maintaining the Air Force on bricks and mortar. That is to say, we have to replace the temporary buildings which can be used at the present time by permanent structures. Practically no new construction of aircraft is required except for experimental purposes. We shall continue repeatedly to experiment in type, each type an improvement upon the other, but we do not require any bulk production in the next two or three years in aircraft. We have left over from the War an enormous accumulation of stores and aircraft.

The £15,000,000, which is the approximate figure, includes £2,000,000 for research and civil aviation. That amount will be provided for in next year's Estimate. We are allocating £500,000 in the present year, and we have spent £329,000 on civil aviation in the present year.

Out of the £15,000,000 we are providing £2,000,000 for research and civil aviation. Here let me deal with those people who say, "It ought to be the other way round. You ought to provide £13,000,000 for research and civil aviation and the other £2,000,000 should be good enough to manage your military affairs." I must remind hon. Members that we have still an Empire to defend. Odd as it may seem on the morrow of unheard victories, we have all those dependencies and possessions in our hands which existed before the War, and in addition we have large promises of new responsibilities to be placed upon us. The first duty of the Royal Air Force is to garrison the British Empire. Out of the twenty-four and a half fighting squadrons which the Trenchard memorandum contemplates forming at once, no fewer than nineteen are abroad, or will be stationed abroad. Eight will be in India, seven in Egypt, three in Mesopotamia, and one is to be split up between the various naval bases. The maintenance of all these forces permanently abroad, the training of officers and men, the regular circulation of the units on the roster between home and abroad—because we intend to preserve the regimental idea very strongly in regard to the fighting squadrons of the Air Force—all these functions in the Air Force as in the Army will be found to absorb the greater part of the modest sum at our disposal. When to these are added the two fighting squadrons which are all we can maintain at home and the two and a half squadrons which will be working with the Navy, and the one which will be working with the Army—I am supposed to be exceptionally favourable towards the Army as against the Navy; but it will be seen that only one squadron is allocated to the military division as against two and a half allocated to the Navy—the rest of the force will be on independent duty abroad.

A Siemens Shuckert D.I Biplane.

When we have considered all those, and the necessary schools and the training and experimental centres and the general establishment charges, the whole of the available sum is absorbed with the exception of these £2,000,000. Necessity has to come first. The Royal Air Force is now reduced to the very minimum in finance which will enable it to discharge its peace-time military functions, and to have an integral independent life as a permanent Service. If, therefore, larger sums are required for civil aviation, as some are inclined to demand, additional money must be voted by Parliament. That must be faced. I do not myself believe that it is the business of the Government to carry civil aviation forward by means of great expenditure of public money. Our business is first of all to do all we can to facilitate the development of civil aviation, to develop the routes and the key aerodromes, to develop the legislation, to assist in all these ways which are open to a Government Department to advertise and push British civil aviation

We have at the head of civil aviation in General Sykes an extremely competent officer, who is throwing a great deal of personal ability into his task, and I feel with great confidence that his treatment of the problem of civil aviation from the Government point of view will be attended by the same measure of success as has attended Sir Hugh Trenchard's treatment of the military. As to the provision for the Navy very satisfactory relations have been established between the Air staff and the Admiralty. Admiral Beatty in particular has shown that he is a sincere friend and well-wisher of the Royal Air Force. I look forward to the most favourable results from his co-operation.

The Admiralty have not got what they asked for. We simply cannot provide the trained mechanics next year, even if the money allowed, to meet all requirements of the Navy any more than we can meet all the requirements of the Army. What we have to do is to get our system established, our training plans at work, to get our establishments in full activity for preparing the personnel of the new force. The scheme which is outlined by the Chief of the Air staff is the most which is physically practicable within the time and limits available. But I give the general assurance that the Air Ministry will do their utmost to study the special needs of the Navy and meet them in every possible way. Those who seem to think that we are immediately on the verge of some enormous development whereby battleships and surface craft will disappear and will be replaced either by a submarine Navy or an Air Force, or a combination of both, must realise that in proportion as such evolution obtains the support of professional opinion, in that very proportion the large funds which are now spent on the construction of a surface Navy will be liberated and be available for the development of additions to the Air Force.

But the task before us is severely practical; we have to find the necessary air garrisons to defend the British Empire, to create a permanent independent Air Force, to offer young officer airmen or mechanics a decent regular life in a good profession to which it is an honour to belong. This is a task which is self-contained and must be discharged quite apart from any theoretical decision either for revolutionising either the art of war or for the combined organisation of the three Services. It would be a great mistake to delay the practical steps which are needed until an entirely new system of defence organisation has been thrashed out and developed. To make it a unit, to make it in a form where it is not only efficient in itself, but will fit into a higher organisation—that is the practical task on which we are engaged. But if the Air Force is to be independent of the other two Services it must also be interdependent upon them. It must be so organised as to fit naturally and easily in peace or war into a combined organisation of defence. It must be that for its own sake, in the interests of the other Services and in the general interests. Take the case of officers of the Air Force, for instance. Every Service must offer a reasonable advancement to young men who enter it, but a boy entering the Air Force ought to have as good a chance as a boy entering the Army or the Navy of making a career for himself. But as the proportion of general officers during the flying period of their lives in the Air Force necessarily exceeds very largely the proportion of higher posts, therefore we have to turn to the two great Services to assist us, and we have to adopt a system of temporary commissions. About 50 per cent. of the Air Force will be composed of its own officers in permanent commission, 40 per cent. will be the short-service commissioned officers, and 10 per cent. will be birds of passage from the two other Services It may be in future years that it will be still further extended.

It is good for us because it reduces *pro tanto* the pressure of candidates on the limited number of higher appointments. It is good for the other two Services because it familiarises them with the air, and later on it will give them the higher officers who know the true value of the air arm. It is good for all because it tends to promote that solidarity and unity with regard to defence organisation which is more and more demanded by those who are thinking out these problems, and it tends to eradicate the absurdity of mere departmental conceptions of war. Meanwhile the Air Force is dependent upon the Army and Navy for certain proportion of the officers who will be flowing through it. There are certain subsidiary services which the Army and the Air Force can have in common. For instance, we have arranged to have the mapping Department in common. The rations are supplied to the Air Force by the Navy and Army and not purchased direct by the Air Force. The Air Force clothing is bought from the Army Clothing Department at Pimlico. The ordnance is supplied by the Army. The Air Force has its own technical supply, but in these more simple forms of supply there is not the slightest reason why purchasing should not be made through the existing organisation of the Army. The medical service is at present entirely separate. The chaplains' department is separate. It requires careful consideration as to whether it is necessary or proper to continue to duplicate any of these services. All this ground has to be very carefully studied in order—first, to secure the independence of the Air Force; second, not to waste money in duplicating organisation; and, third, not to take any steps inconsistent with the future combinations of the three fighting Services on the basis of common departments for common services. There is no doubt that very large economy and simplification would result from the combined treatment of defence problems, instead of having, for instance, two or three organisations. Instead of having two or three organisations for buying meat and bread, you would have one for all. Instead of three finance and contract branches, you would have one for all. Instead of three medical departments, three sets of hospitals, and three chaplains' departments, there would be one. These are very revolutionary ideas, and progress

towards them can only be made gradually; but progress towards them must be continued, and nothing must be done in reconstructing the Air Force which in any way conflicts with the final system to which we will certainly be drawn by logic, by economic and by war efficiency, and, in fact, by everything except existing vested interests, namely, a combined general Imperial War Staff for the three Services, actuating and operating under single control.

I hope that the discussions which are now taking place between the professional heads of the three Services, the First Sea Lord, the Chief of the General Staff, and the Chief of the Air Force, may be productive of real advance in this most urgent and important matter.

Here a word as to the position of the professional head of the fighting Services. I consider that in practice the control of the fighting Services is best exercised through the close co-operation of a Cabinet Minister and the professional head, who should be the principal soldier, the principal sailor, and the principal airman of the day in the fighting Service. As long as that arrangement works well everything works well, and when it breaks down the personality should be changed either in one direction or in another. This close co-operation involves almost daily intercourse between the Minister and the professional heads. It is not possible for the Under Secretary to be the channel of all communications passing between the professional head of the Service and the Minister responsible. It has never been so at the War Office or at the Admiralty. The First Lord must deal with the First Sea Lord; the Secretary of State for War must deal with the Chief of the Imperial General Staff; and, similarly, whoever holds the seals of the Air Ministry must deal with the chief of the Air Staff. It is the chief of the Air Staff who is the one to insist on his right of direct access to the Minister responsible, for otherwise everything would have to be taken once to the Under Secretary and then again to the Minister who had to decide.

I have never reproached my right hon. friend. Having held very high offices, as he has done in the past, and having exercised great responsibilities in peace and in war, it was difficult for him to accept frankly the position of an Under Secretary.

The view I take is this: that the initiative in Service matters must in the main come, and as a general rule comes, from the professional head. He plans, he outlines, he proposes. The Minister examines, criticises, suggests, discusses with his Board or Council, and finally approves. It is not possible for the initiative in such matters to come from the Parliamentary Under Secretary, and it would not be fair to the professional head of the Department, nor would it be wise, nor would it work in practice.

Sir DONALD MACLEAN followed Mr. Churchill, and, after the usual protest against the dual Secretaryship, said:—

The Secretary for War has taken great credit to himself and to his Department that this is the only one of the three great Services which has effected a reduction, and he has told us, with great frankness, that the real reduction is to £60,000,000. What will an anxious public think when with a shock it comes to know that the Air Force was to be maintained during the current year at an expenditure of £66,000,000, and to what extent will it be satisfied when this splendid campaign of economy has reduced the total to £60,000,000? We know that the anticipation is that next year there will be an expenditure of £15,000,000 only. To my mind that very remarkable drop, which we hope will appear next year, shows that during this year, at any rate, there must have been gross mismanagement and gross extravagance.

Mr. CHURCHILL: I must apologise for intervening. I meant to give the figures in my speech. Let us take £15,000,000 as representing a normal year. The difference between that and the present expenditure is £39,000,000. Liquidating war contracts and equipment, apart from the Ministry of Munitions, accounts for £12,000,000; liquidating works, £3,000,000; decrease in maintaining war force above the normal amount accounted for £4,000,000; war gratuities accounted for £5,000,000; the pay of abnormal numbers above what will be maintained next year, due to the military situation, accounts for £12,000,000; minor miscellaneous items account for £3,000,000. That gives a total of £39,000,000, all accountable to pure and definite war charges and war necessities, and not in any way attributable to mismanagement.

The reply did not satisfy Sir DONALD MACLEAN, who concluded his speech on a note of plaintive reproach.

On the vote for Quartering, etc., Captain BENN asked if it was not true that a new uniform had been issued to the W.R.A.F. a few days before its final demobilisation. Mr. CHURCHILL said, in reply, that the demobilisation had been carried out more quickly than was expected, hence it was unavoidable that unnecessary kit had been issued.

Technical and Warlike Stores.

On the vote for Technical and Warlike Stores, Captain BENN again began the attack, and after a few words about necessary checks on the use of mechanical transport, suggested in regard to the item of £25,000 devoted to inventions, that personnel in the Services often thought of small improvements, but there was sometimes difficulty in getting these inventions considered. He wished to know whether these ideas could be forwarded direct to an independent person. [That generally means someone who knows nothing of the Service.—Ed.] He also desired to hear about civil aviation.

Mr. CHURCHILL did not think it desirable that officers in full-time Service should receive monetary rewards for any improvement they may invent in the course of their work. Any great or novel invention would receive adequate reward.

[After all, it is the Service which gives the average officer the knowledge and opportunity to make inventions.—Ed.]

Captain BENN intervened to say that he was not asking for monetary rewards, but for the devising of some scheme by which officers' inventions should achieve due decognition.

The SECRETARY OF STATE said he knew of no disposition to snub officers and men who put forward useful ideas.

With regard to mechanical transport, I am satisfied that the reduction of motor-cars now has gone down to the very minimum compatible with the ordinary carrying on of the duties. Some people have the idea that one of the great ways of achieving economy is to reduce motor-cars and to walk instead, or go by train, and others think that if you can get the use of the telephone reduced or shorthand-writers retrenched you will in that case succeed in effecting great economies. If people who are dealing with matters of great consequence write their letters in their own hands instead of dictating them, walk to their business instead of riding, and send a message instead of speaking through the telephone, some people think economies will result, but, as a matter of fact, very few suggestions are less helpful than these.

So far as the mechanical transport of the Air Force is concerned, I have not yet finally reached a conclusion as to what extent we can pool with the Army. . . .

The mechanical transport Repair Department at Shrewsbury, which is under the control of the Royal Air Force, we hope will be wound up and handed over to Slough, which, although it has been frequently abused in this House and out of it by ignorant persons, is increasingly establishing itself as a paying asset in the State and is vindicating in a most conclusive manner the wisdom and foresight of those concerned in its initiation. As far as civil aviation is concerned, I have the figures here. I said the total was £329,000, and these are the principal items: Meteorology, £25,000; pay (salaries), £39,000; air routes, Cairo to the Cape, £50,000; Karachi to Australia, £40,000; purchase of land, etc., £50,000; minor new works, £25,000.

Major-General Sir NEWTON MOORE: Is there any provision for a route beyond Karachi? Is there any provision for acquiring land at either of the stations that would be required between there and Australia?

Mr. CHURCHILL: Oh, yes. This present flight to Australia has been done along a route which the Civil Aviation Department of the Air Ministry has been prospecting and developing.

Only one machine has so far got through, but the trail has been blazed, not only as far as Karachi, but right away through to Australia. I think the best part of the route will be the Cairo, Baghdad, Karachi route, and there, anyhow, you will have large air establishments for fighting or strategic purposes, and it ought to be possible on a first-class route, with aerodromes and so forth, for large commercial craft to make their way. The Cape to Cairo route, on which £50,000 has been spent, is now practically complete, and I could arrange for hon. Members who might be interested to see a roll or a chart as long as from here to the door, showing them all the stations throughout the whole of that route, where there are landing grounds, with dumps, etc. The present state of the scheme is this, that we want an incentive from South Africa as great as was offered by Australia to induce the civil aviation interests in this country to compete in the Cairo to the Cape flight, and I do think the great millionaires of the Rand might well make the offer of a prize equal to that which was given by the Government of Australia, and so offer an incentive to use this route. The route will be kept up by the different local Governments through which it passes. . .

Sir N. MOORE: Where you pass over Dutch territory, for instance, have any arrangements been made with the Dutch Government? . . .

Mr. CHURCHILL: I can only say that it is for the Controller-General of Civil Aviation to do his best to smooth away the difficulties. . . .

Works, Buildings, and Lands, and Air Ministry

In the discussion on the Works, Buildings, and Lands Vote and Air Ministry Vote, questions were asked by Captain Benn and Lieut.-Commander Kenworthy, none of which were of either general or aeronautical interest.

Miscellaneous Effective Services.

Captain BENN, who this day was filled with the inquisitiveness that endears children to their relatives, asked whether the Meteorological Office was completely under the Air Ministry. He thought it should be, as aviators must know more about the atmosphere than other people. They should, he thought, supply information to the other Services.

Mr. CHURCHILL: The intention is that the meteorological staff and all investigations into that branch shall be brought, in practice, under the Air Ministry. It is said that the eye of the master maketh the horse fat. No one has an interest in meteorology comparable to the Air Ministry. . . . It is following a perfectly logical and defensible principle to confide the charge of that matter entirely to us.

Lieut.-Colonel MOORE-BRABAZON asked why the charge for Meteorology appeared under civil aviation, and was told that "civil aviation this year has not been able to spend the modest sum allotted to it." If money ran short the charge would be transferred to the military side proportionately to the service rendered.

The Second Day.

The Report Stage was taken by the whole House on Dec. 15th, and the resolutions passed at the first sitting were read a second time.

On the first resolution—as to pay of the Royal Air Force—Mr. HOGGE, whose permanent worry in life is the pensions and gratuities of "other ranks" in the Services, said that though the allotment of Service gratuities on discharge amounted in the case of officers to £3,000,000 that for other ranks was only £2,100,000. He said that he understood that there was a larger proportion of men to officers in the Royal Air Force than in the Regular Army. [Here he is entirely wrong.—Ed.] He knew that the basis of officers' gratuities was 124 days' pay for the first year of service and 62 days' pay for every successive year or part of a year. He thought that "other ranks" should receive gratuities on the same basis.

The SECRETARY OF STATE said that the Government had no intention of altering the present system. About £5,000,000 had already been paid to officers demobilised from the Royal Air Force. In reference to the comparative numbers, he said that "in the Army the proportion of officers to men was nothing like so high as in the Air Force. There were nearly 25,000 officers in the Air Force at the conclusion of hostilities. I do not think the number of men exceeded 200,000."

On Captain BENN asking if the Government would state their policy as to the making of more non-commissioned pilots as is the custom abroad, and the use of officers as observers, Mr. CHURCHILL said that he could not intervene, as the House was not in Committee.

FLIGHT WITH ECONOMY

THE

Sopwith

Aviation and Engineering Co., Ltd.,

has designed and is building

Three New Types

TRANSPORT.—Single-engine, long distance, high-performance, weight-carrying utility aeroplane, carries six passengers or cargo.

GNU.—High-performance, enclosed cabin, three-seater.

DOVE.—Very fast sporting two-seater.

Appointments for Demonstration Flight and further particulars on application.

The Sopwith Aviation and Engineering Co., Ltd., originators of the high performance wide-speed-range biplane, has designed a larger number of types, which have been accepted and standardised by the British Government, than any other aircraft manufacturer Its enormous works have been devoted exclusively to the production of its own machines, which have been also made in huge quantities by sub-contractors. Its designs have been made in great numbers by the French Government and also for the American Government, and have been also used by the Italian, Russian, Greek and Roumanian Forces

THE SOPWITH "GNU" 3-SEATER.

IT IS PREPARED TO DESIGN AND BUILD THE BEST AND MOST EFFICIENT UTILITY MACHINES (SEA OR LAND) FOR ANY SPECIFIED SERVICE AND PERFORMANCE.

At this point the Irish members began to take a part. As a result of their dissatisfaction at the suppression of the "Freeman's Journal" they endeavoured by means of the time-honoured "talking out" method to delay the proceedings of the House in order to prevent the Irish Education Bill being taken during the day. Hence, it is not one's intention to deal at any length with the Irish speeches save where they accidentally touch on matters of importance to aviation.

After a series of speeches by Mr. KELLY, Mr. DEVLIN, and Captain REDMOND, the questions in which were mostly disallowed by the Speaker, Mr. CHURCHILL, with some courtesy, gave a general reply, in the course of which he said that the W.R.A.F. had been reduced to 200.

On division the House agreed to the resolution.

Supplies and Transport.

The Second Resolution was then read a second time. Mr. KELLY again spoke. He argued that scavenging, sanitary services, etc., should be done by R.A.F. personnel as punishment fatigues in order to save public money passed in payments for civilian labour. He also thought the large clothing charge was due in great part to the frequent changes in uniform made in the past 18 months.

Capt. BENN wished to raise the question of the Medical Services. The medical conditions in the Air Force were essentially different from those prevailing in other services. The French and Italians had done much good work in this direction, and at Padua a large laboratory had been opened for the purpose of instituting accurate tests in respect of people applying for commissions in the aerial arm. He wanted to know if Col. Flack's work was being encouraged.

Mr. HOGGE spoke of houses and clothing, and Mr. DEVLIN was interested in the £1,000 set aside for the purchase and upkeep of horses. Captain REDMOND also showed interest in all these subjects, and in addition wished to know

what is meant in regard to the medical services referred to and the hospital charges in respect to the Army and civil hospitals of £150,000? Has the right hon. gentleman created any new hospitals? Where are these hospitals? Are they in Edinburgh, London, Dublin? All that we are told in this White Paper in relation to the medical services is Item No. 2 Hospital: charges in respect of Army and civil hospitals, £150,000. Is the right hon. gentleman subsidising existing hospitals?

To all of which Mr. CHURCHILL replied.

The £1,000 alluded to here is for horses required in respect of the area commands. There used to be eight area commands of the Flying Force in the United Kingdom in which horses were provided for the officers who had a war staff We have reduced these areas to two—the inland and the sea-board area. The officers have a pretty wide district to cover. They are often equivalent in rank to a general officer and in respect to the duties they have to discharge, and they have to get over a good deal of ground. Horses have been purchased, not mules or asses.

Mr. DEVLIN: The asses are all at the War Office?

Mr. CHURCHILL: I am not quite sure whether the field over which the asses roam is not wider than that. Observations like that carry one back to one's early school-days, when jokes of that kind about the possession of asinine qualities by particular individuals were expected to pass muster. So far as the medical services are concerned, the £150,000 is required to pay the hospitals on account of the disbursements to which they had been put. An airman ill or injured, where there is no other hospital, is taken to the nearest civilian hospital, and, of course, the bill comes in to us in due course.

Captain REDMOND: They are existing hospitals?

Mr. CHURCHILL: We are not building any new hospitals On the contrary, the process this year has been the closing of hospitals on an enormous scale. Then about the clothing. The hon. gentleman was surprised that £45,000 should be spent on clothing for the Women's Royal Air Force. Attention has already been drawn to the fact that this average for 9,000 women only works out at £5 per head, and that does not seem to me to be excessive for the requirements of a considerable number of females.

Mr. KELLY: Is it not £9 a head?

Mr. CHURCHILL: I am not strong at arithmetic, but I think that, as a matter of fact, five nines are 45.

Mr. KELLY: I beg the right hon. gentleman's pardon, I am wrong.

Mr. CHURCHILL: Then a word as to the clothing of the men of the Royal Air Force. In the middle of the war when the Air Force was formed into a separate unit a new uniform of khaki was adopted. Now that the war is over, it has been decided to make another change. It has been thought desirable to have a more modest and a more sober-hued cloth. It shows, however, the distinctive character of its design. This involves no additional expense, because we make the strictest rule that every officer has to wear out his old clothing, even the original khaki, before he adopts the new pattern. It is quite easy for the Air Force to do that, because they can keep their old uniform for the dirty oily work which has to be done in regard to aeroplanes.

In regard to the medical examination of pilots he said:

I have no reason to believe that the apparatus we have for this purpose in the Royal Air Force is in any way inferior to any apparatus in use in any other Air Force in the world. I can quite see that the medical service of the Royal Air Force, even if it should not be separated from the general medical service, must be a highly specialised branch, because the conditions require special aptitude, and we are all acquainted with the effect which flying produces on officers and men, and this makes it necessary that the medical service dealing with them should have had a specialised study of those conditions. Therefore I fully recognise that it must be a special branch of the medical service. . . .

The resolution was agreed to by the House.

Technical and Warlike Stores.

The third resolution was then read a second time.

Lieut.-Com. KENWORTHY was interested in the £25,000 set aside as rewards for inventions. He wished to know whether or not due attention was being paid to the helicopter. The French had done much in this way but he feared that "certain sections in the Air Ministry were lukewarm" in the matter.

[What, for instance, has the Personnel branch to do with helicopters?—Ed.]

In regard to kite balloons, he said:

I noticed in the "Times," under the title of "Naval News," an item to the effect that sloops proceeding to the China station were having their kite balloon winches removed and the old appliances replaced. That appears to me to evidence a very short-sighted policy. Every ship sent to China should be equipped with the latest anti-submarine devices, and certainly with the kite balloon.

Mr. HOGGE, among other points which were not clear to him, wished to know if the £25,000 for inventions was to be spent as awards to aviators or was to make provision within the Air Service for the testing of inventions submitted. If the latter arrangement was intended the sum seemed inadequate.

Capt. REDMOND, with much circumlocution that the business of the House might proceed slowly, asked if the £144,000 asked for was to cover the price of one airship only, and what was being done with the material purchased for other airships and deprecated the waste of the time and money expended on them. He was worried about the expenditure on the construction of aerodromes in Ireland at Tallaght and elsewhere. Why did they lay out aerodromes only to abandon them at a later date?

[Capt. REDMOND should not forget that a state of war existed between this country and certain foreign Powers from 1914 to 1919.—Ed.]

Mr. KELLY also spoke with charm on nothing for fifteen minutes.

Mr. CHURCHILL: As to the £25,000 for inventions, that admittedly is a small sum, but, in the first place, the Inventions and Research Department has only really begun to develop its station during the last few months. It is probable that more expense will be incurred on that account in later years. Also there are several important claims for inventions made during the war which are still *sub judice* and which are likely to mature, not in the current year but in the currency of the next financial year. I made a mistake a few minutes ago in saying that the Appropriations-in-Aid on Vote 1 of £450,000 was in respect of the airship. Of course, it had nothing to do with that at all. In the item "Appropriations-in-Aid, £545,000" on this Vote is contained money received on account of the airship that has been sold. We are endeavouring to dispose of all the airships, with the exception of three, which are reserved for certain purposes. We hope to sell them to a company which will take them over under certain conditions. The Government will participate in any advantages which are gained from their use. . . . .

I was then asked about the helicopter. There is no doubt at all that if civil aviation is to achieve really wide development, it must be through the agency of some quite different kind of aeroplane from that which is used at present. The great speed involved in landing aeroplanes at present, and the length of ground which they require to pull up in, will always invest with an element of peculiar danger that form of travelling. If this invention were successful, it would undoubtedly give us a machine which, if the engines stopped, would descend like a parachute, quietly and gently, and sit down on the ground without anyone being hurt. It would also give us a machine which would rise practically straight from anyone's back garden, and the extraordinary fact is revealed by investigation that it is by no means impossible, scientifically and theoretically, that the helicopter machine would not only rise and descend perpendicularly, but when it progressed laterally it would be capable under certain conditions of developing very great speed. It is true that the inventor, Mr. Brennan, who has been studying this for a very long time—I started him on it when I was at the Ministry of Munitions—does not make the claim in regard to great lateral speed, but some scientists who have worked it out theoretically think it is by no means impossible. However, progress has been disappointingly slow, and indeed we have not yet succeeded in making a machine which will ascend into the air, and the whole field is extremely speculative; but it is certainly a matter of very great interest, which should be pursued with the greatest energy by all who are interested in the future of civil aviation. . . .

The Resolution was agreed to by the House.

Works, Buildings, and Lands.

The fourth resolution on Works, Buildings, etc., was read a second time.

Major BARNES raised the whole question of the attempt to sell Lord Rosebery's land at Turnhouse Farm without consulting him in the matter. He said it was illegal even under D.O.R.A.

Mr. CHURCHILL, replying, said that the matter had been thoroughly thrashed out in the public Press. He held that the Government proceeded within the existing limits of the laws of the land. He proposed to let matters take their course. Tribunals already existed to protect the community from abuse and individuals from injustice.

This reply roused Mr. DEVLIN to make a long speech delivered with perfect elocution, protesting against the scandalous treatment of Lord Rosebery.

Mr. KELLY, tired of listening to others, and mindful of the necessity of obstruction, spoke again on works and buildings, and asked if Sub-head H, showing the incidental expenses of the "Air Ministry Estates," included estates in Ireland held by that department.

In Ireland some very fine land in and around Dublin belongs to the

Air Ministry, and a very valuable crop of meadow has been taken off it. I would like the right hon. gentleman to tell me if these lands are let or if they are used directly by the Air Ministry, and if any credits come to the Department from the use of them.

In the course of a further speech Mr. HOGGE said :

I want to ask something about paragraph (B). We sometimes find embedded in these Estimates a rather distinct Empire fact. The phrase used in paragraph (B) is "accommodation at stations on aerial route between Egypt and India, £50,000." What is that aerial route? Is it a route over British territory, or territory over which we have some protection? For what is it designed? Is it an Imperial venture, or has it anything to do with the situation of Egypt and India from the point of view of possible disturbances in either of those countries or in both at the same time? I suppose that the route must have been mapped out. Is it part and parcel of another route?

Mr. CHURCHILL : The hon. Member spoke first of the aerial route from Cairo to India. This £50,000, which is taken in the Vote this year, is only the beginning of the preparation for the aerodromes and accommodation which will be required at Cairo, at Baghdad, and at Karachi, the three main points on the route from Cairo to India. This is the most important section of the route from London to Australia, and it will come into existence as a going concern long before the other parts of the route are perfected. In the first place, it is in clear fine weather, where there are no clouds or disturbances such as affect flying enterprises in these islands. You are able to fly all the year round along that route, and long journeys will be or ought to be made with great certainty and safety there. In the second place, Cairo, Karachi, and Baghdad are all places where we have our garrisons of air force in any case for military purposes, because we expect to hold this Middle East theatre very largely through the instrumentality of the air. They will be a substitute for large bodies of troops, and will supplement the troops which are holding these regions. Therefore, there will be three great air stations at these three centres. There will be, probably, eight or nine squadrons distributed among them. They have to be there in any case as part of our general strategic arrangement. It will be very convenient to let mail flying, passenger flying, and civil flying take place over this route, because we shall have to keep the stations there anyhow. It will mean that you will not have to saddle the mail contract with the burden of all the aerodromes and hangars and the regular plant, because those will be there for military purposes. Of all the places where you can bring civil aviation into effective commercial use this section between Cairo and India is the best It has also the effect of buckling the Empire together in a very remarkable manner, because by the saving of time it ought to be possible to fly in two days, or in three days at the outside, from Cairo to Karachi, and that saves a large part of the eleven or twelve days which would be spent at sea.

With regard to Halton Boys' Training College, I can report that the buildings and estate now belong to the State. They were taken over in the war, but were so much knocked about, both the house and the estate generally, that it was a better investment for the Crown to purchase than to pay money to the owner. We made a good bargain in the interest of the State, and it is now one of the most valuable properties in the possession of the Air Force. We not only propose to put our staff into the house, but we propose to put in the grounds the principal training college for young air mechanics. It is all part of the full scheme which was embodied in the Trenchard Memorandum. Nearly all the mechanics in the Royal Air Force want to go; at any rate, the overwhelming majority want to go, and we should not be able to put any aeroplanes into the air unless we set to work at once with the training of new and trustworthy mechanics. That, of course, takes time. For many months we have had between 3,000 and 4,000 boys in training. It is an imposing sight to see those enormous long walls with their hundreds of lathes, at which the boys are being taught professions which will be of the very greatest utility to them, apart from the Air Force, in their after-life. When you have these boys being trained there it is essential that the conditions should be suitable and provide for their health. At present the buildings are falling to pieces. We are going to replace the huts by a regular system of brick buildings, making the place a great and permanent centre of Air Force training. The sanitary arrangements also are being considered. There will be a gymnasium and a recreation room, and, I think, a cinema. At any rate, there will be all the regular institutions of a small, modern, educational community. With regard to the Appropriations-in-Aid, the principal payment has been made by the United States. Hon. Members will perhaps remember that in the last year of the war we undertook to assemble for the United States an enormous number of aeroplanes that they were not able to assemble themselves. The aeroplanes were brought over to this country in parts, and we fitted them together. Aerodromes were fitted up at considerable expense for this particular work. They have been able to repay us the charge agreed upon, and we have not had to wait, as we have had to do in regard to repayments by all other countries.

The Resolution was agreed to by the House.

On the remaining Resolutions which were finally agreed to Mr. KELLY alone spoke. Nobody intervened and nobody replied.

And so the Air Estimates debate concluded.

THE KING'S SPEECH.

In the course of the King's Speech proroguing the Houses of Parliament on Dec. 23rd, the following passage occurred :

"Great progress has been made during the past year in the gigantic task of demobilising My Navy, Army, and Air Force, impeded as it has been by the uncertainties of the situation in large parts of Europe and Asia."

THE FRENCH CIVIL AVIATION BUDGET FOR 1920.

Civil Aviation in France is governed by the Office de Coordination Générale de l'Aéronautique over which General Duval presides. Grouped under this office are the three different aeronautical sections, the S.N.Aé. (Service de la Navigation Aérienne), the S.T.Aé. (Section Technique de l'Aéronautique), and the S.F.A. (Service des Fabrications Aériennes).

This office has prepared its Budget for 1920, and proposes to ask the Chambers for supplies to the amount of 233,393,000 francs (normally, £9,335,720). This money, if granted, will be allocated as follows :—

	Pay. fr.	Operation of Services. fr.	Construction of Materiel. fr.	Transport of Materiel. fr.	Special Wartime Indemnity. fr.
S.N.Aé.	5,743,920	23,549,603	Aeronautical, 63,350,000 Aviation, 62,470,000 Research, 3,766,000	1,000,800	75,000
S.T.Aé.	890,000	46,155,000	Construction, 4,830,000 Competitions, 16,000,000		
S.F.A.	1,706,700	2,000,000	350,000		

To which should be added a sum of 25,000 fr. allocated in general to the three sections for "charges de famille," whatever that may mean.

The 63,000,000 fr. allotted to the S.N.Aé. for aeronautical construction is to be devoted to the construction of four dirigibles, and to their operation in civil work. 20,000,000 fr. of the vote for S.N.Aé. will go to aerial navigation companies in the form of premiums and subsidies.

THE FUNERAL OF SIR JOHN ALCOCK.

The funeral of Sir John Alcock, K.B.E., D.S.C., took place on Dec. 27th at Manchester, Major-Gen. Swinton, C.B., D.S.O., representing the Royal Air Force, and Squadron Leader E. R. Moon, D.S.O., representing the Secretary of State for War, were present.

H.M. the King and Capt. H.R.H. the Prince Albert, K.C., R.A.F., have sent messages of sympathy to Mr. and Mrs. Alcock. The King's message, forwarded by Lieut.-Colonel Clive Wigram, is as follows :—

"The King desires me to express his deep sympathy with you in the untimely and tragic death of your distinguished son, whose name will ever occupy an honoured place in the roll of British airmen who never spared themselves in order to uphold the honour of their country. It was with pleasure His Majesty recently decorated your son for his great feat in crossing the Atlantic, and the King feels that the early close in the prime of manhood of so valuable a life is an irreparable loss."

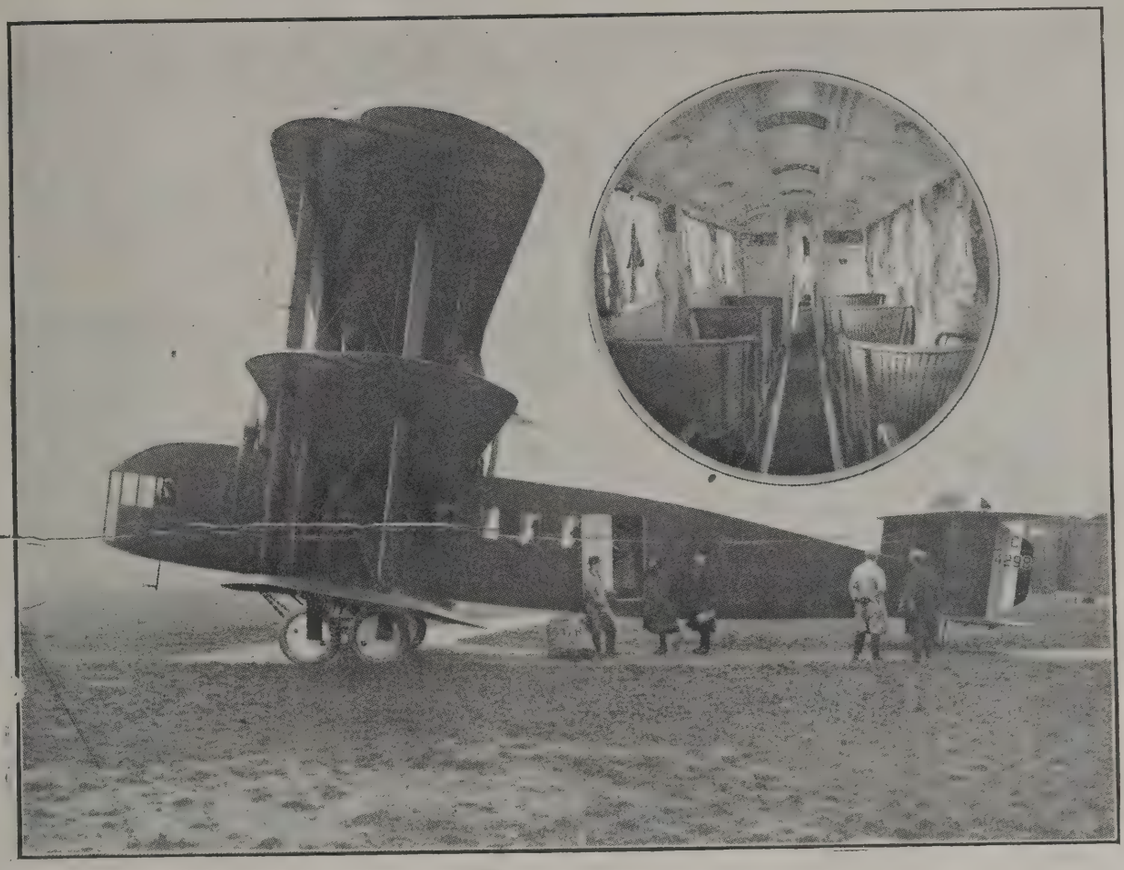
The message from Prince Albert, forwarded by Wing Cmdr. Louis Creig, R.A.F., reads :—"I am desired by His Royal Highness Prince Albert to express to you his deep and sincere sympathy for the loss of your gallant son. Your son's services to his country, both in war and peace, will ever be remembered."

THE NEW SECRETARY OF THE R.Ae.S.

Owing to the resignation of Mr. W. Barnard Faraday, LL.B., who has filled the office of Secretary to the Royal Aeronautical Society with such marked success during the past four years, it has been necessary to find a new secretary. The choice of the Council has fallen on Lieut.-Col. W. Lockwood Marsh, late R.A.F.

Colonel Marsh has during the war been concerned with airships, and has made a name for himself as an authority on these craft. It seems well, thus, that the Secretary of the R.Ae.S. should have a personal interest in airship work, as this will prevent him from devoting himself to the heavier-than-air side of aeronautics to the prejudice of lighter-than-air.

Mr. Faraday's departure will be deeply regretted, for his affability and good humour have endeared him to all who have had dealings with the R.Ae.S. The recently-published Glossary of Aeronautical Terms issued by the R.Ae.S. as the result of the work of the Technical Terms Committee will remain as a monument to Mr. Faraday's industry and assiduity during his term of office. All will wish him well in his new work, and all likewise will wish Colonel Marsh success as Secretary of the oldest society in the world concerned with aeronautics.—C. G. G.



THE ROYAL AERONAUTICAL SOCIETY.

A juvenile lecture to the children of members and friends of the Royal Aeronautical Society, entitled "How Airmen Find Their Way," will be delivered on Thursday, Jan. 8th, 1920, at 3 p.m., at the Royal Society of Arts, by Major H. L. Wimperis, R.A.F. Tickets may be obtained from the Secretary, R.Ae.S., 7, Albemarle Street.

THE AEROPLANE'S PARIS AERO-SHOW REPORTS.

The Reports on the Exhibits at the Paris Aero Show will be published next week and the following week in the "Aeronautical Engineering" Supplement to this paper. The machines will be described and criticised by Captain W. H. Sayers (late Technical Dept., R.A.F.) and Mr. C. G. Grey. Every machine shown will be illustrated by sketches drawn on the spot by Mr. Leonard Bridgman (late Technical Officer, R.A.F.). These reports will be found to be the most complete and illuminative published in any paper. The number of copies available is limited, and those who wish to obtain copies should order them at once from "The Aeroplane" Publishing Department, 61, Carey St., London, W.C.2.

The "Bristol" Aeroplanes

TWICE AS FAST AS THE FASTEST EXPRESS.

The "BRISTOL" Pulman Triplane, carrying pilot, engineer and 14 passengers, embodies with great speed the highest possible degree of comfort. Seated in a spacious and wholly enclosed Pullman car, in which electric lighting and heating have been installed, the passengers are carried at a maximum speed of 125 m.p.h. The four 410 h.p. engines which provide the motive power ensure absolute reliability and safety.

Full details of this machine, the most luxurious and efficient of its kind, will be supplied on application.

THE DEATH OF CAPTAIN SIR JOHN ALCOCK, K.B.E., D.S.C.

The death of Sir John Alcock is a severe blow to British Aviation, in that he was naturally much in the public eye, but still more is it a blow to his old friends among those concerned with flying, for his sterling worth, his modesty, and his good heart endeared him to all who knew him. It is the irony of fate that one who had gone through all the perils of the early days of flying, who had made long raids over the worst of enemy country, and who had crossed the Atlantic on a land-going aeroplane, should die in a simple accident.

As to the nature of the accident there can be but little doubt. One who investigated the cause closely the day after the occurrence gives the following particulars :—

As may be seen from the sketch, the machine—which was a Vickers "Viking" amphibian flying-boat, with retractable landing-wheels and a Rolls-Royce engine—struck the ground 80 yards away from a wire fence over which it had passed. The occupants of the farm, shown in the sketch, heard an aeroplane approaching through the mist, which was scarcely a fog. The machine circled round the field, judging by the sound, though it was only seen for a moment.

At the end of the circuit it came round over the farm quite low down and carried away the top branch of a tree. This branch was quite small and would not appear to have been strong enough to affect the progress of such a machine as that on which Sir John was flying. The machine disappeared in the mist, and a few seconds afterwards a crash was heard.

The farm people went over the fence into the field and found the machine standing on its nose. The pilot was still in his seat, with his hands gripping the spade-handles on each side of the control column. Every control was intact and operated freely after the smash.

The surgical examination showed that no bones were broken except his jaw. He had pitched forward into his wind-screen, and the blow on the point of the jaw had jerked his head back and had fractured the base of the skull. Men have been killed in boxing matches by blows on the point of the jaw producing precisely such an effect.

From this it is evident that the force of impact was small, so it is clear that the actual fall can only have been a matter of a few feet. The landing-wheels were down in position to land, but there was no mud or grass on them to show that they had ever touched the ground. Also, the only parts of the machine which hit the ground were the nose of the boat, which was crumpled back, the leading edges of both lower planes, and the noses of both wing-tip floats.

Hence, the only possible assumption is that the machine struck nose-on from a height of a few feet. The only possible deduction, therefore, is that she stalled when very low down.

It would be difficult to imagine so skilled and experienced a pilot as Jack Alcock stalling his machine when landing if one did not perceive the probable cause of his doing so. It will be noticed that it is 90 yards from the line of trees to the wire fence. As the machine actually hit the top of one tree the assumption is that he was gliding down to land and deliberately scraped low over the trees to do so.

In such a case he would be only 30 feet or thereabouts above the ground when crossing the line of trees. As he would be gliding as slowly as possible his angle of descent against the wind would probably be about 1 in 6 or 1 in 7. Thus, in 60 or 70 yards he would be within a few feet of the ground.

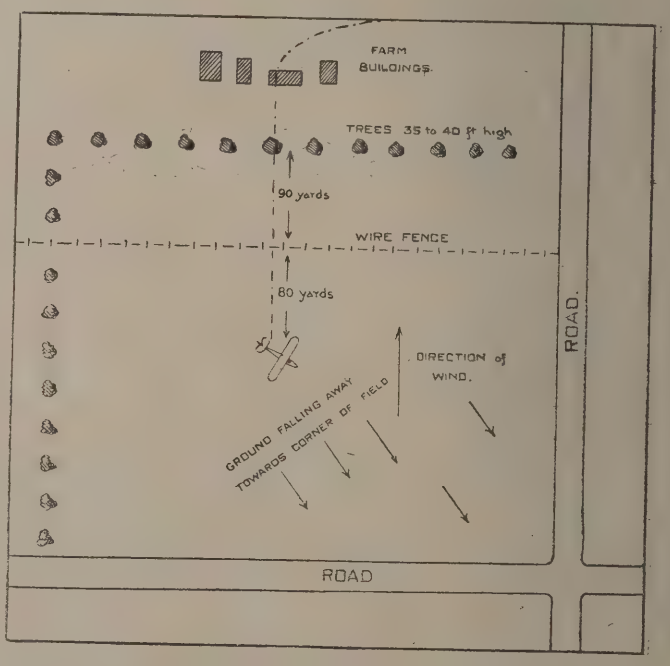
It may be assumed that he then saw the wire fence 15 or 20 yards in front of him, and made an effort to lift the machine over it. Whether he opened out his engine to get the necessary lift or not does not seem to matter much. Though the farm people say that they heard the engine running till they heard the crash one cannot rely on this evidence, for their unaccustomed ears may have deceived them.

In either case it seems clear that in trying to lift the machine over the fence it shot up a few feet into the air, carried on for another 40 or 50 yards and then stalled and dived onto its nose.

There is just a possibility that on seeing the fence he opened his engine intending to fly another circuit and land the other side of the fence. In this case he may have stalled with his engine full on, in which case one thinks the crash would have been worse than it was in fact. Or the engine may have choked or faltered at the critical moment and have left him in a stalled position. Or he may have flown over the fence intending to land beyond it, where, owing to the rather sudden fall of the ground towards the corner of the field, and the position of his wind-screen, together or separately, causing him momentarily to lose his horizon, he may have flown straight into the ground at the point indicated. In this case, it is hardly likely that the machine would have struck direct on its nose.

It would seem, therefore, in any case, that the direct cause of the accident was a praiseworthy but wholly lamentable attempt on the part of the pilot to save his machine from injury. If he had landed and run into the fence, or if he had landed on top of it, the big strong boat-hull would simply have swept the fence away, and even if there had been a ditch alongside the fence the keel of the boat would have slid across it. But, no doubt, he was anxious to save the machine from even scratches and tears, in view of the fact that it was to have been exhibited at the Paris Show after alighting on the Seine near the Grand Palais.

His reason for landing was that the mist was so thick at that point that one could only see 50 or 100 yards ahead, and might well have been thicker farther inland. As a matter of fact there was hardly any mist east of Rouen, and near Paris the weather was clear and sunny, with occasional showers. All of which shows how large a part pure luck plays in the fate of man.



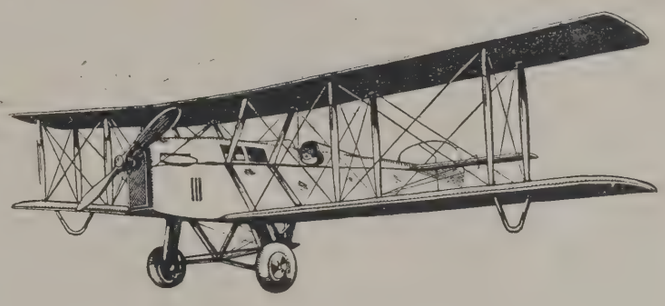
Whether the foregoing be the true explanation of the accident or not the points suggested therein are worthy of consideration by all pilots. The great lesson to be learned from this, as from the deaths of so many other experienced pilots, is that when anything unforeseen occurs a pilot should never attempt to save his machine if he sees that he can alight safely at the expense of a little damage to the aeroplane.

Those of us who knew Jack Alcock, the quiet, unassuming but earnest and confident aviator-mechanic at Brooklands, who later met him as a Warrant Officer pilot, R.N.A.S., who saw him again as a commissioned officer with a D.S.C., and, again, as the hero of the great trans-Atlantic flight, have known him always as one of the salt of the earth. Those under whom he worked and those who worked under him alike esteemed his solid worth and his sound common sense.

He loved flying for flying's sake. He was ambitious to do something big for the sake of flying rather than for any monetary reward it would bring. One remembers a certain letter which he wrote from his prison camp in Turkey telling one that he was well and fit, and adding that after the war he would be ready for "any big stunt." He had his wish. He achieved the biggest "stunt" of all, the direct flight across the Atlantic.

Now he has had the "very great adventure." At the end of it he has found many old friends in that Valhalla where dead aviators meet. But he has met no enemies, nor has he left any enemies behind him, for Jack Alcock had none.

C. G. G.



ALLIANCE TYPE P1.

The Owner-Driver's Machine.

Extremely simple in details. Robust construction. Fuel cost 3¼d. per mile. Speed variation 30 to 77 M.P.H. range with pilot and two passengers, or 300 lbs. of mails, 300 miles. Dual control can be fitted if required.

ALLIANCE TYPE P4.

This machine has been specially designed for passenger-carrying over medium distances.

With four passengers and a pilot in a comfortable saloon, it has a range of 800 miles at a fuel cost of 4¾d. per mile.

It has a top speed of 107 M.P.H. and a landing speed of 40 M.P.H., which, combined with a wide tracked oleo undercarriage, renders it capable of being landed almost anywhere. The wings fold for storage purposes, bringing the span down to 15 ft.

For terms and particulars of this and other types, and appointments for demonstrations, apply to:—

GREAT BRITAIN.

NAVAL.

Movements of Ships.

It is reported that H.M.S. "Ark Royal" left Port Said for Suez and Aden on Dec. 22nd.

MILITARY.

THE CASUALTY LIST.

Reported Dec 29th.

PREVIOUSLY REPORTED MISSING, NOW REPORTED KILLED.—Harel, Lt. L. O., R.F.C.
Pinder, Lt. S. R., R.F.C.

The Afghan War.

On Dec. 17th the Titi Madda and Hassan tribes were again bombed, and have now asked for an extension of time for their decision regarding the peace terms.

On Dec. 18th the Derajat column operating against the Mahsuds advanced from Jandola to Mandannakach. Aeroplanes successfully co-operated.

It was officially announced on Dec. 30th that the Mahsuds have surrendered. Among some telegrams, dealing with the situation, sent from India on Dec. 27th, the following was included :—

Our aeroplanes attacked Katkai on Dec. 25th, which had been a place of hostile concentration for the previous four days.

A Golf Club and R.F.C. Officers.

A correspondent writes :—

On Thursday, Dec. 18th, the Court of Appeal, Lord Justice Atkin (Master of the Rolls) and Lord Justice Younger, heard the appeal of the Wey Manor Golf Club against a decision of Mr. Justice Darling refusing to award compensation to the club on a petition of right against the Crown, founded upon an alleged breach of a contract to board a minimum of 20 R.F.C. officers with the club in 1916 and 1917.

During the war a number of R.F.C. officers stationed at Brooklands Aerodrome were accommodated at the club-house, and the question raised in this appeal was whether a statement in a letter to the Military Authorities from the club secretary dated May 26th, 1916, amounted to a contractual obligation by the War Office, or merely to the expression of an expectation, the fulfilment of which was not intended to be grounded upon obligation. A sum of £500 was spent on furnishing the club-house for the officers.

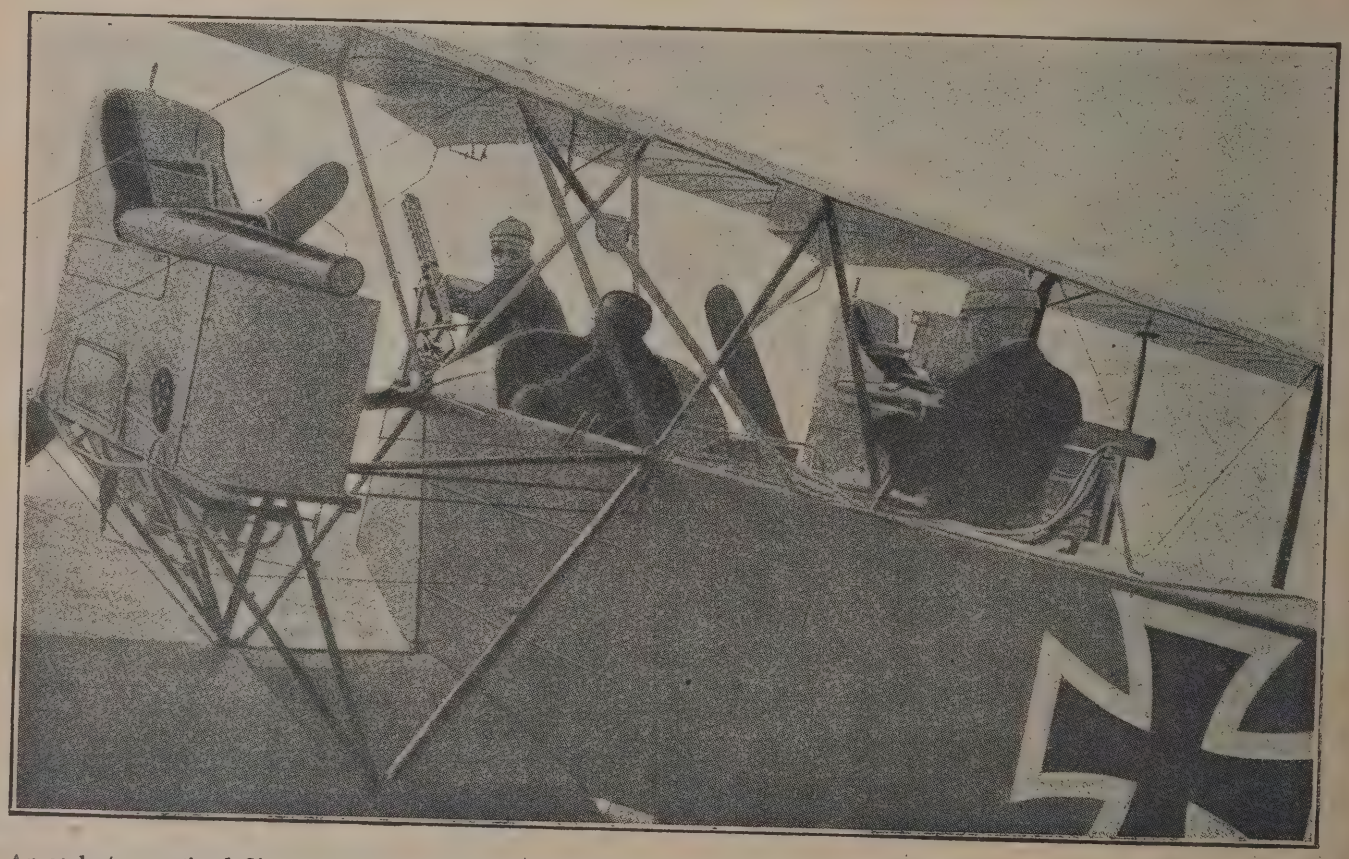
After Oct. 4th, 1917, no officers had been sent to the club, although Brooklands continued to exist as a military station.

The Court, by a majority, dismissed the appeal.—J. F. S.

AIR FORCE.

A Rescue.

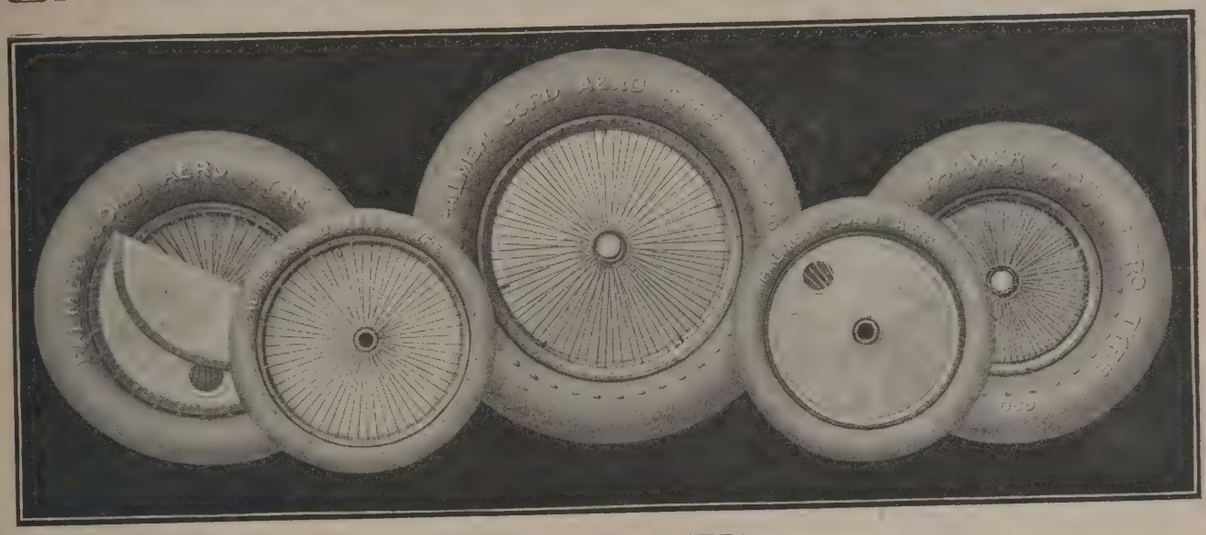
Lieut. Wood, R.A.F., a South African, was seriously injured on Dec. 27th while rescuing a woman from drowning in the Thames. He dived from Hammersmith Bridge, a height of about 30 ft., and apparently his head struck the bottom. He was successful in saving the woman.



CANADA.

A Death.

Major A. E. McKeever, D.S.O., M.C., a Canadian aviator, died recently at Toronto after an operation necessitated by a motor-car accident.



CHINA.

Mr. Tom Gunn, the General Director of Government Aeronautics, Department of Kwongtung, China, recently arrived at San Francisco for a two months' stay in the United States. The purpose of his visit is to complete negotiations for the delivery of aircraft to be used in the preliminary training of Chinese aviators. The Government of China ordered four seaplanes and eight land machines from the Curtiss Aeroplane and Motor Corporation a year ago, and Mr. Gunn will supervise the delivery of these machines.

An early two-engined Siemens-Schuckert Biplane used by the Germans on the Western Front. In the particular example shown the after cock-pit is occupied by a man with a Kinematograph camera who was engaged in taking pictures for the scientific investigation of the machine's behaviour in the air.

THE PALMER TYRE LIMITED

Contractors to the Admiralty, the War Office, and the Ministry of Munitions,

119, 121, 123, SHAFTESBURY AVENUE, LONDON, W.C.2.

Telegrams: "TYRICORD, WESTCENT, LONDON." Telephone: GERRARD 1214 (Five lines).

PARIS: 24, Boulevard de Villiers, Levallois-Perret.

AMSTERDAM: Stadhouderskade 91.

While in San Francisco Mr. Gunn stated in an interview that little progress had been made in military aeronautics in China, but the recent civil war had proved the need for adequate aerial defence. Naval aviation, he said, was favoured by the great expanse of protected water along the sea-coast.

FRANCE.

Meteorological Stations in France.

In 1920 it is hoped that the meteorological organisation in the aerial arm of the French Army will be greatly developed. Thirty-five stations, divided into three groups, will be installed. The categories of the groups are as follows :—

(i) A central station at Le Bourget (already in existence) which receives long-distance meteorological messages from England, Spain, the Azores, etc. This station will co-ordinate the reports from the regional stations.

(ii) Six regional stations, which will collect information from local stations and submit the general results to Le Bourget. From March, 1920, they will, it is hoped, issue daily a précis of meteorological observations at 1 a.m., 7 a.m., 9 a.m., 1 p.m., and 6 p.m. When possible three aerial soundings will be made daily at 8 a.m., 11 a.m., and 5 p.m.

(iii) Principal and secondary stations reporting to the regional stations.

All these stations will be laid out along the following routes, Paris-London, Paris-Brussels, Toulouse-Rabal, Nimes-Nice, and Marseilles-Tunis.

An Atlantic Flight.

Lieut. Lefranc arrived at Las Palmas (Canary Isles) on Dec. 24th, at 3 o'clock, from Agadir, on his St. Raphael-Dakar flight.

The Trans-African Flight.

Major Vuillemin and Lieut. Dagneaux, who are at present in Algeria organising their cross-African flight, will use two Bréguet biplanes—16.B. and N.2 types—for the flight. Wireless stations will be installed along the route and petrol dumps arranged at various places. Large spare parts will be available at Tamanrasset and Timbuctoo.

Two routes, starting from Oran and Algiers respectively, are considered by experts. They follow the same track from 250 miles short of Timbuctoo to the end of the journey at Dakar. The other route, which is not so popular, lies over Ain Sefra, Timmimimun, Akabli, Inziza Bu Gassa, Kidal, and Burrem to Timbuctoo.

The route which probably will be adopted runs from Algiers to Biskra, Inifel, Insalah, Tesnu, Tamanrasset, Tin Zuaten, and Kidal. The route from Timbuctoo to Dakar will be by Bammako. If the last route be chosen the first stage will be 600 miles, and the succeeding stages be 390, 240, and 480 miles. The last stage, Bammako to Dakar, will be 600 miles.

GERMANY.

The following is taken from the U.S. official publication, the Air Service News Letter of Dec. 3rd, 1919.

Casualties in the German Air Service.

According to reports received from Germany the following are losses of German Air Service during the war :—

	Officers.	Enlisted Men.
Battle	2,857 ...	3,047
Training	584 ...	1,378
Total	3,441 ...	4,425

The number of enlisted men named as casualties is due to the fact that German pilots were not all commissioned.

HOLLAND.

The British Government has officially announced that it was by British aircraft that bombs were dropped on Dutch towns in Zeeland between Aug. 25th, 1917, and June 22nd, 1918. The British Government has expressed to the Dutch Government its regret for these mistakes, and has offered indemnification.

This announcement has given satisfaction to those in Holland who were somewhat annoyed and astonished when the British Government at first saw fit to deny all knowledge of these occurrences.

ITALY.

The Italian correspondent of THE AEROPLANE writes :—

Teaching Brazil's Navy.

Flying is now permitted to the instructors at Malpensa in order to get on with the instruction of the Brazilian Naval pilots who are there learning to pilot the Sva and Ballila types of Ansaldo machines, and have lost a long fine spell of autumn weather owing to European misagreements.

In the Red Sea.

An aeronautical section has left for the Colony of Eritrea, in the Red Sea, with several Voisin aeroplanes.

A Move.

A daily paper announces that the Lower Adriatic and Ionian Air Command is transferred from Brindisi to Taranto.

The Rome—Tokio Flight.

The latest model F.I.A.T. B.R. is reported to be at Rome for the Tokio regularity flight. Thus the representatives of Italy's landing aeroplanes are completed. Lt. Ranza is stated to be the pilot, and the machine's capacity is called 1,500 kilometres.

The Caproni triplane which joined the waiting crowd at Rome is a Fiat-engined, tri-motored craft with tank fuel and water capacity of 11 hours. She, like the others, is armed, and has suitable accommodation for all her spares, such as wheels, airscrews, tail planes, etc. This machine is called, I learn, a 600, and carries two pilots and two motormen. She will rely on a Crocco route-indicator of naval fame.—T. S. H.

RUSSIA.

Aerial Activity.

A wireless message from General Denikin's forces states :—Our aviators are making constant raids on the enemy's rear, despite unfavourable atmospheric conditions, causing panic in his ranks. British aviators are taking part in these operations.

Another Bolshevik Capture.

In an official communiqué dated Dec. 21st concerning the capture of Novo Nikolaievsk, the Bolsheviks state that sundry aviation works are included in the assests of the town.

SPAIN.

Some New Military Aerodromes.

Five new military aviation schools are being opened at Madrid, Carthagena, Tarragona, and Seville.

UNITED STATES OF AMERICA.

The American Air Force,

A new Bill has been introduced in Congress by Senator Harry S. New for the establishment of a Department of Aeronautics and for the Development of Civil Aviation.

The Bill is similar to that introduced by Senator New last October, except that it provides for a Department of Aeronautics in place of a Department of Air, increases the salary of the director from 10,000 dollars to 12,000 dollars, and would, in addition to creating a separate air force also have an air force for the Army and an air force for the Navy, each to be operated by the Army and Navy respectively.

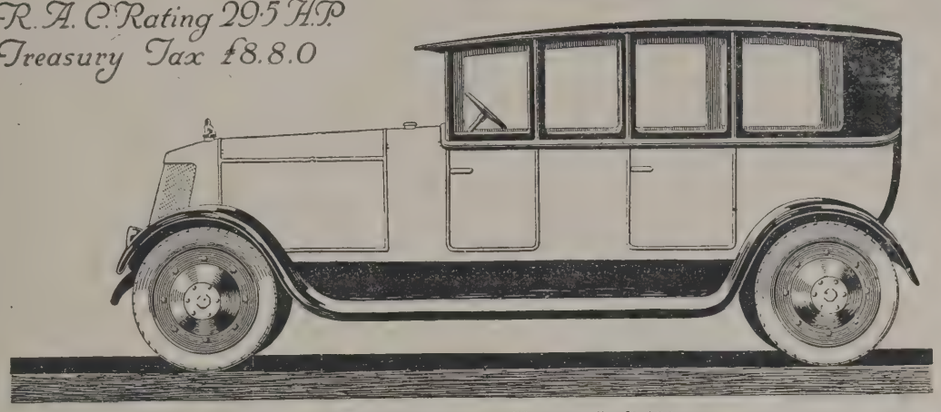
The Bill also provides for the establishment of a college for the training of pilots. The Senator hopes that this Bill will meet with the support from the Military and Naval Authorities denied to his former Bill.

In connection with the above it is interesting to note that Senator Wadsworth, the Chairman of the Military Affairs Committee, in demanding a separate department of aeronautics protested on Oct. 28th, against the elimination of the appropriation for 15,000,000 dollars for military aeronautics as made by the conference committee.

Senator Wadsworth claimed that at present the United States could not put three squadrons of aeroplanes in the field against an enemy, and Senator Thomas said that unless something was done shortly they would have an air service which was inferior to that of Mexico.

A Squadron Move.

The 8th Balloon Coy. (1st Lt. Byront Burt, U.S.A. A.S.) has left Brooks Field for Camp Birnie, El Paso, Texas, to organise the first Army airship station on the Mexican border. As soon as the shed is completed it is hoped to carry out various experiments with one of the new twin engined Army airships.



Cavalry and Aircraft.

In a request for better liaison between cavalry and aircraft on the Mexican border, the Air Service News Letter of Dec. 3rd cites the following instance in support of its argument :—

Some Mexicans having procured illegally some horses and mules from the neighbourhood of Fort Hancock, Texas, a strong force of cavalry and one aeroplane were sent in pursuit. The aviator having located the enemy failed to make the cavalry understand his signals, and by the time he had landed—in U.S. territory—borrowed a horse and found the cavalry, the Mexicans had turned the animals loose.

The ARMSTRONG SIDDELEY Six Cylinder Car

R.A.C. Rating 29·5 H.P.
Treasury Tax £8.8.0

Saloon Double Phaeton as illustrated) £1,000.

IT is the desire for the best which influences the discerning motorist in the selection of his car. ¶ To satisfy this desire you cannot make a wiser choice than the Armstrong-Siddeley 6-Cylinder. ¶ It embodies the best of everything—design, material, craftsmanship—that goes to the making of a high-class motor carriage. ¶ The Armstrong-Siddeley 6-Cylinder is a motor carriage of high efficiency, stately appearance, and ample power. ¶ It is light. It is comfortable. It is dependable. It runs smoothly, silently, and is easily managed. ¶ Three years' free inspection. ¶ You cannot buy a better car.

PRICE *of* CHASSIS EQUIPPED WITH Disc Wheels and one Spare Rim; four 820 × 135 Rubber Studded Tyres; Specially Designed Wings, Scuttle Dash with instrument board; Lucas Engine Starter and Electric Lighting, complete with 5 lamps, Mechanical Tyre Pump, Kit of Tools, etc. £720

ARMSTRONG SIDDELEY MOTORS LIMITED, COVENTRY.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

GREAT BRITAIN.

Civil Aerodromes.

The Air Ministry announced on Dec. 22nd that the following lists of aerodromes are issued as an addition to or amendment of the lists already published.

List C.—(Stations temporarily retained for Service purposes.)

Amendment.—The following seaplane station has been transferred to List E, and is now published in that list.

Seaplane Station: Westgate (S.) Nearest railway station: Westgate. Nearest town: Westgate-on-Sea.

List D.—List of aerodromes licensed as suitable for Avro 504K. and other similar types only. Except in very few instances accommodation does not exist. The licenses have also in the majority of cases been issued for limited periods only.

Aerodrome: Troon. Location of aerodrome: Ayrshire Polo Club Ground. Nearest large town: Troon.

List E.—Stations no longer in use by the R.A.F.

These stations have been passed to the Government Property Disposal Board. They will be relinquished as soon as the Government property thereon has been disposed of. In many cases the aerodromes are now under cultivation, but it is probable that the sites still form the best emergency landing grounds in the immediate neighbourhood.

Seaplane Station: Westgate (S.) Nearest railway station: Westgate. Nearest town: Westgate-on-Sea.

THE CONTINENTAL AIR SERVICES.

	DH9a.	Lt. Game			12.30 p.m.	3.05 p.m.	0

Dec. 25th—27th—Flying suspended for Christmas holidays.

Each machine carried mail as well as passengers.

On Jan. 1st, 1920, weather permitting, the Airco machines will fly to and from Paris as usual.

On Dec. 22nd two machines arrived at Hounslow from Paris and another from Brussels. Another machine left Hounslow for Brussels, carrying passengers and 154 lb. of freight.

London-Riviera Flights.

Lieut.-Col. G. L. P. Henderson (ex-R.A.F.) and another pilot are going to fly to the Riviera early in January. It is understood that there will be accommodation for four passengers in each machine. Two stops will be made on the journey at Paris and Lyons and hotel accommodation will be reserved at those places by the Lep Aerial Travel Bureau, of Piccadilly Circus, from whom tickets may be obtained.

It is expected that the flights will be completed in two days. The single fare to Monte Carlo, Mentone, or Nice is £50.

On Dec. 22nd 2,000 lb. of patê de foie gras were brought over from Paris in three hours in a Handley Page biplane for Fortnum and Mason, of Piccadilly. A quantity of the paste was sold before Christmas in boxes, with which were given a photograph of a Handley Page machine.

Brooklands.

A correspondent writes:—

The youngest daughter of Mr. W. G. Chapman, of Leatherhead, who has a D.H.6 biplane (90-h.p. Curtiss engine) housed at Brooklands, recently flew in this machine, the pilot being Lieut. Knowles, R.A.F. The young lady, who is only one year and five months old, has probably created a new "record" by her *baptême de l'air*.

The first Martinsyde F.6 was recently tested at Brooklands by Mr. Raynham, and performed exceedingly well. It will be flown to the Paris Aero Exhibition this week. It is almost a two-seater version of the F.4, differing in minor characteristics, which were described in a previous issue of this journal.—J. F. S.

Edinburgh.

A correspondent writes:—

Edinburgh is having her first taste of civilian aviation. Two companies, Berkshire Aviation, Ltd., and the Aerial Photos, Ltd., are at present running a series of passenger flights at one guinea each person.

People in Scotland, and especially in Edinburgh, were inclined to look askance at aviation as a method of travelling, but since the inauguration of the flying meetings on Dec. 22nd hundreds of converts have been made. In the first five days the two companies have given trips to nearly 1,000 persons.

Mr. Alan Cobham is responsible for the piloting of an Avro biplane for the Berkshire Co. at Crewe Toll, Ferry Road, and working with the one machine and flying from ten till dusk he has carried over 500 passengers. In addition to the ordinary flights, Mr. Cobham has been responsible for entertainments in the way of parachute descents and also exhibitions of walking on the wings of the machine whilst in flight. He arranged for the principals from the pantomimes, "Robinson Crusoe" and the "Babes in the Wood," which are appearing in the city, to come to the flying-ground in their pantomime dress, when they were given flights.

Night flying, to give the citizens a chance of seeing the city by night, is to start in two or three days' time, and already bookings have been made.

The Edinburgh "Evening News" and the "Bulletin" have been responsible for the issuing of free flights through the medium of coupons in their papers, and they have been very popular. On Christmas Day, Aerial Photos, Ltd., delivered by aeroplane at their ground at Craigentinny, Portobello, a Santa Claus, who was dressed in the historical garb and who distributed toys and gifts to the children on the ground.

Flying is to continue for another fortnight.—MAC.

THE LATEST MARTINSYDE.—The F.6 two-seater biplane, fitted with a 300-h.p. Hispano-Suiza engine, which has successfully made test flights, and is to be flown to Paris for exhibition purposes this week.

Leatherhead.

Mr. W. G. Chapman, of Leatherhead, whose D.H.6 biplane is one of the few privately owned aircraft in Great Britain, has made a good number of flights lately. On Nov. 30th, with his pilot, he set out from Brooklands for Bournemouth, but at Basingstoke very bad clouds at 1,000 ft. were encountered, so they returned to Leatherhead for lunch.

In the afternoon of Dec. 12th Mr. Chapman flew to Bookham and paid a visit to Gillet Stephens and Co., Ltd. He then continued to Leatherhead, where his eldest and youngest daughters were taken up. The latter was aged 1 year and 5 months.

On Dec. 24th the machine was flown to Leatherhead and trimmed with holly, etc., for a Father Christmas "stunt." Toys for three children were carried by the pilot, complete with red cloak, beard, etc., to Sandown Race Course, where he arrived at 8.30 a.m. The wind was very strong and the machine had to take off down wind between the railings. This was especially difficult as the machine was loaded with a large sack full of parcels for Leatherhead.

A successful landing in the St. John's College grounds was followed immediately by a very heavy rainstorm, but, despite the weather, twenty-four parcels were presented to children. Three more parcels were next delivered at Cherington, and then the machine was flown back to Brooklands.

London.

HOUNSLOW.—The Air Ministry announces that the following Notice to Airmen (No. 3) was issued on Dec. 29th :—

A second experimental aerial lighthouse has been erected at Hounslow Aerodrome to further assist aerial night flying.

This lighthouse is of 70,000 candle-power, and throws a revolving beam that attains its maximum brilliancy once every five seconds.

The light will be in operation every night on and after Monday, Dec. 29th, 1919, and will be exhibited from sunset to sunrise.

AUSTRALIA.

His Majesty's Recognition.

The Air Ministry announced on Dec. 22nd that His Majesty the King has been pleased to confer the dignity of knighthood of the Most Excellent Order of the British Empire, Civil Division, upon Captain Ross Macpherson Smith, M.C., D.F.C., A.F.C., Australian Flying Corps, and also upon Lieut. Keith Macpherson Smith, late Royal Air Force, in recognition of the valuable services rendered to aviation by the recent successful flight from England to Australia.

His Majesty has also conferred a bar to the Air Force Medal on the undermentioned serjeants of the Australian Flying Corps in recognition of their valuable services as mechanics during this flight to Australia : No. 275 Serjt. James Mallett Bennett, A.F.M., and No. 8974 Serjt. Walter Henry Shiers, A.F.M.

The End of the Journey.

Capt. Ross Smith reached Longreach (Queensland) on Dec. 22nd. The place is 1,230 miles from Port Darwin and a little over 1,000 miles from Melbourne. On the journey they were worried by flies and mosquitos which made sleep impossible.

The damage to the airscrew was originally due to a hawk at Calcutta which flew into it and cracked it. The mechanics succeeded in mending the airscrew with only a pocket-knife and broken glass. Pieces of wood were fitted to replace those lost, and the whole was glued and screwed together. The damaged blades were bound with hoop-iron covered with linen fabric.

During the stay at Anthony's Lagoon the temperature averaged 110 deg. There were frequent thunderstorms, when they all hung on to the machine to prevent its being blown over. Since Capt. Ross Smith left Port Darwin he had encountered strong head winds and great heat, which made flying very difficult. Often the machine was thrown about like a cork by the atmospheric disturbances, and the crew were all air-sick.

Capt. Sir Ross Smith, K.B.E., finished his flight at Charleville (Queensland). A part of one of the engines has broken which is irreplacable in Australia, and a Central News message states that the machine is being dismantled. The crew have left the machine and are going south by train.

Charleville is 1,473 miles from Port Darwin and 923 miles from Melbourne.

SOUTH AFRICA.

An Avro at Durban.

The Mayor of Durban christened an Avro biplane "Natalia" on Nov. 10th. He afterwards declined a flight. The machine belongs to South African Aerial Transport, Ltd., and Major Miller of that company stated that it would remain in Durban for another month, and daily flights would be made to accustom the public to aviation.

After the christening ceremony passengers were taken up for two hours.

A Johannesburg-Durban Flight.

On Nov. 15th the Johannesburg "Star" published a special aviation edition, containing many articles about flying generally and descriptions of first flights, etc. Copies of this edition were carried to Durban in a three-seater Avro (110 Le Rhône engine), piloted by Major A. Miller, D.S.O. (ex-R.A.F.), and with a representative of the "Star" as passenger. Stops were made at Newcastle and Maritzburg.

Standerton and Volksrust were also "bombed" quite successfully, but Charlestown was missed by quite a mile on account of the strong wind, and the height at which the machine was flying.

Handley Page, Ltd.

Major H. Meintjes, the South African manager for Handley Page, Ltd., in a letter to the Johannesburg "Star," stated that the first machine, fitted with two 375-h.p. Rolls-Royce engines, had already arrived at Capetown. The fuselage is luxuriously fitted, and contains in all 16 armchairs for passengers. Two of the seats are in the nose of the machine.

Major Meintjes was leaving for Capetown to supervise the erection of the machines. The first flight from Capetown to Johannesburg, with only one stop en route, is hoped for in January.

Muizenberg.

A bishop was one of the passengers taken up at Muizenberg Aerodrome (Capetown) on Nov. 26th. He spent half an hour in the air with Mr. Solomon as pilot in an Avro machine.

CHINA.

The Handley Page machine which was erected in Peking made its first official endurance flight on Dec. 16th with complete success. Carrying 200 lb. of sandbags and fourteen passengers, eleven of whom were Chinese, the aeroplane was in the air for three hours.

As the machine circled down, in token of salute, while passing over the Presidential Palace the stomach of one of the passengers failed him, but the remainder were all delighted with the flight. The selection of the site for this *faillance* suggests a revolutionary movement.

Commercial Developments.

In China, naval aviation is favoured by extensive expanses of protected water along the sea coast, and by long and wide rivers leading into the interior. On the other hand, land aviation is hampered by lack of suitable landing fields, due to the intensive cultivation and terracing of the land, and to the large areas of rice fields.

Six Handley Page biplanes have been received at Shanghai to be placed on an aerial mail route from Pekin across the Gobi Desert to Manchuria and South-Eastern Siberia. Other contemplated routes are from Shanghai to Hongkong, Shanghai to Canton, and Shanghai to Peking.

CZECHO-SLAVAKIA.

The Italian correspondent of THE AEROPLANE writes :—

The Prague Press states that agreements have been signed with a large British aerial transport company whereby that city becomes the centre of the cross-European lines London-Paris-Hamburg-Warsaw and Constantinople. A large factory is to be started there with English material and personnel. Two-thirds of the share money is to be Bohemian, however. —T. S. H.

FRANCE.

The Paris-Melbourne Flight Abandoned.

A Reuter telegram from Rangoon dated Dec. 12th stated that owing to the breaking of a piston rod, M. Poulet had abandoned his proposed flight to Australia. He would remain at Moulmein pending preparations for his return home. His aeroplane was being dismantled and will be sent back to France.

M. Poulet's friends will not, however, allow him to abandon his flight to Australia. On Dec. 26th a new aeroplane, subscribed for by his friends, left the Gare de Lyon (Paris) for Marseilles and Calcutta.

The Speed Record.

In dealing recently with the successful (when homologated by the F.A.I.) attack by M. Sadi Lacointe on the speed record on Dec. 15th, it was stated inadvertently that he was flying a Spad biplane. He had at that date severed his connection with the Spad firm, and his record of 307 kilometres an hour was made on a Nieuport biplane (300-h.p. Hispano-Suiza) at Villacoublay.

A Juvisy Meeting.

The Committee of the Paris Fêtes has arranged an aviation meeting to be held at Juvisy on May 22nd and 23rd, 1920.

The Death of M. Bourgeois.

The chivalry of nations is rarely so well revealed as when death gives the opportunity. The funeral services on M. Bourgeois, who was killed whilst flying a Morane-Saulnier "Parasol" monoplane on the military aerodrome of Amadora, near Lisbon, were carried out at the expense of the Portuguese Government, and were conducted with a seemliness and a respect which did honour to that country. The body was transported to France immediately on the conclusion of the obsequies. The final burial will take place at a village near Maubeuge.

The Compagnie Generale Transaerienne.

The Compagnie Générale Transaérienne, which shares the work of maintaining the London-Paris aerial mail, was originally founded in 1909, and is, therefore, the oldest of all existing aerial navigation companies. In the year of its formation it had dirigibles at Pau, Reims and Nancy, and in the three following years had an airship service at Lucerne and at Brussels.

Hydro-aeroplane services were maintained from 1912 to 1914 at Aix-les-Bains, Monaco, Lucerne, Evian and Mentone, and, as "L'Auto" says, did much to popularise aviation. During the war its aerodromes and *matériel* were of considerable use to the military authorities.

In the past summer the company used airships in a Le Havre-Deauville service and for flights from Saint Cyr round Paris.

It is now engaged on its first regular and officially recognised service, and one hopes that its future will be as brilliant as its past justifies.

The Death of an Old Aeronaut.

At Istres, near Marseilles, on Dec. 21st, M. Mario de Montgaillard, who had died a few days before in his 85th year, was buried. He was one of the last survivors of the 80 aëronauts who piloted from Paris during the siege free balloons laden with mails. On Dec. 7th, 1870, he piloted the "Denis Papin," which, with an ill-fortune symbolic of France in those days, came down in the German lines.

M. Santos-Dumont Amuses Himself.

It is said that M. Santos-Dumont, imbued with the charms of Virgil, has opened a model farm in the State of Minas Geraes, in the one-time Empire of Brazil.

The Presidency of the Aero Club de France.

The Aéro Club de France is meeting shortly to elect a President in the place of the late M. Deutsch de la Meurthe. Among the names of those talked of as possible Presidents are MM. Henri Farman, Bessoneau, Soreau, Loucheur, and Blériot.

The Height Record.

On Dec. 20th Lieut. Roget, with two passengers, reached a height of 19,500 ft. thus breaking the existing height record of pilot with two passengers, provided it is homologated by the F.A.I. On Dec. 24th Lieut. Casale, flying a Spad type S.27 (300 h.p. Hispano-Suiza), with two passengers, exceeded M. Roget's record by 2,420 ft., after a flight of 1 hr. 03 min. at Buc.

The Coupe Deutsch.

It is stated from France that the Royal Aero Club has forwarded the entry of a Martinsyde biplane for the Coupe Deutsch.

M. Levasseur and the Height Record.

According to a statement in the French Press, M. Levasseur intends, after the Salon has closed, to make an attempt on the height record with a Levasseur biplane, fitted with a turbo-compresser and a variable pitch propeller.

ITALY.

The Italian correspondent of THE AEROPLANE writes :—

The Italian Aero Club.

A meeting of the Italian Aero Club, held at the headquarters of the same in Rome—*via* Tor de' Specchi No. 24—on 14th inst., decided to support the International Exhibition to be held in that city in the autumn of 1920, and, if it becomes a possibility, also the show proposed for the spring at Turin. Also, the club fixed to enter Italy for the Belgian meeting in connection with the Olympic Games.

The possibility of the Schneider Cup being flown for at Naples was mentioned.

The Commercial Airships.

M.1, which has been resting after her strenuous joy-ride work during the summer, when 2,000 passengers were introduced to the freedom of the aerial highways, left Rome on the 17th under the command of Maj. Leone and with Ing. Usuelli on board for Venice, where she arrived after seven hours' travelling. Advantage of the clear, cold atmospheric conditions and the moonlight was taken by starting at 4 a.m. The ship is to be stationed at Venice and ply between that place and the ex-Austrian shores opposite.

The "Angelo Berardi" also left Rome one day the same week for Verona *via* Florence, where she discharged cargo and passengers. The journey was held up some hours between Florence and Verona by fog, but the vessel entered her fresh shed late the same night.

Competition.

A new F.I.A.T. power-plant is going, it is hoped, to *épater* the Palais Royal.—T. S. H.

SOUTH AMERICA.

Aeroplanes are to be used in French Guiana for the transport of gold from the mines at St. Laurent du Maroni, which is separated from the coast towns by a 100-miles' belt of almost impenetrable forest. The first trip was made successfully last October. Hitherto the gold has been taken down in canoes and by porters.

UNITED STATES OF AMERICA.

The Aerial Mail.

Assistant Postmaster-General Otto Praeger, the Chief of the Mail Transportation Service, has announced that the aerial mail service from New York to Chicago will be extended to Omaha shortly, thence to Ogden and from there to San Francisco, with a network of aerial lines from San Francisco to coast cities, including Seattle, Portland, Tacoma, Fresno, Los Angeles, and San Diego. The air routes have been mapped out, and the plans for aerial mail depots are practically completed.

A bill was introduced into Congress on Nov. 6th to authorise the Postmaster-General to purchase aeroplanes and operate aerial mail routes between New York and San Francisco, and such additional points between those cities as he might consider necessary.

Several Martin bombers (two 400-h.p. Liberty engines) have lately undergone tests at Cleveland, and are soon to be put into operation on the aerial mail service New York-Chicago. The machines will carry a crew of three and one ton of mails at approximately 90 m.p.h. They will be equipped with either wireless telegraph or telephone.

It is the intention of the postal authorities to have new aeroplanes specially designed for mail use, capable of carrying at least a ton of mail each and making an average speed of 150 m.p.h. When these are constructed it will be possible to deliver New York mail in San Francisco 32 hours after its receipt by the New York office instead of four days later as at present.

The first aerial mail route in the United States was established on May 15th, 1918, between Washington and New York. The service on that route the first year was 92.3 per cent. successful. Over seven and one-half million letters were carried at a cost of 137,900 dols., which included the replacement of 6 per cent.

A second route was established exactly one year later between Cleveland and Chicago. Fourteen thousand letters were carried each way daily. On July 1st, 1919, the aerial mail service was established between New York and Cleveland with connections at Chicago.

The service at present employs 73 pilots, 28 mechanics and 95 helpers. The pilots are paid a base salary of 2,000 dols. a year with an increase of 200 dols. up to 2,800 dols. for each 30 hours of satisfactory flying.

The Boom of Civil Aviation.

In connection with the statements issued by the Special Commission to Organise the First Aerial Derby Round the World, which were published last week, Secretary Wadsworth speaking on civil aviation on Oct. 28th, said :—

"In July of this year just 14 airplanes were made in the whole United States, while in the same month Great Britain produced 2,000. That shows how we are standing still while others are going ahead."

A New Transportation Co.

An air passenger corporation, under the title of California Aerial Transport Co. has been organised recently at Stockton, Cal. The company is said to have several machines already under construction, capable of carrying from six to eight passengers, and expects soon to begin making regular trips between Los Angeles and San Francisco.

A Spare Parts Air Service.

According to "Automotive Industries" of Nov. 6th (published Dec. 5th), the Chandler Motor Car Co., of Cleveland, are employing aeroplanes to deliver parts from Chicago, as the express companies and the mail service proved to be inadequate.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

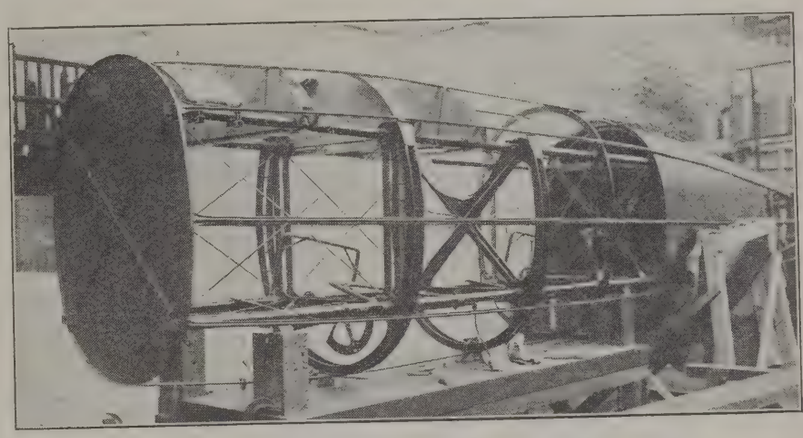
INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE PRODUCTS OF THE BRITISH AIRCRAFT INDUSTRY.—III.

In the two previous issues of this paper there have been described under this heading the aircraft, aero-engines, and accessories manufactured by the British and Colonial Aeroplane Co., Ltd., the Westland Aircraft Works, Wm. Beardmore, Ltd., Austin Motors, Ltd., Martinsyde, Ltd., Parnall & Co., the Aircraft Manufacturing Co., Ltd., Short Bros., Ltd., Rolls-Royce, Ltd., the Cosmos Engineering Co., Ltd., A. V. Roe & Co., Ltd., the British Aerial Transport Co., Ltd., Mann, Egerton & Co., Ltd., Handley Page, Ltd., S. E. Saunders, Ltd., the Supermarine Aviation Works, Ltd., the Central Aircraft Co., Walton Motors, Ltd., Gwynnes, Ltd., Austen Siddeley Motors, Ltd., the Aircraft Steel Construction Co., Ltd., the British Thomson-Houston Co., Ltd., the Steel Wing Co., Ltd., Samuel Osborn & Co., Cellon, Ltd., Edgar Allen & Co., Ltd., Titanine, Ltd., Bruntons, Ltd., British Magnetos, the Triplex Safety Glass Co., Ltd., Swift, Levick & Co., Herbert Terry, Ltd., Hall & Pickles, Ltd., and Brown Bros., Ltd.

A further series of the products of other members of the Industry will be found below.

BOULTON AND PAUL, LTD.



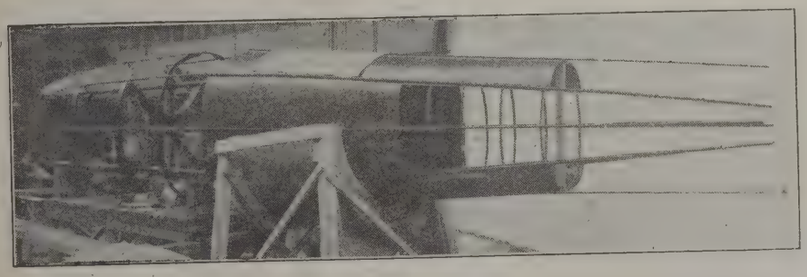
AN ALL-METAL MACHINE.

During the last few years there has been a demand for an all-metal type of aeroplane which can fulfil the following conditions :—

The structure must be fireproof, immune from insect attack in tropical countries, and varying climatic conditions must not produce distortion.

Certain machines have been designed to meet the above-mentioned requirements; generally, however, they have been heavy and expensive to produce, and, with only a few exceptions, the wing structure has not been entirely of metal. If one studies the detail of design of this type of machine, it will be also found that no departure has been made from the type of construction usually associated with aeroplane structures of wood—the only difference being that steel tubes have been substituted for wood members.

For a considerable period Messrs. Boulton and Paul have concentrated on the development of rolled sections made from thin steel strip having high mechanical properties; and as the result of this work, they have produced suitable sections which can be used on aircraft giving the necessary strength for the weight allowed.

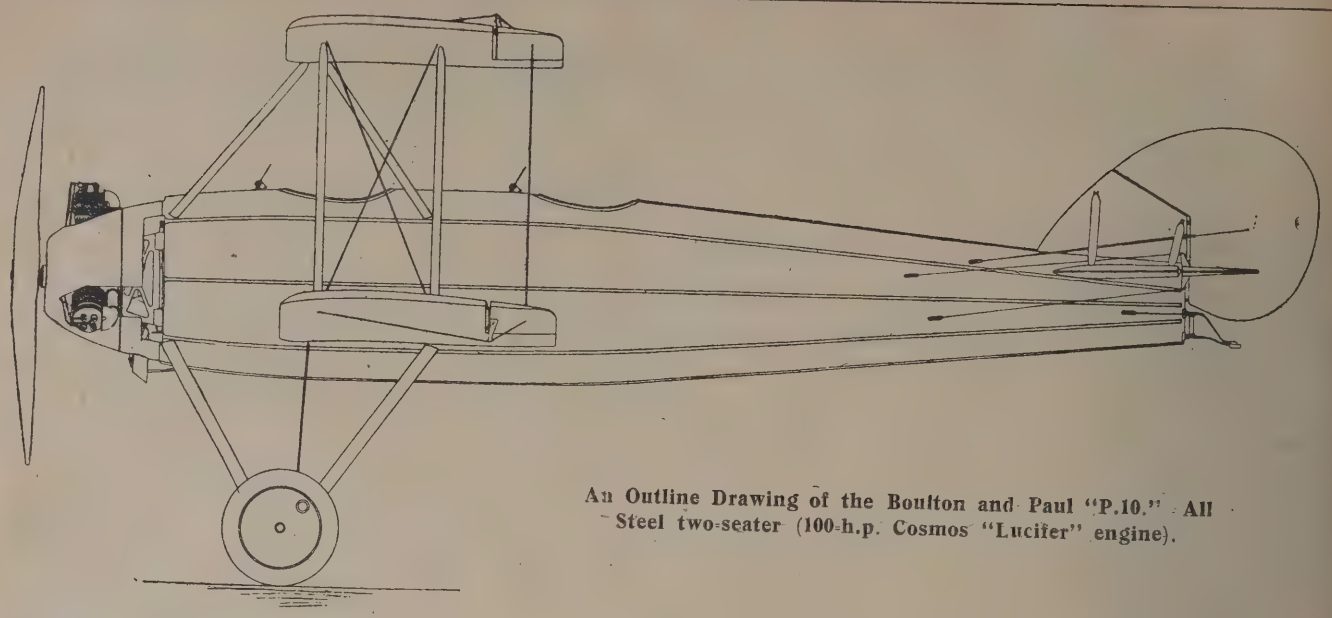


Fore End of the Fuselage of the Boulton and Paul P.10.

With the steel sections available, an actual all-metal machine has been produced—the construction being entirely novel, and meeting all the necessary conditions desirable for aircraft for use in any part of the world.

The machine is similar in size to the firm's standard P.9 model, being a two-seater tractor, and having all the aerodynamical features of this approved design.

Considering the detail construction of the all-metal machine, the fuselage is built up of hoops and longitudinals suitably placed, both being of special rolled steel sections; between the hoops and longitudinals is interposed and riveted a special fibre sheet, a material possessing mechanical properties particularly suitable for this work. The fuselage when complete is very light and gives a good low resistance shape.



The fin is built integral with the rear portion of the fuselage, the rear fin post carrying the rudder in the usual manner.

The Steel Fuselage of the Boulton and Paul P.10, in course of construction.

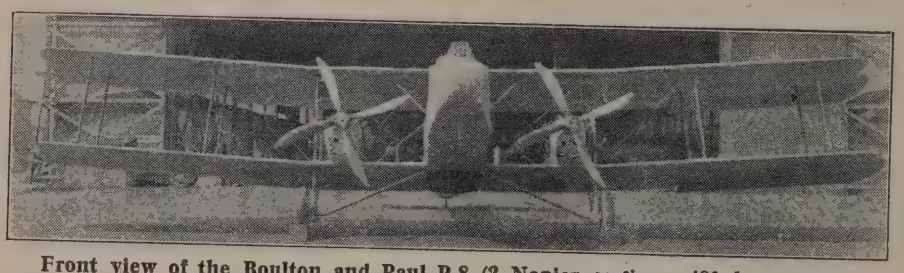
The wings, flaps, tail plane, elevator and rudder are constructed from rolled sections, each member being specially designed to fulfil its own particular function; the spar section in particular is that chosen as most suitable after a series of tests had been carried out on different sections, extending over a long period.

The 100-h.p. "Lucifer" engine is fitted as the power unit, and is carried on a mounting so arranged that by removing the vertical hinge pin on one side the whole engine and

An Outline Drawing of the Boulton and Paul "P.10." All Steel two-seater (100-h.p. Cosmos "Lucifer" engine).

mounting may be swung about the opposite vertical hinge, thus allowing easy access to the back of engine for inspection, and for making any necessary adjustments. With this arrangement, the controls, pipe lines, etc., are so designed that they do not require disconnecting when swinging the engine mounting.

The complete machine is undoubtedly an entirely new departure from standard practice, and it is claimed that it fulfils all the functions required of an all-metal machine, giving a high factor of strength combined with lightness, which has hitherto been unobtainable in this class of aeroplane.



SPECIFICATION.

Engine—	
Cosmos "Lucifer" type	100 h.p.
Air-cooled, fitted with four-bladed airscrew	7 ft. 6¼ in. dia.
Performance—	
Speed, fully loaded, 104 m.p.h. at	1,000 ft.
Climb, fully loaded, to 5,000 ft.	8 min.
Ceiling	14,000 ft.
Weight—

THE BOULTON AND PAUL "P.8."

The Boulton and Paul P.8 was originally designed for the Atlantic flight and is more or less a peace-time and improved version of the Boulton and Paul "Bourges" twin-engined bomber and fighter. As the only erected machine stands, at present, there is no definite accommodation for passengers and goods, as it is the actual machine built for the Atlantic flight, but Boulton and Paul, Ltd., propose to fly and test the machine as it stands before definitely arranging the interior accommodation.

Constructionally the machine follows general practice. The fuselage is built up in the usual way, having four longerons, cross-strutted and braced with standard tie-rods. Tubular rivets are used throughout instead of the ordinary threaded bolts. From the top longeron, which is level when the machine is in flying position, a series of bridges and runners carry the fairing right up so that the gap between the planes is entirely filled. Under the centre-section of the planes, and in the fuselage is carried the main petrol tank, which has a capacity of 210 gallons, the feed to the engines being by gravity from the main tank.

Front view of the Boulton and Paul P.8 (2 Napier engines, 480 h.p. each).

One of the All-Steel Wings of the Boulton and Paul "P.10."

The nose of the machine, which is finished off by a circular nose-piece made of veneer and fabric, carries the pilot. In rear of the pilot, and in front of the main tanks there is accommodation for three passengers. Behind the main tanks and aft the main planes four passengers can be carried. Above the pilot's head is a wind screen arrangement which can be opened or closed at will. Owing to the shape of the nose there is absolutely no draught felt at all when the pilot is flying without a wind screen, the protection being provided more or less for comfort in so far as the temperature of the atmosphere is concerned.

Control is normally by wheel and rudder-bar, but it is possible by an ingenious arrangement to lock the lateral and longitudinal control surfaces and steer entirely by means of the wheel control. This is a great advantage, especially for long-distance flights.

On the left-hand side of the pilot is a wheel for lowering and raising the radiator, on the right-hand side are two wheels, the rear one for setting the auxiliary fins on the elevators in order to offset the unequal pull and the consequent loss of directional control should one engine cut out, and the other for controlling the angle of inci-

THE COMMAND OF THE AIR.—A skilfully arranged Official Photograph, showing a formation of Bristol Fighters over the Italian Alps.

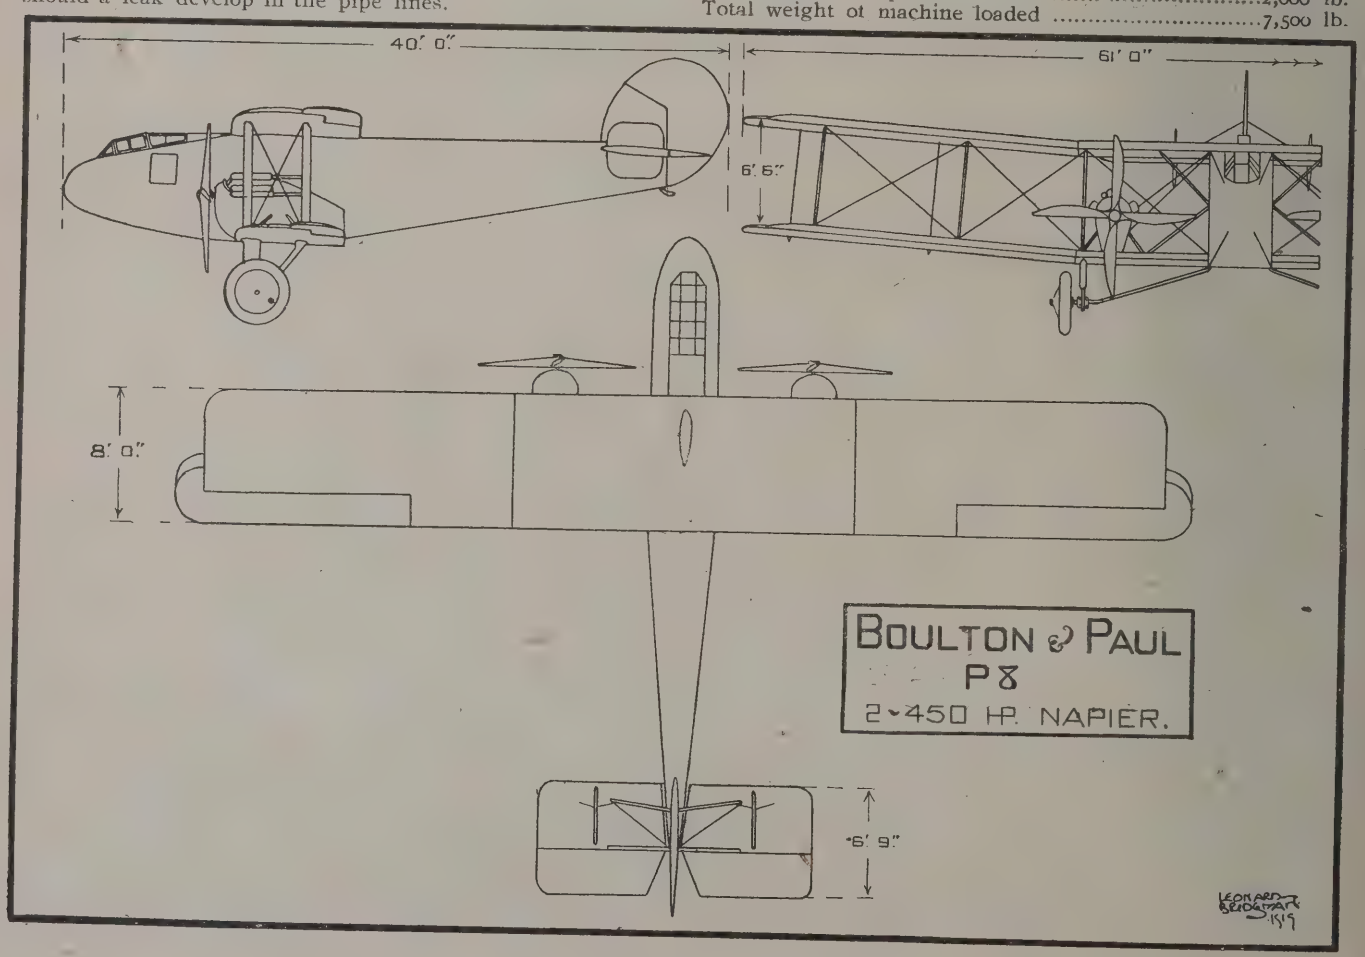
dence of the tail-plane. On the left-hand side are the two sets of engine controls, the rear pair being for ordinary adjustment, whereas the front pair are for altitude control.

In addition to the ordinary instruments carried, are two electrical revolution counters, the main mechanism for which is carried in the engine housing—the connection to the indicators in the cockpit being by ordinary electric cable. In the event of these instruments failing two supplementary dials of large size are carried on a board, one above each engine housing, which can easily be seen from the pilot's cockpit. Two oil pressure gauges are also carried on each board, which is covered by a hood and fitted with an electric bulb for night flying.

The Boulton and Paul P.8 Machine (two Napier engines, 450 h.p. each).

The two Napier engines are carried on bearers of light but strong construction resting on the lower plane. The bearers are made of a wooden framework covered with plywood, the engine feet being carried on steel channel bearers. The engines are coverd in with a neat cowling of aluminium in the rear of which are carried the main oil tanks. A self-starting magneto is also carried in the rear of each engine.

The engine beds are braced to the fuselage by diagonal tubes which, with the wire bracing, form a perfect triangulation.



The engines are fitted with exhaust manifolds of Boulton and Paul's own design, each manifold consisting of four aluminium castings which have cooling fins cast on them, the joints being sealed with asbestos washers. A pipe with a closed end, but slotted throughout its length, is fitted on the rear of this manifold, and almost completely silences the engines. The main planes are of equal span, and all four planes are fitted with balanced ailerons. The tail unit consists of a large balanced rudder and fin, a rectangular tail plane and unbalanced elevators together with the two controllable fins carried on the tail plane as already mentioned.

The undercarriage consists of two Vees, one under each first set of interplane struts. The cross axle is hinged at the centre to the two bottom longerons of the fuselage and carries at each end one large size Palmer aero wheel. The springing is partly by rubber cord and partly oleo-pneumatic.

The main radiator is carried under the fuselage and is controlled from the pilot's cockpit. Although the one radiator takes the cooling water for both engines, it is possible, by means of a series of four valves to cut out one side completely should a leak develop in the pipe lines.

Specification.

Type of machine	Twin-engined Tractor Biplane.
Purpose for which intended	Passenger and Commercial.
Span	59 ft.
Gap	6 ft. 6 in.
Overall length	40 ft.
Maximum height	12 ft. 4 in.
Chord	top plane, 8 ft.; bottom plane, 6 ft. 6 in.
Total surface of wings	770 sq. ft.
Span of tail	16 ft.
Total area of tail	96 sq. ft.
Area of elevators	96 sq. ft.
Area of rudder	21 sq. ft.
Area of fin	14 sq. ft.
Area of ailerons	27 sq. ft.
Engine type and h.p.	two 450 h.p. Napier "Lion."
Airscrew, diameter and revs.	9 ft. 6 in.; 1,450
Weight of machine empty	4,000 lb.
Load per sq. ft.	9.75 lb.
Weight per h.p.	8.34 lb.
Tank capacity in hours	4 hr.
Tank capacity in gallons	210 gall.
Performance—	
Speed at 10,000 ft.	149 m.p.h.
Speed at 15,000 ft.	142 m.p.h.
Landing speed	54 m.p.h.
Climb—	
To 10,000 ft. in min.	8 min.
To 15,000 ft. in min.	15 min.
Disposable load apart from fuel	2,000 lb.
Total weight of machine loaded	7,500 lb.

WESTLAND

If you are visiting the Paris Aeronautical Exhibition we shall be pleased to show you the Westland "Limousine" on Stand 20.

We shall also have another machine at Le Bourget Aerodrome for giving demonstration flights.

Above is illustrated the model we intend to exhibit. The first machine, which has been flying since last July, has proved an ideal machine for mail carrying or passenger transport-de-luxe.

For full particulars and arrangements as to trial flights apply to our London Representative, **Lieut.-Colonel C. H. MEARES,** c/o MESSRS. PETTERS LIMITED, 6, DEAN'S YARD, WESTMINSTER, LONDON, S.W.1.

THE GOSPORT AIRCRAFT COMPANY.

Front Elevation of the Gosport "G.5" Flying Boat.

The flying-boat programme of the Gosport Aircraft Co. for the year 1920 was arranged in conjunction with the late Col. J. C. Porte, C.M.G., who joined the staff early in August, 1919. Several new designs were produced, and the types which had proved so successful during the late war were considerably improved and modified to suit commercial requirements.

In this way four types were evolved, consisting of a large, a medium, and two smaller flying-boats.

It is unnecessary to describe in detail each type, as the general features are similar in all models. It is proposed, therefore, to describe briefly the medium sized flying-boat known as the "G.5," and then to indicate any particular features or departures in the other types.

THE GOSPORT "G.5."

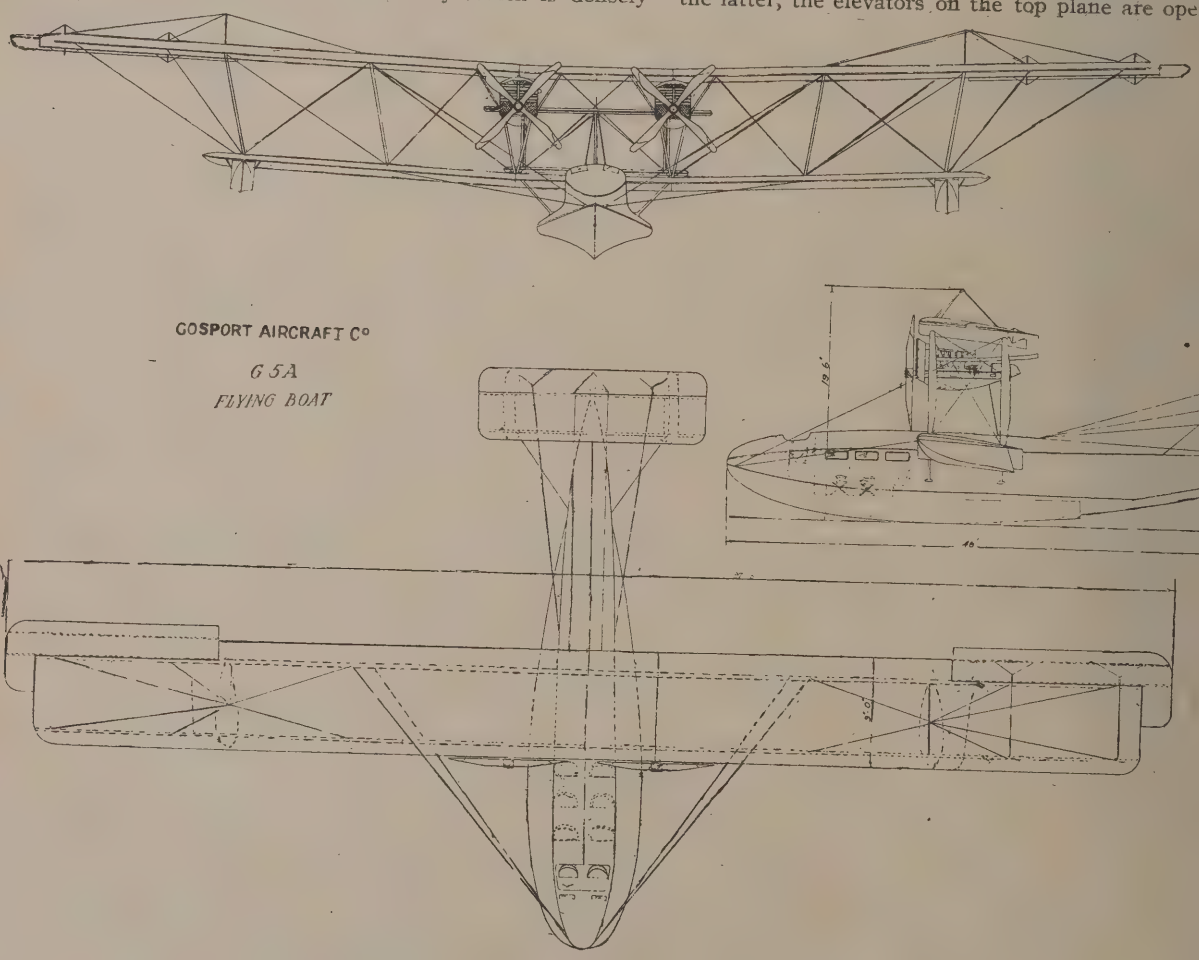
This flying boat was designed to fulfil the requirements of two quite distinct specifications in which moderately high speed was common to both. Owing to the roomy hull it will be realised that the same boat may be used for a variety of purposes, provided the same aerodynamic qualities are retained throughout.

Such being the case this flying-boat was designed either as a carrier of passengers, mail and cargo, or either alone or alternately as a machine to operate in Canada or in U.S.A. for the purpose of locating forest fires and carrying personnel and fire-fighting appliances to the conflagration in the shortest possible time.

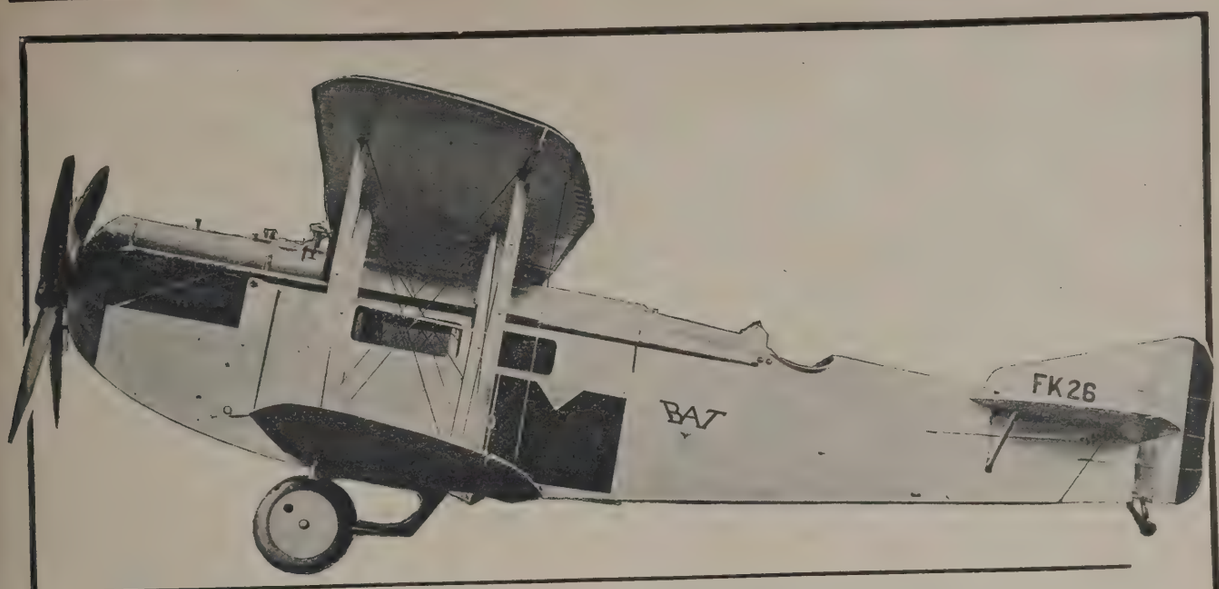
The utility of a flying-boat in a country which is densely wooded, but where there are numerous lakes and fairly broad rivers, is easily understood.

GENERAL.—The "G.5" is a twin-engined biplane, generally fitted with two 360-h.p. Rolls-Royce "Eagle VIII" engines, but either 450-h.p. Napier "Lions" or 500-h.p. Cosmos "Jupiters" may be fitted.

The top plane is of larger span than the lower plane, and is built up in five parts—a centre section, inner planes, and extensions.



The lower plane consists of two portions—a port and a starboard plane, attached to the hull at the wing roots. To the lower plane are fixed the wing tip floats, which are of boat type construction, double diagonal planking on the bottom and Saunders' Consuta plywood on sides.



The two engines are mounted between the planes in the usual manner.

The whole wing structure is secured to the hull transverse bracing unit, which is continuous from port to starboard and integral with the main fore and aft hull structure. This is a feature of all these type hulls, and possesses great advantages over any other type so far built. This point will be described in more detail later on.

In one model the wing sections immediately above the engines are removable without disturbing the main structure, thus greatly facilitating removal of the engines for overhauling, etc.

The tail unit may either be of monoplane or biplane type; if the latter, the elevators on the top plane are operated by the

THE IDEAL COMMERCIAL AEROPLANE

The machine here illustrated is the B.A.T—F.K.26—universally acknowledged to be the most practical and efficient commercial aeroplane yet produced. Although a relatively small machine—only 34 feet in over-all length—it possesses surprisingly commodious cabin and cargo accommodation. Four passengers can be carried comfortably, with ample room for personal luggage, or, alternatively, parcels or mails to the extent of 1,000 lbs. in weight and *150 cubic feet in capacity.*

Here are some additional interesting points concerning the machine :—

ENGINE :— 375 *Rolls-Royce Eagle VIII.*

SPEED :—45-120 *m.p.h.*

CABIN :—*Is clear of any transverse cross bracings or other obstruction, and measures 8 ft. by 3 ft. 3 ins. by 6 ft.—this in a machine of 34 feet over-all length. Direct entry off ground through ordinary door.*

LOAD :—*With 600 mile range of fuel*—1,000 *lbs.*

FUEL COST AT FULL LOAD: —7.2 *pence per mile.*

CHASSIS :—*A sturdy job, sprung by an unique combination of oleo and rubber shock absorbers.*

TAIL :—*Can be trimmed in flight from pilot's seat—steerable and practically unbreakable tail skid.*

GENERAL CONSTRUCTION : —*Straightforward — simple to repair and recondition.*

An impression of the interior of the cabin of the F.K.26.

The B.A.T. F.K.26 as a commercial machine has so many natural advantages, and is so moderate in first cost, that it is really *the ideal machine* to employ in inaugurating air transport services.

A demonstration flight can be arranged and all particulars obtained on application to :—

control column in the usual way, while the lower elevators, which are not connected to the upper ones, are operated by a lever on a quadrant situated at the side of the pilot and parallel to the control column. This arrangement has been found to be very satisfactory, the lower elevators being used for trimming in the same manner as an adjustable tail.

All flight controls, which are of the usual type, are balanced, with the exception of elevators. The use of servo motors has been found unnecessary.

Power Installation.—The engines are mounted on spruce bearers capped with ash, which in turn are supported by V struts between top and bottom plane spars.

The radiators are situated in front of engines and supported by the same bearers. They are fitted with shutters and thermometers, both connected up to the engineer's cockpit.

Inside the hull is carried a reserve water tank of ten gallons capacity, from which make up water is circulated to each radiator separately by means of a small hand rotary pump. The overflow from the radiators is led by a pipe therefrom to an open funnel leading to the above tank. This renders the amount of overflow clearly visible to the engineer.

A ten-gallon oil tank is fitted behind each engine.

The petrol system is positive feed from main tanks by means of two centrifugal pumps to gravity tank situated in the top plane, thence by gravity to engines. In the event of failure of this system, petrol may be fed direct to engines from main tanks. A hand pump of the semi-rotary type is fitted as a standby. The petrol overflow pipe from the gravity tank is led into the main petrol tank filling system and is selective, that is, it may be led into any tank at will, thus assisting to keep the machine trimmed.

The tanks are filled from a connection on the outside of the boat, thus keeping hull free from petrol.

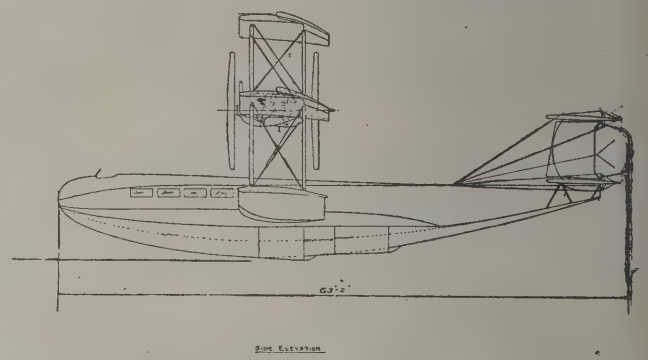
The two centrifugal pumps are incorporated in one casting which also forms a combined filter and change-over cock. The pumps, which are situated about two feet from bottom of tanks, are driven by a wind propeller through two sets of bevel gearing, thus doing away with a large suction head on the pump, and so minimising risk of air leakage into the suction side of the system. The filters, two in number, are so arranged that either may be removed in turn and cleaned without disturbing the flow through the pumps.

A pipe leads from the bottom of each tank to a combined pump and distributor box, thence through non-return valves to the pumps, via filters.

Hull.

The hull, which is of the latest "Porte" type construction, forms perhaps the most important feature of these flying-boats. Before describing in detail the construction, it may not be out of place to say a few words about them generally.

They were evolved as the result of extensive full-scale experiments carried out during the past five years As a proof of their sea- and air-worthiness it may be remarked that during a period of 18 months' operation of these boats from one seaplane station, a total of 198,600 sea miles were flown without loss of one life.



It may be described as a rigid compounded with the usual more or less flexible construction which follows high-speed motor-boat lines.

The sides are formed by two braced girders running from bow to stern, similar to the ordinary braced fuselage. The top is also braced in the same way, and is covered with fabric laid on formers to give a good streamline form. A deep built up keelson and a continuous keel run from bow to stern in the usual manner. Built-up floors connect up the keel to the two bottom longerons.

Timbers spaced about 9 in. apart run without a break from top longeron on one side, over keel to top longeron on the other side. The planking, which is double diagonal, runs from keel to top longeron on either side and is continuous round the fin chine, thus eliminating two joints which are always troublesome to keep water-tight. The steps, two in number, are detachable without interfering with hull planking, and are supported on fore and aft ash bearers.

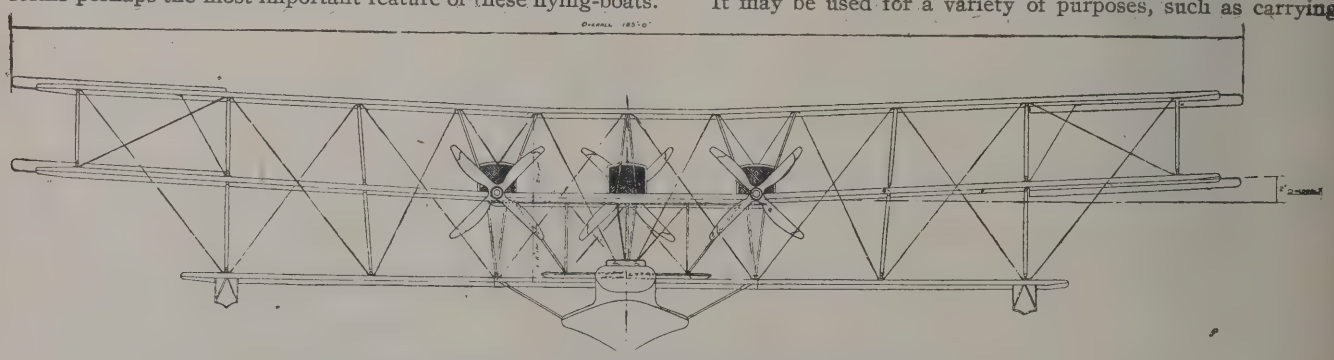
At the wing roots there is a complete transverse bracing unit under each spar connecting up port and starboard lower planes.

Two great advantages result from this construction. Firstly, all flight loads are directly coupled up in one complete structure, thus ensuring the machine keeping in truth—this applies especially to the angle between tail plane and main planes. Secondly, the resultant weight of the complete boat passes through the keel, thus avoiding distortion and local stresses when on the trolley.

Side Elevation.

Side Elevation of the Gosport "G.9."

Apart from the structural side of the design, the general lay-out is the result of full scale experiments, and has been found to be very satisfactory.



As in all engineering problems a compromise has to be made, and in this design it is believed the best has been attained.

Great care has been taken with detail design, resulting in maximum strength with a minimum of weight. A factor of loading of four is obtained throughout.

THE GOSPORT "G.8."

The "G.8" was produced to meet the demand for a small, handy, reliable flying-boat, in which a high speed was not essential. It has a very low-landing and getting-off speed, and owing to the fairly large hull is dry and seaworthy.

It may be used for a variety of purposes, such as carrying

small quantities of mails and cargo, and for police and patrol duties. It also makes an ideal training machine.

It is a pusher biplane fitted with one 270-h.p. Rolls-Royce "Falcon" engine.

The hull construction and lines are similar to the "G.5" already described.

The super-structure calls for no particular comment, apart from the centre section.

As with the "G.5," the top centre plane is quickly removable without disturbing the main planes, thus rendering the engine very accessible.

Otherwise, the machine is of very robust construction, and has a factor of loading of six throughout.

THE GOSPORT "G.8A."

The "G.8a," with exception of super-structure and engine, is identical with the "G.8." It was produced to fulfil the demand for a small fast flying-boat.

It may be fitted with either a 360-h.p. Rolls-Royce "Eagle VIII" engine, or a Napier "Lion," or a Cosmos "Jupiter."

THE GOSPORT "G.9."

This flying-boat was designed primarily to carry mails and valuable cargo long distances over the sea.

It is a triplane, and fitted with three 600-h.p. Rolls-Royce "Condor" engines, or two 1,000-h.p. Cosmos "Hercules" engines.

The general design is similar to the "G.5," and is designed to a factor of loading of four throughout.

THE BLACKBURN AEROPLANE AND MOTOR CO., LTD.

Mr. Robert Blackburn designed, built, and flew his first machine in 1909—a 28-ft. span monoplane with a 35-h.p. Green engine. Capt. Hucks took his ticket on the second Blackburn machine in February, 1911. Two Blackburn monoplanes took part in the "Circuit of Britain" with Capt. Hucks and Brig.-Gen. Conway Jenkins as pilots. Thereafter Capt. Hucks toured the West Country as a propaganda effort, and with great success. In the winter, 1911, the first all-metal Blackburn was built. The 80 Gnome type of the "West Country" tour was also flown by numerous well-known pre-war pilots, including Lieut.-Col. Blackburn, Mr. Pickles, and Lieut.-Col. Spenser Grey.

In the spring of 1914, the first War Office order was obtained—for B.E.s—and the present company was formed to deal with it. Simultaneously a seaplane (130-h.p. Salmson) was built for the "Round Britain" race.

During the war the Olympia works expanded rapidly to handle War Office contracts for B.Es. and the technical department grew simultaneously to cope with Admiralty experimental work.

An experimental triplane was followed by a series of experimental sea-going machines. The first of these was a twin fuselage all-purposes seaplane with twin 130-h.p. Clergets, and this was followed by the twin "Sunbeam G.P." type, later

Code—A.B.C. 5th Edition.

converted to Rolls-Royce "Falcons," and finally developed into the "Kangaroo" land machine, used for long-range anti-submarine patrol work.

Parallel with this, a series of experiments on torpedo carriers took place. The production side of the firm was building "Baby" seaplanes, and thence rose the Air Board's request to take over and develop the "Cuckoo" torpedo carrier. This was followed by the "Blackburd," and a further development, the "Kingfisher," was in hand at the time of the armistice, which also found a small flying-boat, the "Nib," well under way.

The end of the war found the firm with a large up-to-date works at Olympia, organised for rapid production and high-grade workmanship; an experimental depot and seaplane base at Brough, near Hull; a highly skilled technical staff with wide design experience, and a large number of skilled workmen. In addition to its reputation for excellent design and construction, the firm had won a name for manufacture of standard fittings and accessories, and an associated company, Blackburn Aircarft Products, had been formed to handle this branch of activity.

A Blackburn "Kangaroo" at the E.L.T.A. Exhibition (Amsterdam).

Since the war the firm has adopted the definite policy of remaining in the Aircraft Industry, whilst adopting non-aircraft work to employ its surplus facilities. The Olympia works have been diverted to automobile work on a production basis, thus enabling the retention of the high-skilled staff on the aircraft side. The Brough depot has been allocated to experimental aircraft work and the technical staff is fully engaged on the new problems of peace aviation. It is not expected that the aircraft side of the firm can be run at a profit for some while, but it is believed that such work is necessary and will in the long run prove wise, and that without such work the technical and commercial peculiarities of peace flying cannot be properly met. The choice of automobile work as a subsidiary line of business was, it may be stated, guided by the fact that such work enables a continuity of factory organisation and easy re-diversion to aircraft work at need.

POST-WAR ACHIEVEMENTS.

The reorganisation of the Olympia works has naturally occupied a large share of the firm's activities during the past year, but a certain amount of aircraft work has been carried on with success. Conversion for commercial duties has been planned and executed on the "Kangaroo," "G.P." seaplane, and "Blackburd" types. The "Kangaroos" have been flown with much success by the North Sea Aerial and General Transport, Ltd., with whom the Blackburn Aero and Motor Co. have been associated to a considerable extent. This flying will be dealt with below. In addition a "Kangaroo" has been selected by one of the parties competing in the flight to Australia and has up to the present date achieved a distance of 1,300 miles without any defect arising in the machine. A model of the commercial pattern "Kangaroo" will be on exhibition in the Paris Show.

Work in hand at Brough includes among other items a certain amount of experimental construction for the Air Board, some private experimental work of great promise which may very appreciably simplify the "ton-miles per shilling" problem, and the design and construction of a further development of the "Kangaroo" for the use of the Cope Antarctic Expedition.

The work in which the Blackburn Aero Co. have been associated with the North Sea Aerial and General Transport, Ltd., of which the manager is Major Veal, comprises a considerable amount of general flying and two successful passenger-carrying seasons—at Scarboro' and the E.L.T.A., Amsterdam. The bulk of this flying has been made with a small fleet of commercial Kangaroos. One of these machines acted as mail carrier on the London-Glasgow route during the railway strike.

Three of them were at the E.L.T.A., and there carried over 1,000 paying passengers without the least mishap, and received excellent notices for their commercial capabilities. Statistics based on this season at Amsterdam show that the "Kangaroo's" running costs were very reasonable, even for such uneconomical work as "flipping." The North Sea Aerial and General Transport, Ltd., are making arrangements for the institution in the near future of regular services across the North Sea and propose to employ "Kangaroos" for this work.

A schedule of data for present Blackburn models is given below :—

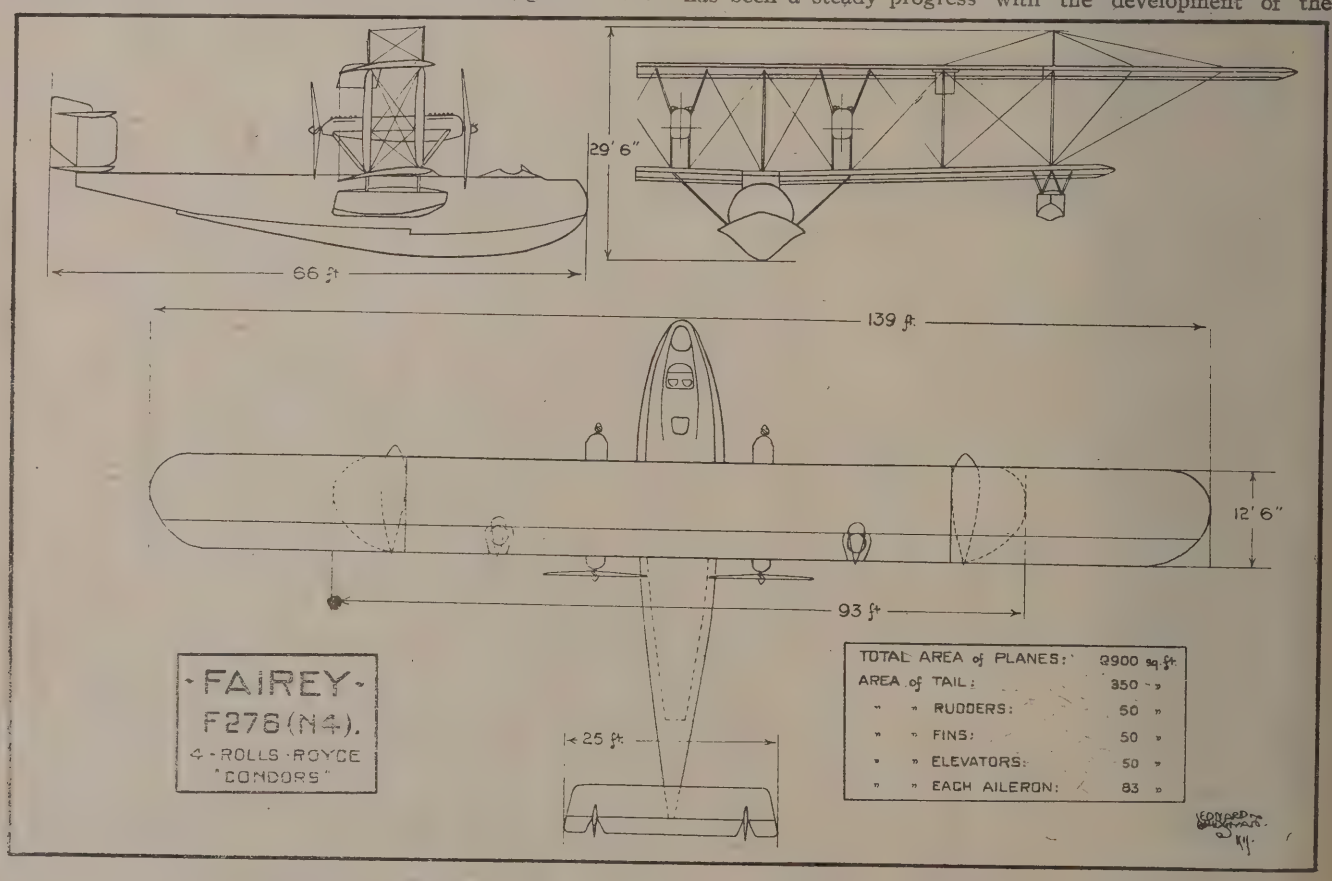
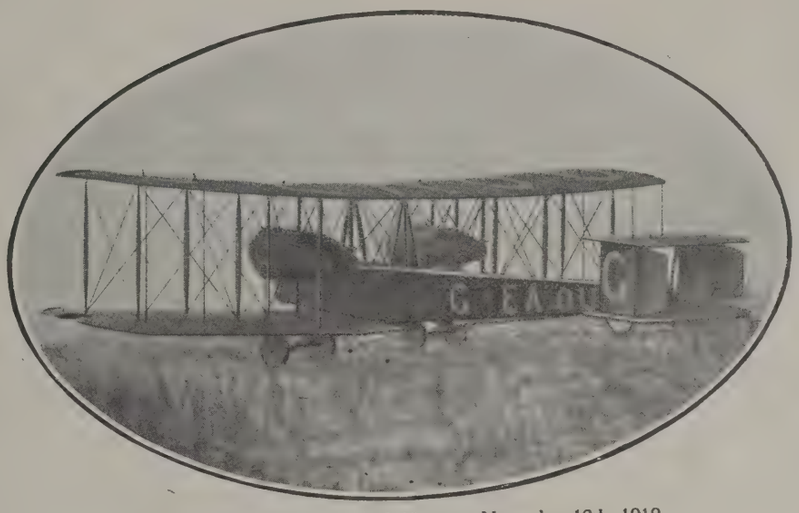
THE FAIREY AVIATION CO., LTD.



On the Left two Views of the Fairey Machine entered for the Schneider Cup Contest. On the Right the same Machine fitted with the Standard Type 3 Wings. A Napier engine is used.

Founded in 1915 by Mr. C. R. Fairey, the Fairey Aviation Co. have since then shown themselves to be in the front rank of British aircraft constructors.



Generally speaking, the Fairey Company have been associated with the manufacture of seaplanes, but it must not be forgotten that one of their earliest successful designs was the Fairey "Fighter"—one of the first of the large twin engine type of aeroplane to be successfully flown and to perform.

Mr. Fairey's earlier design efforts were more or less designed on "high lift" wing lines, from which position there has been a steady progress with the development of the

Fairey patent variable camber gear, which enables the low landing and high climbing speed of the high lift wing to be used while retaining the high speed of the low resistance type of wing.

The value of this development is shown by the fact that with a standard seaplane of very robust construction, loaded to 11 lb. per sq. ft. and to 15 lb. per h.p., a speed of 112 miles per hour, and a climb to 5,000 ft. in 6½ min. has been reached with a Fairey machine.

The Fairey seaplanes of the two-float type are machines of sturdy build. One of them, N.10 was delivered to the R.N.A.S. in April, 1917, and was repurchased by the Fairey Co., fitted with a Napier engine, and was flown in the Schneider Cup Competition with the original parts, even to the floats.

A Standard Fairey Type 3 Seaplane, fitted with an amphibian undercarriage.

A Fairey Seaplane about to get off the Thames at Isleworth.

These seaplanes have been developed on the lines of an interchangeable series—i.e., a standard fuselage may be fitted with any one of certainly three sets of wings, two float undercarriages, and two sizes of float suited to use as a fast two-seater or as a moderate speed load carrier, or either a wheel undercarriage or one fitted with skids and flotation gear for use from ships' decks. Practically all the components of the different wings or undercarriages are interchangeable—with an immense reduction in the number of spares necessary for running machines on different types of service.

Beside the range of machines referred to above, the Fairey Aviation Co. have been responsible for the design of the N4 flying-boat to Royal Air Force specification, intended for work with the fleet at sea. Two of the machines—fitted with four Rolls "Condor" engines of 640 h.p. each—are being built by the English Electrical Company, Ltd., one being ready for the engines, and a third has just been ordered from the Fairey Company.

THE SOPWITH AVIATION AND ENGINEERING CO., LTD.

The Sopwith "Wallaby"—a Special Version of the Transport Type built for the Australian Flight.

The Sopwith Aviation Co. were, during the war, probably responsible for more divers types of aircraft than any other firm. Their experience as that of pioneer designer-constructors covers all types of heavier-than-air craft from flying-boats and seaplanes to land machines.

Furthermore, they have built, and have standardised, everything from bombers and torpedo-carriers to high-speed scouts, and in every type they have attained eminence.

With the passing of the war and the transition to peace the enormous war output of fighting aircraft is no longer required. The Sopwith Co. is by no means disposed to rest on its laurels, and testimony to this effect is furnished by the introduction of three new commercial types of aircraft: the "Dove," the "Gnu," and the "Transport."

Nor is there any reduction of energy in the immediate future. The company's design and experimental department is being maintained at its full strength and is as busy as ever. Some interesting developments are likely to be heard of in the near future.

THE "TRANSPORT."

The "Transport" is an ordinary single-engined tractor biplane and can be adapted for use either as a cargo machine or for the purpose of conveying passengers. In the former case accommodation is provided for one pilot and passenger, with 1,500 lb. of cargo; and in the latter arrangements are made for carrying five passengers and one pilot, four passengers being carried in the centre of the machine and one in the pilot's cockpit, behind the wings.

Petrol is carried for six hours at a cruising speed of 90 miles per hour in the case of the passenger-carrier, and when adapted for use as a cargo machine fuel is provided for eight hours at a cruising speed of 90 miles per hour.

It is of interest to note that the "Transport" is practically identical with the machine upon which the Atlantic Flight was attempted last May, and is also very similar to the "Wallaby" upon which Capt. Matthews started to fly to Australia.

The following particulars are common to both passenger and cargo types:—

Engine	"Eagle 8" Rolls-Royce.
Speed	115 m.p.h.
Weight of machine fully loaded	5,500 lb.
Factor of safety	6.5
Ratio of useful load to total weight	46 p.c.
Span	46 ft. 6 in.
Height	12 ft.
Overall length	28 ft.
Chord	6 ft. 3 in.
Stagger	3 in.
Area of main planes	547 sq. ft.
Dihedral	2½ deg.

HIGHLY IMPORTANT SALE

OF

SURPLUS MATERIALS AND STORES

AT

MESSRS. MORGAN & CO.'S WORKS at LEIGHTON BUZZARD,

to provide the necessary accommodation for the

Mass Production of the New Patent Construction All-Metal Motor Bodies.

HENRY BUTCHER & Co., F.A.I.,

Have received instructions from MESSRS. MORGAN & CO., LTD., to Sell by Auction, on the Premises, LEIGHTON ROAD, LINSLADE, LEIGHTON BUZZARD, close to LEIGHTON BUZZARD STATION, L. & N.W. Railway,

On JANUARY 14th, 15th, 16th, 1920,

THE EXTENSIVE VALUABLE AND NEARLY NEW

SURPLUS PLANT, STORES,

MACHINE TOOLS AND MOTOR STOCK,

COMPRISING

TIMBER SECTION

About 100 STANDARDS OREGON PINE. 5,000 THREE-PLY BOARDS of Extra Aircraft Quality, ⅛ in. to ¼ in., passed A.I.D. 50 STANDARDS ENGLISH ASH. 500 cubic feet WALNUT, MAHOGANY PANELS. Several Hundred TRESTLES, BENCHES, RACKS, CASES, and large quantities of Useful TIMBER.

MACHINE TOOL SECTION

14 Sensitive, Bench, and other DRILLING MACHINES, by Burton Griffiths, Monninger, Churchill, Baines, and others. 4 TOOL GRINDING MACHINES, by Lindley, Holbrook, Goodall, Platt and others. 1 TWIST DRILL GRINDING MACHINE, 1 UNIVERSAL ditto. BUFFING MACHINE, by Canning. 10 S.S. and S.C., CAPSTAN, TURRET, and other LATHES, by Holbrook and others. 1 AUTOMATIC, by Flather. 2 SHAPING MACHINES, 2 POWER HACKSAWS, 2 PUNCHING and SHEARING MACHINES, 1 WOOD BORING ditto. NIBBLING MACHINE, by Burton Griffiths. COKE BREAKING MACHINE, CENTERING MACHINE. C.I. POWER FRAME. MILLING MACHINE, by Holbrook. 1 R.A.F. WIRE ROLLING MILL, by Herring and Son. 1 BAND SAW for METAL. HARVEY FROST VULCANISER. SINGER'S SEWING MACHINE.

MOTOR-CAR SECTION

2 S.H. 12/16 ADLER TOURING CARS, Complete with Cape Cart Hoods and Wind-screens; MAGNETOS, WINDSCREENS, SPEEDOMETERS, SEATS, BODIES, DOOR HINGES, LOCKS, FASTENINGS, HINGES, 2 ADLER 30/40 H.P. ENGINES, and a quantity of ACCESSORIES AND PARTS.

METAL SECTION

20 tons HEXAGON and ROUND STEEL, in standard sizes; 100,000 feet STEEL TUBES, A.I.D. APPROVED, assorted sizes; 1 ton DURALUMIN RODS, TUBES, and SHEETS; 6 tons BRASS and COPPER RODS and TUBES, 3/16 in. to 2 in.; 5 tons ALUMINIUM CASTINGS; 5 cwt. RIVETS.

VARNISH & PAINT SECTION

Several tons ready mixed WHITE and other PAINTS, by well-known makers; 1,000 gallons VARNISHES, DOPE; 25 cwt. LIQUID GLUE (Croid).

AIRCRAFT SECTION

Large Quantities of PROPELLERS, WINGS, AILERONS, CENTRE SECTIONS, AIR PUMPS, COCKS, NIPPLES, BUSHES. 182 Large LANDING WHEELS (with 900 x 200 Palmer Tyres), SCREENS, SHUTTERS, STREAMLINE WIRES, RENAULT CHAINS, TURNBUCKLES, PETROL TANKS up to 140 Gallons, TIE RODS, 150 RADIATORS, SHUTTERS, STEERING WHEELS, 600 SKEFFKO BALL BEARINGS, 1 ton FLEXIBLE STEEL CABLE, 13 STEEL NACELLES, several tons BOLTS and NUTS, WASHERS, SPROCKETS, SOCKETS, SHEET CELLULOID, RUBBER CONNECTIONS, ROTAX HOSE CLIPS, and an enormous assortment of STAMPINGS and CASTINGS in ALUMINIUM, STEEL, GUN METAL, and various ALLOYS.

GENERAL

2 cwt. SCOTCH GLUE, 50 GLUE POTS (assorted). 20,000 gross NETTLEFOLD'S SCREWS in Brass, N.P., and Iron (assorted). TUCKER'S ELECTRIC SWITCHES. Several tons ALUMINIUM, COPPER, BRASS, CAST and WROUGHT IRON SCRAP. 20,000 gross ASSORTED LINEN and EGYPTIAN TAPES. ELASTIC SHOCK-ABSORBER CORD, and an extensive miscellaneous assortment of Materials and Stores as used in Aircraft and Carriage Manufacturing.

On View Two Days preceding and Mornings of Sale.

CATALOGUES, when ready, 1s. each, and all information from Henry Butcher & Co., Auctioneers and Valuers to the Engineering and Allied Trades, 63 and 64, Chancery Lane, London, W.C.2. 'Phone: Holborn 2295 (5 lines). Telegrams—Penetran Holborn, London.

THE "DOVE."

The "Dove" is a two-seater version of the famous "Pup," one of the most delightful of Service machines as far as ease of flying is concerned.

Generally speaking, all dimensions are practically the same in both machines. In the "Dove" the span is cut down by 1½ ft. and the overall length is increased by a few inches.

This machine produced as a sporting two-seater should prove a great favourite for general utility and stunt flying.

SPECIFICATION.

Purpose .....Sporting two-seater.
Engine .....80-h.p. Le Rhône.
Speed .....100 m.p.h.
Speed variation .....60 m.p.h.
Climb .....5,000 ft. in 7½ min.
Range .....Full throttle, 200 miles, cruising speed, 250 miles.
Maximum safe load .....665 lb. (normal load, 365 lb.).
Weight of machine fully loaded .....1,430 lb.
Factor of safety 6
Ratio of useful load to total weight .....27.6 p.c.
Span .....25 ft.
Height .....9 ft. 6 in.
Overall length .....19 ft. 6 in.
Chord .....5 ft. 1½ in.
Gap .....4 ft. 6 in.
Stagger .....1 ft. 4 in.
Dihedral .....3 deg. (both planes).
Loading .....6.7 lb. per sq. ft.

The Sopwith two-seater "Dove" (80 Le Rhône engine).

THE "GNU."

The "Gnu" is a larger version of the "Dove" and is furnished with enclosed accommodation for the two passengers who are carried in rear of the main planes. The pilot is situated well forward under the centre section which is provided with a large opening for easy ingress and egress to the pilot's cockpit. Two sets of struts are fitted either side of the fuselage.

The construction and general arrangement of the machine is on normal and accepted lines. Either a 200-h.p. B.R.2 or an 110-h.p. Le Rhône engine can be fitted.

The Sopwith "Gnu," enclosed three-seater (B.R.2 engine).

SPECIFICATION.

Purpose.....Light high-performance goods or passenger machine.
Engine.....200-h.p. Bentley rotary.
Speed .....110 m.p.h.
Speed variation .....65 m.p.h.
Climb—
5,000 ft. in 5½ min.
Range .....Full throttle, 200 miles; cruising speed, 250 miles.
Maximum safe load .....820 lb.
Weight of machine fully loaded .....2,400 lb.
Factor of safety 6
Ratio of useful load to total weight .....34.1 p.c.
Span .....38 ft.
Height .....10 ft.
Overall length .....25 ft. 6 in.
Chord .....5 ft. 6 in.
Gap .....5 ft.
Stagger .....11 in.
Dihedral .....Both planes 2½ deg.
Loading .....6.85 lb.

SPECIFICATION (WITH 110-H.P. LE RHONE).

Purpose...light high-performance goods or passenger machine.
Engine .....110 h.p. Le Rhône.
Speed .....93 m.p.h.
Speed variation .....53 m.p.h.
Climb .....5,000 ft. in 7¾ min.
Range.....full throttle, 220 miles; cruising speed, 300 miles.
Maximum safe load.....1,202 lb. (normal load, 845 lb.)
Weight of machine fully loaded 2,160 lb.
Factor of safety 6
Ratio of useful load to total weight 39.1 p.c.
Loading.....6.1 lb. per sq. ft.

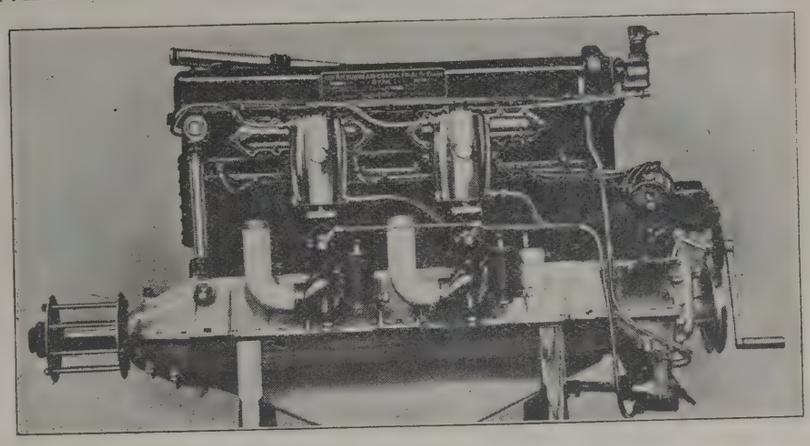
The Schneider Cup Machine.

The following are particulars of the machine built by the Sopwith Aviation Co. for this year's Schneider Cup competition, and which has now been fitted with a land undercarriage of the customary type :—

Engine ...Cosmos "Mercury," 450 h.p.
Chord .....5 ft. 1½ in.
Span .....24 ft.
Gap .....4 ft. 6 in.

The Sopwith Schneider Cup Seaplane (450-h.p. "Jupiter" Cosmos engine).

Total length over floats .....22 ft.
Backward stagger .....2½ in.
Floats .....Plain longitudinal without step.
Estimated speed (as a land machine).....170-175 m.p.h.
Weight .....Approx. 2,200 lb.



It is believed that the above machine will prove to be the fastest in the world when "tried out" as a land machine.

THE SUNBEAM MOTOR CAR CO., LTD.

The four engines to be exhibited by the Sunbeam Company at the Paris Show have many similar characteristics, but differ in important details other than those of size and power. To take the first of all those points in which the engines are similar will perhaps be the best plan. The four engines in question bear the usual tribal names of Sunbeam-Coatalen aircraft engines and are of the following range of horse-power :

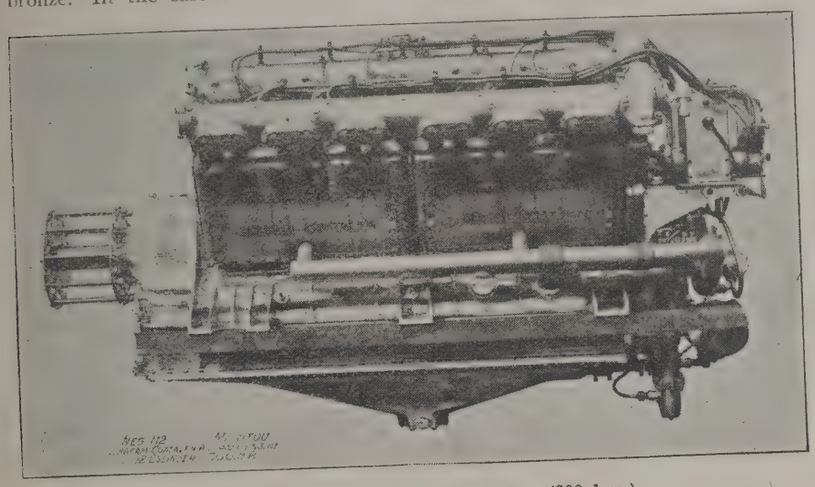
"Dyak" ..... 100 h.p.
"Manitou" ..... 300 h.p.
"Matabele" ..... 420 h.p.
"Sikh" ..... 800 h.p.

All these engines are composed of similar materials for similar parts, with one exception, which will be noted later. The crankshafts are of nickel chrome steel, the pistons being of aluminium. The valves are of high chrome steel, of a special form and designed to withstand heat and prevent distortion, and the valve gearing is of self-hardened nickel chrome steel. The cylinder blocks, with the exception of the "Sikh" engine, are of aluminium casting with very large water circulation spaces and inspection covers. The cylinders are fitted with steel liners and the valve seats are of bronze. In the case of the "Sikh" engine, however, the cylinders are composed of steel throughout, and are welded together with their jackets.

The Sunbeam "Dyak" Engine (100 h.p.)

The crankcases are in each case of aluminium casting and are of a patent form, designed to give greater strength and to allow the bearing caps to take a large share of the side load imposed on the crankshaft under the usual working stresses.

All these engines are of the water-cooled type, the circulation being in each case by centrifugal pump designed to give a specially large output. Lubrication in all types is by gear wheel pumps, three of these being employed :—



(a) A scavenger pump which draws the oil from the sump and returns it to the oil tank;

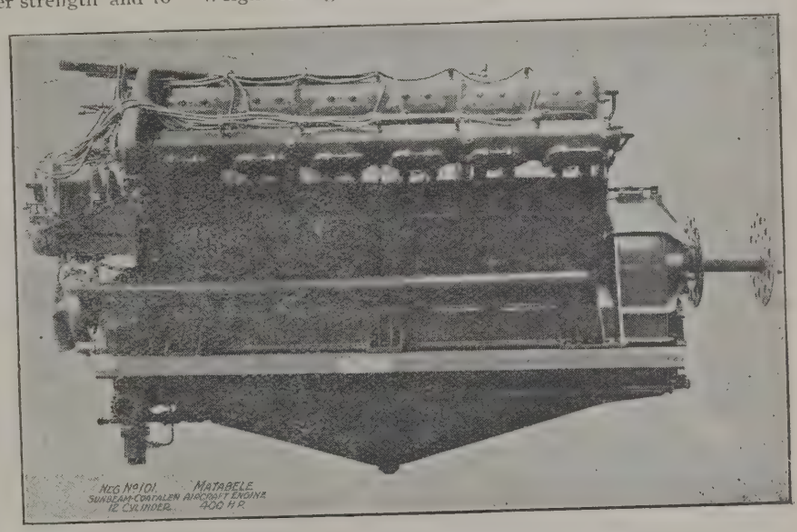
(b) The main force pump which forces oil through the drilled crankshafts and ducts in the crankwebs to the main bearings, drawing direct from the oil tank;

(c) The auxiliary oil circuit pump which forms a portion of the main force pump and is arranged to deliver the necessary quantity of oil at a very low pressure to the camshaft bearings and all auxiliary bearings.

Carburation is effected by Claudel-Hobson carburetters of diffuser type working under a head of pressure of 4 lb. per square inch.

Ignition is by high tension magnetos, and particulars as to the number of these are given in the details of each engine. The magneto drive is by a coupling formed of laminated spring blades giving great flexibility and ensuring a long life for the magneto.

The Sunbeam "Manitou" Engine (300 h.p.)



The "Dyak," "Manitou" and "Matabele" engines are each fitted with two sparking plugs per cylinder, the "Sikh" engine being fitted with four plugs per cylinder.

THE 100-H.P. "DYAK."

In the case of the "Dyak" 100 h.p. the engine is of the vertical type, the six cylinders being cast *en bloc* in aluminium, this casting being made in the Sunbeam company's own foundry and being one of the largest, if not the largest, yet made in this material. There are two valves to each cylinder, operated by one overhead camshaft, which is driven direct by bevel gearing to the crankshaft. This is carried on seven die cast white metal bearings, and drives the propeller direct, the thrust bearing being mounted on an extension of the crankcase. The carburetter is of the B.Z.S. 38 type, and is arranged for gravity feed. The starting of this engine is effected by hand.

The chief dimensions are as follows—

Bore ..... 120 mm.
Stroke ..... 130 mm.
Total stroke volume of cylinders ..... 8,820.5 cc.
Normal speed of engine ..... 1,200 r.p.m.
Fuel consumption ..... 0.54 pint per b.h.p. hour
Weight of engine "dry" ..... 390 lb.

The Sunbeam "Matabele" Engine (400 h.p.)

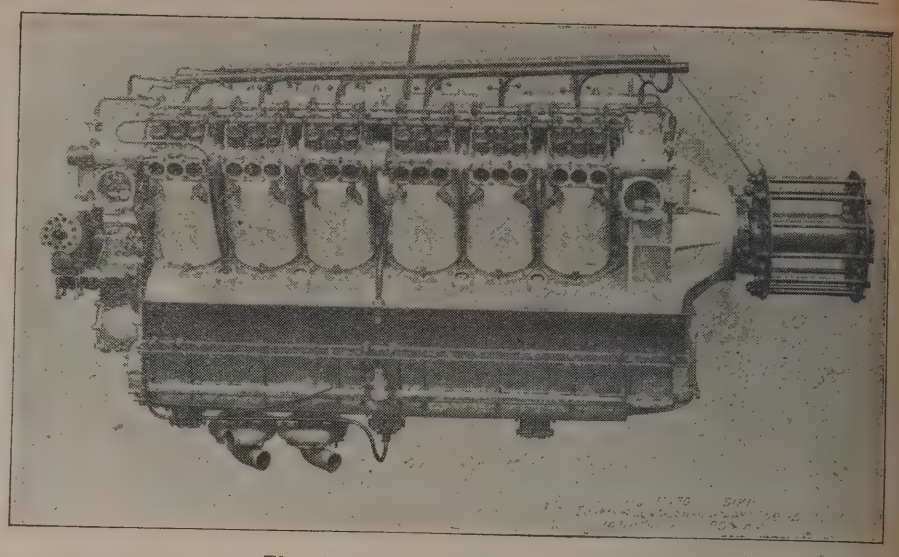
THE 300-h.p. "MANITOU."

The "Manitou" 300 h.p. is a 12-cylinder engine, the cylinders being cast in blocks of three and disposed on the crankcase in two rows of six each, the angle of inclination being 60 degrees. There are two inlets and two exhaust valves actuated by overhead camshafts, these being driven by trains of gears from the crankshaft. The connecting rods are of the usual "H" section and of the articulated pattern. The hollow crankshaft is carried on eight die cast white metal bearings, and the propeller is driven indirectly by gearing to the propeller shaft, which, with the thrust bearing, is mounted on an extension of the crankcase cast on the engine.

Carburation is by two Claudel-Hobson H.C.7 carburetters arranged for gravity feed and set in the centre of the "Vee." The magnetos employed are two of the B.T.H. A.V.12 type, driven from the trains of gears at one and a half times engine speed. Both electric and hand starters are fitted to this engine.

The chief dimensions are as follows :

Bore	110 mm.
Stroke	135 mm.
Total stroke volume	15,395 cc.
Normal speed of engine	2,000 r.p.m.
Fuel consumption	0.54 pint per b.h.p. hour
Ratio of reduction	1.57 to 1
Weight of engine "dry"	845 lb.



THE 400-h.p. "MATABELE."

The "Matabele" 400 h.p. engine is similar to the "Manitou" with regard to the general lay out, the cylinders being similarly cast and disposed on the crankcase. The valves are likewise four in number (two inlet and two exhaust), and the valve gearing is exactly similar to that of the above-mentioned engine.

The propeller drive is indirect, the gear reduction, ratio being in this case 1.63 to 1. Carburation is by means of two Claudel Hobson H.C.7 (twin type) carburetters arranged for gravity feed, and ignition is effected by means of four P.M.6 magnetos driven from the trains of gears. In this engine the starting is either by compressed air or by the hand starter.

The chief dimensions are :—

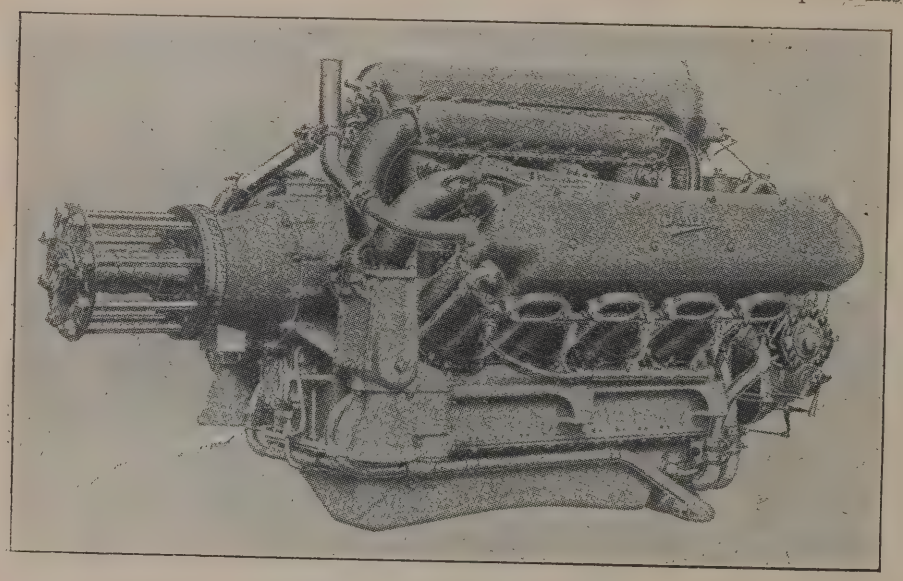
Bore	122 mm.
Stroke	160 mm.
Total stroke volume	22,429 cc.
Normal revolutions	2,000 r.p.m.
Fuel consumption	0.54 pint per b.h.p. hour
Weight of engine "dry"	1,000 lb.

The Sunbeam "Sikh" (800 h.p.)

THE 800-h.p. "SIKH."

The "Sikh" engine differs considerably from the other three. It has twelve separate steel cylinders, machined all over, and welded together with their jackets, the disposition on the crankcase being the same as in the smaller twelve-cylinder types. There are three inlet and three exhaust valves to each cylinder.

The valves are operated by push rods and rockers, actuated by a single central camshaft, driven, as usual, from the trains of gears. Eight die cast white metal bearings carry the hollow crankshaft, and the propeller shaft is driven indirectly by spur gear, the thrust bearing being mounted on an extension of the crankcase cast on the engine.



Carburation is effected by means of four Sunbeam Claudel carburetters of special form, two being situated at each end of the engine. Ignition is by four twelve-cylinder magnetos driven by skew gear and fitted with Vernier type coupling to allow of fine adjustment. Both hand and electric starters are fitted to this engine.

The chief dimensions are as follows :—

Bore	180 mm.
Stroke	210 mm.
Total stroke volume	64,113.6 cc.
Normal speed of engine	1,400 r.p.m.
Fuel consumption	0.51 pint per b.h.p. hour
Ratio of reduction	1.526 to 1
Weight of engine "dry"	1,952 lb.

D. NAPIER AND SON, LTD.

The Napier aero engine made its appearance too late in the history of the war to have any effect on the war in the air—though this fact was in no sense the fault of the designing firm, but was rather due to the operations of those in authority over aircraft engine production.

The 450-h.p. Napier Aero Engine.

Since peace has allowed it to display its capacity, it has shown itself to be in the very front rank of the world's aircraft power plants, and it will doubtless play an important part in the development of commercial aviation. It has already to its credit many very fine performances, Capt. Lang's well-known ascent with a passenger to some height not yet officially certified, but in the neighbourhood of 30,000 ft., the winning of the Aerial Derby, the establishment of 18 British speed records in one day are amongst them.

As is probably well known by this time, the engine is a three-row, broad arrow type, with 12 cylinders, giving 450 h.p. at 2,000 r.p.m., a speed which is brought down to 1,320 r.p.m. at the airscrew shaft by a reduction gear. The cylinders, each $5\frac{1}{2}$ in. bore by $5\frac{1}{8}$ in. stroke, are steel forgings, machined all over, with sheet steel water jackets attached thereto. The cylinder heads are of aluminium, the four heads of each row being cast in one piece, carrying valve seatings and the supports for the overhead camshafts, of which there are two—one for inlet valves and one for exhaust valves—to each row of cylinders.

GWYNNES

MANUFACTURERS AND SOLE LICENSEES IN THE BRITISH EMPIRE

"CLERGET" PATENT AERO ENGINES

ENGINEERS, LONDON.

"GWYNNE, LONDON." "HAMMERSMITH 1910."

The pistons are of aluminium alloy and are fitted with two gas rings and one scraper ring.

The connecting rods are machined from special high grade steel. The master rods are coupled to the pistons of the vertical block of cylinders, and have lugs on either side to which are attached the auxiliary rods from the right and left blocks of cylinders.

The crankshaft is machined from a solid steel forging, and has the four throws in one plane. It is carried in five roller bearings with one large plain bearing at the forward end.

The propeller shaft is carried on two roller bearings and is fitted with a large double thrust ball bearing.

The crankcase is of aluminium and carries at its front end the reduction gear for the propeller shaft, together with the shaft and its bearings.

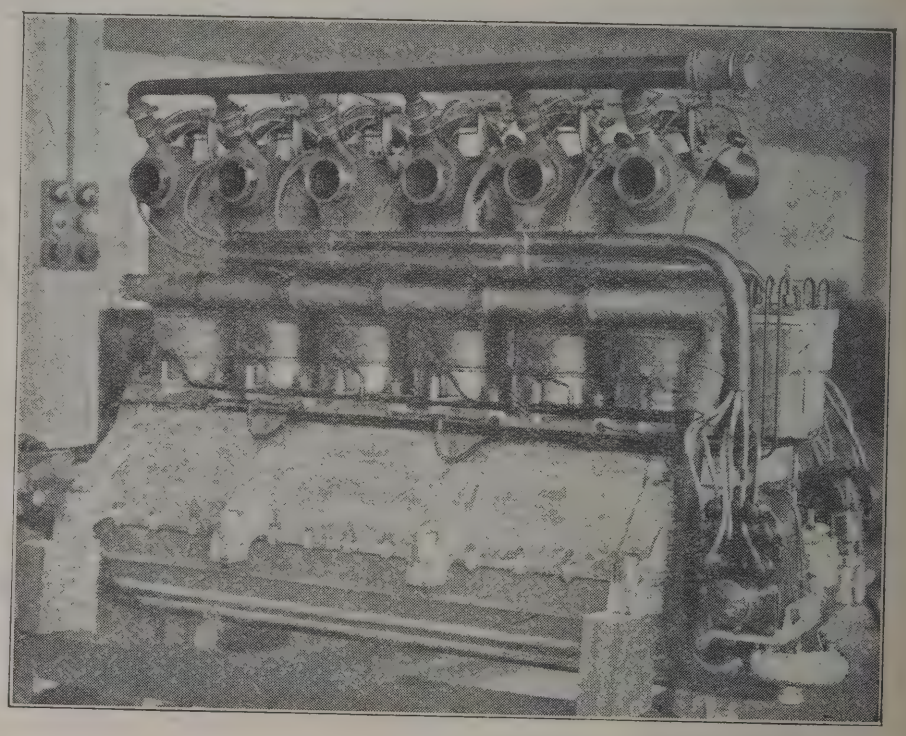
To the rear is bolted the case containing the two scavenger oil pumps, the pressure oil pump, the camshaft drive, and the drive for the magnetos, water and oil pumps.

A twin and a single carburetter on the Napier system are fitted. The gas inlet pipes are of steel and are water-jacketed. Altitude control cocks are fitted and an arrangement is provided to secure equal distribution of the gas to the three cylinder blocks.

Lubrication is by pressure throughout, and an adjustable pressure relief valve and a pressure gauge are incorporated in the system.

The Napier patent air-petrol starter is provided by which explosive mixture is pumped into the cylinders and ignited by a hand-starting magneto operated through the special distributor rotors of the engine magnetos. The starter comprises a hand-operated air pump, petrol vaporiser, air distributing cock, and a simple mechanism for opening the valves on each block of cylinders by hand.

THE BEARDMORE AERO ENGINE, LTD.



The 160-h.p. Beardmore aero engine gained for itself a deservedly great reputation during the war for its extreme reliability, a reputation to which it has distinctly added since Civil Aviation has once more come into being.

It is, therefore, comforting to know that the Beardmore Aero Engine, Ltd., are in a position to offer immediate delivery of this type of engine, which now develops over 200 h.p., and to supply spare parts for it. All such engines are sold with a guarantee which ensures to the purchaser that the manufacturers will continue to take a direct interest in the engine after the sale and at prices and upon terms which will be found extremely attractive by all aircraft manufacturers who need a reliable engine for commercial machines.

The Beardmore 160-h.p. aero engine is of the six-cylinder vertical type, water-cooled, with overhead valves, push-rod operated.

The main dimensions and particulars thereof are :—

Bore, 142 mm.
Stroke, 175 m.
Normal r.p m., 1,280.
Weight complete, dry, 600 lb.

The 160-h.p. Beardmore Aero Engine.

ELECTRICAL EQUIPMENT FOR AIRCRAFT FACTORIES.

G.E.C. Motors Driving Machine Tools in a Manchester Aero-engine Factory

Manchester is a very busy centre of the Aircraft Industry, and the General Electric Co., Ltd., have secured a considerable number of contracts for driving various factories there. One firm in particular has undertakings which include an important motor car factory, considerably extended to accommodate the manufacture of aero-engines, and further, a new aeroplane factory which ranks as one of the largest in this country. The complete equipment for these works has been supplied by the G.E.C. and can be taken as an example of the best practice in electric light and power installations. Incidentally the factories have been laid out for working night and day.

The motor car and aero-engine factories are supplied with three-phase power at 6,600 volts, 50 cycles. This power is brought into a sub-station where the G.E.C. have provided three 500 kw. oil-insulated air-cooled transformers. From the low tension side of the transformers three sets of 420 volt cables pass to the G.E.C. main switchboard through isolating switches which enable the board to be made dead when required. The main switchboard comprises twelve enamelled slate panels of which one controls the incoming power to the board : of the remainder, eight are power and two are lighting distributing panels, whilst there is one spare.

From seven of the power panels mentioned lead-covered and armoured "Pirelli-General" paper-insulated cables run to various G.E.C. staggered type Home Office pattern ironclad distribution boards. Vulcanised rubber cables pass from these boards in heavy gauge screwed and welded G.E.C. conduits to

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

the various motors. From the eighth power panel cables run to a motor-generator. The function of this motor-generator is to supply continuous current to a number of machines from which adjustable speed is required. These machines include several 4 h.p. adjustable speed "Witton" motors, driving gear quietening machines.

Cables are also taken from the main switchboard to four 45 k.v.a and one 20 k.v. a oil-immersed air-cooled transformers for lighting, as well as to motor-generators of two and three kw. capacity which are utilised for charging ignition and starting batteries for the motor cars, and for providing current for magnetic tables, clutches and similar devices.

The motor-generators mentioned provide a solution of the problem feared by some engineers as to how adjustable speed machines should be run from an alternating current supply.

G.E.C. Electro Motor used for testing the Oil Pumps and Lubricating System of Aero-engines.

Parenthetically it may be said that this problem for large machines can readily be solved by utilising alternating current motors of special design, but for very small outputs it is easy to adopt the solution decided upon in these works, and to put in continuous current machines designed for adjustable speed work, and to supply them from a special motor-generator.

For starting the aero-engines on their test benches a 40 h.p. G.E.C. "Witton" motor has been laid down, driving a line shafting to which the engines can be connected.

The "Witton-Kramer" electric drill has been extensively adopted, there being at present about 50 in use.

The whole of the lighting throughout the works is carried out on the direct system, there being over six hundred 18-inch vitreous enamelled G.E.C. "Munition" reflectors for Osram lamps (Atmos type) of various candle powers, which are supported from the roofs by means of light link chains. In the offices the semi-indirect system of lighting has been selected and 18-inch "Equiluxo" bowls are used for this purpose.

PALMER AERO WHEELS.

The exhibit of the Palmer Tyre, Ltd., at Paris will comprise a full range of Palmer aeroplane landing-wheels and tyres from 300 by 60 mm. to 1,750 by 350 mm., and for the first time a new series of broad-tread tyres will be shown in sizes varying from 700 by 100 mm. to 1,500 by 300 mm.

With the development of cross-country flying in Europe the demand for the latter class of cover to meet the conditions at some of the newer flying-grounds is increasing. More interest is now being taken in France and Italy in the proper fairing of aeroplane landing-wheels, and the type of Palmer wheel shield known as the "Full-streamline" is likely to interest Continental designers. It is well known that the Palmer Tyre, Ltd., supplied the landing-wheel equipment of all British fighting and bombing aeroplanes during the whole course of the war, but it is not so generally known that they also equipped a very considerable proportion of the larger French machines.

English visitors will find that, in conformity with the standardisation scheme of the French Military Aviation Service, most of the larger Palmer wheels are fitted with hubs to suit axles of larger diameter than are usually employed with similar dimensioned tyres on British machines. It is a question whether this standardisation is not being carried a little too far in the direction of the smaller dimensions of the big tyre series in that it tends to make the wheel unduly heavy by comparison with those used on this side for similar duty.

Several types of pneumatic tyre landing-wheels as used on seaplane deck trolleys will also be exhibited.

Many people commented on the absence of the well-known Palmer cord laying machine from the recent Paris Automobile Show. This was due to the contractor responsible for the hoisting of the machine into position in the gallery not allowing any factor of safety in the hoisting tackle, with the result that when an attempt was made to swing the machine clear of the gallery at some 30 ft. from the ground the extra strain caused the lashing of the lifting tackle to snap and the machine was reduced to scrap iron. A duplicate machine, however, is being installed at the Grande Palais and will be in operation demonstrating the construction of Palmer cord aeroplane tyres, and will doubtless prove as attractive as ever.

The recent successful conclusion of the London-Australia Flight will give added interest to the exhibit of the Palmer No. 108 (900 by 200) landing-wheel as used by Capt. Ross Smith and also by Capt. Sir John Alcock on the Vickers "Vimy" that accomplished the Atlantic Flight.

AIRSHIPS, LTD.

Upon the stand of the Aircraft Manufacturing Co. at Paris will be found an exhibit by Messrs. Airships, Ltd., which will include the aeroplane flotation gear upon which this company is specialising, and also a model of one of their small non-rigid airships, or "Aerial Yachts."

M-L MAGNETOS.

It has always been the desire of S. Smith and Sons (M.A.), Ltd., to provide the most complete range of motor accessories, and with this end in view, they recently acquired a controlling interest in the M-L Magneto Syndicate, Ltd., of Coventry, and will handle the distribution and sales arrangements for these magnetos at their London office.

During the war, out of a total of approximately a hundred thousand magnetos produced at Coventry fully a half were taken by the Air Services. These magnetos were required to work under the most exacting conditions, and the experience acquired in meeting these condtions has resulted in the production of M-L commercial models, not only lighter and more efficient than the pre-war models, but also capable of operating at higher speeds and running for longer periods without attention.

The range of post-war magnetos consists of the following models: Type K.1 for single-cylinder motor-cycles of 3½-6 h.p., also single-cylinder stationary or marine engines using petrol, paraffin, or gas.

Types K.2 and K.V. for twin-cylinder engines, either horizontally opposed or Vee-twin up to 60 deg. Type K.-S., for slow speed petrol, paraffin, or gas engines. Types G.3, 4, and 6 for 3-, 4-, and 6-cylinder engines. Types 2F.1, 2B.6, and 2F.6 for aeroplane engines, the first being for rotary engines and the last two suitable for either 6-cylinder in line or 12-cylinder Vee type aero engines.

Ninety per cent. of the magnetos used for the rotary engines fitted in the light fighting scouts were of M-L manufacture, these being of the type P.L.R. The 2F.1 is a slightly modified version of this well-known type, being fitted with spigot fixing instead of base-fixing.

THE BRITISH EMAILLITE CO., LTD.

For post-war aircraft the Emaillite Co., Ltd., have three doping schemes available.

Scheme X gives a covering which is durable in all climates, impervious to heat, cold, rain and snow, is water, oil, petrol and fire-proof, and is claimed to be of the very highest efficiency, and yet one of the cheapest methods of treating aeroplane fabric. In this scheme three to four coats of Emaillite are succeeded by either a pigmented oil varnish, a pigmented nitro covering or a transparent oil varnish.

In addition to the doping materials, identification colours in the form of oil varnishes for use over oil varnish protection, or "nitro" colours for use over the nitro protective coverings, are supplied in red, white, blue, and black.

The Emaillite Co. supply also Emaillite Dope remover, varnish remover, and dope and varnish brush washes, and a whole range of varnishes and enamels suitable for all purposes, as well as the whole series of protective varnishes and enamels for aircraft generally, which are covered by the British Engineering Standards Association Specifications X1, X2, X4, X5, X6, X7, X10, and X11.

The all-white Handley Page machine at the Paris Show is entirely doped on the Emaillite Scheme X, and its appearance gives an excellent idea of the finish which can be secured thereby.

THE VICKERS COMMERCIAL TYPE "VIMY" MACHINE.

A Commercial Vickers-Vimy at the E.L.T.A., Amsterdam.

This aeroplane is a modification of the Vickers "Vimy" bomber, which is being supplied in great numbers. It is necessary to mention this in order to emphasise :—

(1) That this aeroplane has been flown under stringent war conditions.

(2) The obvious advantage of an aeroplane that can be used either for war or commercial purposes by the rapid interchangeability of the respective fuselages.

It is of interest to note that the fuselages constitute the sole difference between the "Vimy" bomber, and the "Vimy" commercial, and the "Vimy-Rolls" trans-Atlantic aeroplane.

In dealing, then, with the "Vimy" commercial, those who already know the bomber will have a fair idea of its general appearance.

The fuselage is constructed on the "Monocoque" principle, the "shell" of the cabin being attached to oval wooden rings of box section.

These rings are built up of three-ply, are light, and have immense strength. The cover of the cabin is made under the "Consuta" patent, manufactured by S. E. Saunders, Ltd., of Cowes, who are allied with the Vickers Company.

Consuta is constructed of thin layers of selected wood, with the grain placed diagonally, glued and sewn together with rows of stitching running in parallel lines about 1½ in. apart. The strength of this material is very great, it gives a high factor of safety to the whole construction of the cabin, and entirely dispenses with any cross-bracing wires in any direction. The doors in the fuselage are watertight, and the machine will float in a normal position on water.

Two pilots are carried side by side in the cockpit, placed high up in the "nose," giving a wide range of vision, and dual controls are provided throughout.

All the spars are of box section of spruce and three-ply wood bound with fabric; the interplane struts are of hollow spruce, except in the engine bay, where the struts are of round steel tube, reinforced where necessary and fitted with wooden fairings; the ribs are of spruce. The engine mounts are carried on four struts each side, and the chassis is attached below the engine mountings, thus minimising the load in the anti-lift wires.

The after part of the fuselage is of wood and swaged tie rod construction, the longerons being made under Vickers-Ryan patents.

Throughout the machine, streamline steel tie rods are used in external bracing, and round steel rods in all internal bracing; looped wires and ferrules are not used in any important part.

Two Rolls-Royce "Eagle" Mark VIII are installed, giving a total of 750 h.p. Should one engine fail completely, the machine can fly on the other engine alone at a speed of 70 miles per hour.

The petrol supply is maintained by fan-driven petrol pumps with regulating valves to maintain a constant flow to a service tank with overflow return to main tanks.

Sufficient petrol is carried for a continuous flight of five hours. Should a greater endurance be required, extra tanks can be fitted.

All flying controls are remarkably light in operation, as balanced control surfaces are used where necessary.

In no part has strength and solidity of construction been sacrificed to lightness, a factor of safety of 4½ being provided throughout the machine.

The cabin is totally enclosed, and has a seating capacity for 10 passengers in separate armchairs. A gangway runs down the centre of the car, and there is ample space between the chairs. Cupboards are provided at the end of the cabin

for the storage of light hand luggage. A separate window is placed at the side of each person, and both height and speed indicators are fitted for those who are interested in the new conditions of travelling. Telephonic conversation can be carried on between the pilot and the passengers, and the ventilation and heating can be adjusted as desired to suit any temperature conditions. Noise has been reduced to a minimum, and vibration entirely abolished.

The seats in the cabin can be detached in a few minutes, giving a floor area of 53 sq. ft., and a volumetric capacity of 300 cub. ft. for freight, which can be kept at an even temperature and dry. The maximum weight which can be carried is 2,500 lb.

When mail-carrying, sorting-boxes are fitted, and the process of sorting can be carried out on similar lines to the arrangements now in operation on the mail trains.

The following table gives the plain particulars of the machine :—

SPECIFICATION.

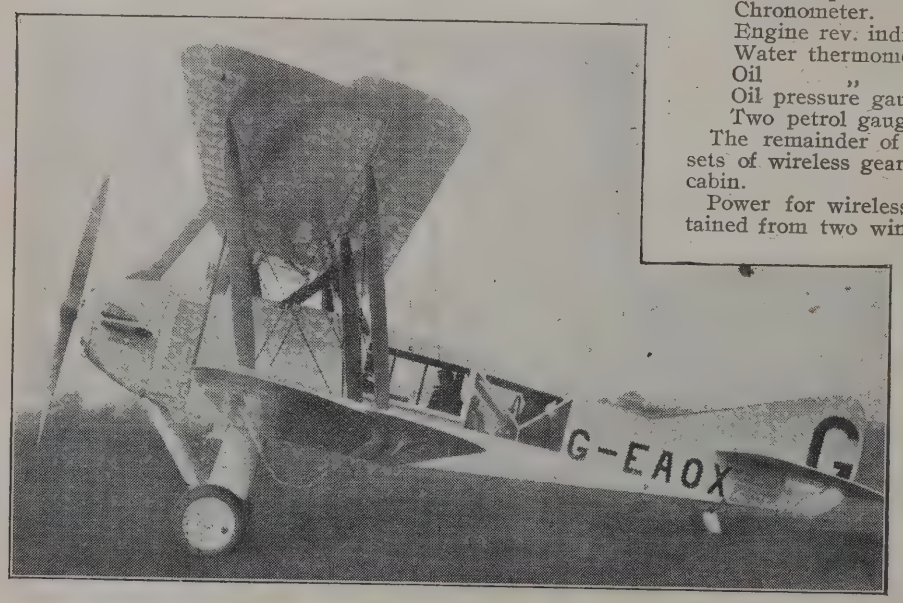
Type of machine	Twin-engined tractor biplane.
Name or type No. of machine	Vickers "Vimy."
Purpose for which intended	Commercial.
Span	67 ft.
Gap, maximum and minimum	10 ft.
Overall length	42 ft. 8 in.
Maximum height	15 ft. 3 in.
Chord	10 ft. 6 in.
Total surface of wings	1,330 sq. ft.
Span of tail	16 ft.
Engine type and h.p.	Two 375 h.p. "Eagle" Rolls-Royce.
Weight of machine empty	7,292 lb.
Load per sq. ft.	8.4 lb.
Weight per h.p.	16.4 lb.
Tank capacity in hours	5 hr.
PERFORMANCE—	
Speed low down	110 m.p.h.
Speed at 6,000 ft.	103 m.p.h.
Speed at 10,000 ft.	99 m.p.h.
Landing speed	45 m.p.h.
Climb—	
To 6,000 ft. in minutes	17 min.
To 10,000 ft. in minutes	48 min.
Disposable load	2,308 lb.
Total weight of machine loaded	11,120 lb.

THE ALLIANCE AEROPLANE CO.

The following descriptive matter has been received from the Alliance Aeroplane Co., Ltd. :—

The Alliance Aeroplane Co., Ltd., of which Sir S. J. Waring is chairman, was formed by Messrs. Waring and Gillow, Ltd., early in the war to carry out their Government aircraft contracts and is, therefore, one of the group of aircraft and aircraft engine firms controlled by Sir Samuel Waring.

In addition to converting their Hammersmith factory into a well-equipped aeroplane works, Messrs. Waring and Gillow acquired the well-known School of Flying Instruction and the large private aerodrome at Acton from Messrs. Ruffy, Arnell, and Baumann Aviation Co., where many hundreds of Service pilots were trained during the war, including such famous men as Capt. Ball, V.C., D.S.O., M.C., etc.



At Acton Aerodrome the final erection and flying tests of the war machines were carried out. Huge hangars were put in hand at Acton, each bay being of the size of 220 ft. by 160 ft., the doors giving a clear opening 160 ft. wide by 40 ft. high. These hangars are now almost completed, and the fact that the firm intends to make use of them as hangars may be taken as some clue to their future policy.

Soon after the Armistice, the Government announcement that no further aircraft contracts would be issued led the firm, in order that their great experience gained under the stress of war-time production might not be wasted, to turn their attention to civil aviation.

To this end the Alliance Aeroplane Company engaged the services of Mr. J. A. Peters, consulting engineer to Messrs. Ruffy, Arnell, and Baumann, and designer of their latest type of fuselage tractor biplane for advanced instruction.

Mr. Peters has been engaged on technical work in connection with aircraft since 1909, and was engaged with several well-known pre-war firms as senior or chief draughtsman on their designing staffs.

The first machine produced was designed for the "owner-driver" for cross-country flying or for use as an aerodrome hack. It can be landed in and taken off from a very small field; it lands at a very low speed and pulls up in 25 yards, while it can get away in 70 yards. The simplicity of its detail renders it cheap to produce and to keep in repair, while its robust construction allows the machine to be stunted and badly landed without any need for constant trueing up. A point of value to owners, particularly those in the Colonies, is that the whole structure consists of ordinary commercial timber, mild steel sheet, cables and hard steel wire, thereby keeping the necessary stock of special materials down to an absolute minimum.

An Alliance Biplane, Napier Engine.

The fuel cost is extremely low (about 3½d. per mile) owing to the installation of an 80 h.p. Renault engine.

The second machine designed by Mr. Peters was the one he intended to pilot in the attempt to fly the Atlantic.

This machine is a biplane fitted with a single 450 h.p. Napier engine, 500 gallons of petrol and 50 gallons of oil giving a range of over 3,000 miles non-stop.

The portion of the fuselage between the wings is entirely filled by the 500 gallon petrol tank.

The crew are stationed in an entirely enclosed cabin, directly aft of the main tank, which, when the windows are closed, cuts out almost all of the engine roar.

The whole of the front end of the cabin is taken up by the dashboard, which has been described by a member of a well-known instrument firm as the most complete he has ever seen. The attached photograph gives some idea of the many instruments fitted, of which the following is a list :—

Air speed indicator.
Air density gauge, for correcting above for height and temperature.
Altitude indicator.
Inclinometer.
Recording air speed indicator, marking the air speed, corrected for height and temperature, on a chart.
Two compasses.
Chronometer.
Engine rev. indicator.
Water thermometer.
Oil " "
Oil pressure gauges.
Two petrol gauges.

The remainder of the dashboard is covered with the four sets of wireless gear, which overflow round the sides of the cabin.

Power for wireless, lighting, and battery charging is obtained from two wind-driven generators, one giving 12 volts and the other 1,200 volts. The machine controls consist of a wheel for the pilot, which can be thrown out of gear and tipped forward out of the way during his "watch below," a detachable "stick" for the navigator, and a rudder bar each.

Other contents of the cabin include the pilot's personal kit, fire extinguisher, charts and a chart board for the navigator, and last, but not least, the rations. Sandwiches, acid drops, chewing gum, and chocolate are carried in a locker for the period of flying, while four quart thermos flasks of coffee stand in a rack. For such a flight as the Atlantic, emergency rations were also provided.

MILLS CASTINGS

ALUMINIUM

We undertake full responsibility for the accuracy and quality of our castings from the time our Pattern Shops receive the drawings until you receive the castings. We have our own Laboratory and Physical Testing Plant. All alloys are made under the control of a Head Chemist. Analyses and tests are taken daily, thus ensuring regularity and uniformity in our castings.

We have the latest equipment in Moulding Machines for any size casting, and can quote very favourably for repetition work. We invite your enquiries.

CAST IRON

Motor Cylinders, Water and Air Cooled.

WM. MILLS LTD.
Aluminium and Iron Founders,
Atlas Works, Grove Street,
BIRMINGHAM.

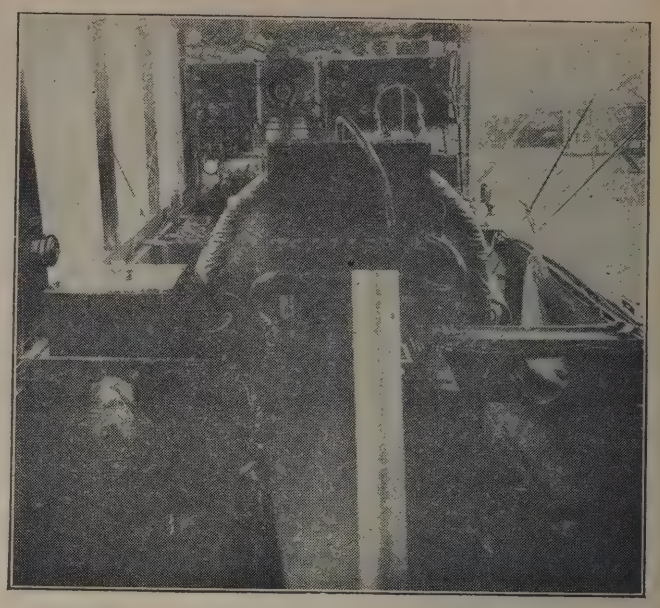
No effort has been spared to provide for all possible contingencies. In the event of any failure of machine or engine necessitating a forced landing, the navigator's first care, if the machine is heavily loaded, is, while the pilot is selecting his landing ground, to empty or partially empty the petrol tank through the large jettison cock. This greatly assists landing on bad ground, and in the case of a forced descent into the sea the empty tank will provide sufficient buoyancy to support the whole machine. Additional flotation is provided by air bags in the rear of the fuselage and by the main planes, which are made air-tight, without the usual eyelets, and are all coupled up to the same air vent cock as the air bags. This, of course, is to prevent the planes from bursting at height due to the variation in density, the cock being only closed when "ditching" is imminent.

A kite is stowed on the top of the fuselage which, by lifting the wireless aerial, enables communication to be established when on the ground or floating on the sea.

The machine has a top speed of 135 m.p.h., a range of 3,000 miles non-stop, a landing speed of under 50 m.p.h., and pulls up in 80 yards on an average aerodrome.

On July 31st Messrs. Peters and Curtis flew this machine to Madrid to inaugurate an inter-communication service between the various houses of Messrs. Waring and Gillow, Ltd. This flight was the first and is so far the only non-stop flight between London and Madrid, being a record flight of approximately 900 miles in 7¾ hours.

The second machine was almost identical with the first and was intended for the Australian flight.



Lieut. Douglas, M.C., D.C.M., A.F.C., flew the second machine for about fifteen hours and was very emphatic in his statement that it was the finest machine he had ever flown.

Unfortunately, this machine was crashed shortly after starting on the Australian flight and Lieuts. Douglas and Ross were killed.

A modified type of this machine is now in course of construction, with a cabin fitted up to accommodate eight passengers or to carry about a ton of goods or mails. This machine has an oleo undercarriage with a very wide track.

The next machine to be designed was a five-seater biplane fitted with a 200-h.p. Hispano engine and fuel for a flight of 800 miles. The passengers are accommodated in an enclosed cabin between the wings with the pilot immediately behind them in the normal position. The wings are designed to fold so that the machine can be garaged in a small shed and an oleo undercarriage is provided, having a very wide track. With full load this machine has a top speed of 117 m.p.h. and a landing speed of 45 m.p.h. The fuel cost is 4¾d. per mile.

A twin-engine machine is at present being detailed, but it is not proposed to describe this at the moment.

View from the pilot's seat of the Alliance Biplane.

LUKE TURNER AND CO.

An interesting item of the lecture given by Mr. J. D. North on undercarriages at the Royal Aeronautical Society's meeting was a description of an improved type of rubber shock-absorber.

The Luke Turner patent endless shock absorber ring undoubtedly possesses considerable advantages over the shock absorber cord to specification F.16 which was the sole material available to designers during the war.

This ring is constructed in a similar manner to the original cord, but is formed of only one single thread of rubber wound into a coil of the required thickness and diameter, when the beginning and end of the thread are secured by one knot.

The material is then braided with two or more coverings of cotton by a patented process which provides a ring capable of carrying extremely high loads.

Mr. Turner, of Luke Turner and Co., Leicester, the patentees and manufacturers, states that such a ring of ⅞-in. cord section can be supplied which will carry a load of 3,000 lb. at 75 per cent. extension.

He also claims that besides their ease of fitting (which is obvious) and the economy of replacing a single ring instead of a complete length of cord should it become damaged, they offer a decided saving in weight and cost over any other form of shock absorber.

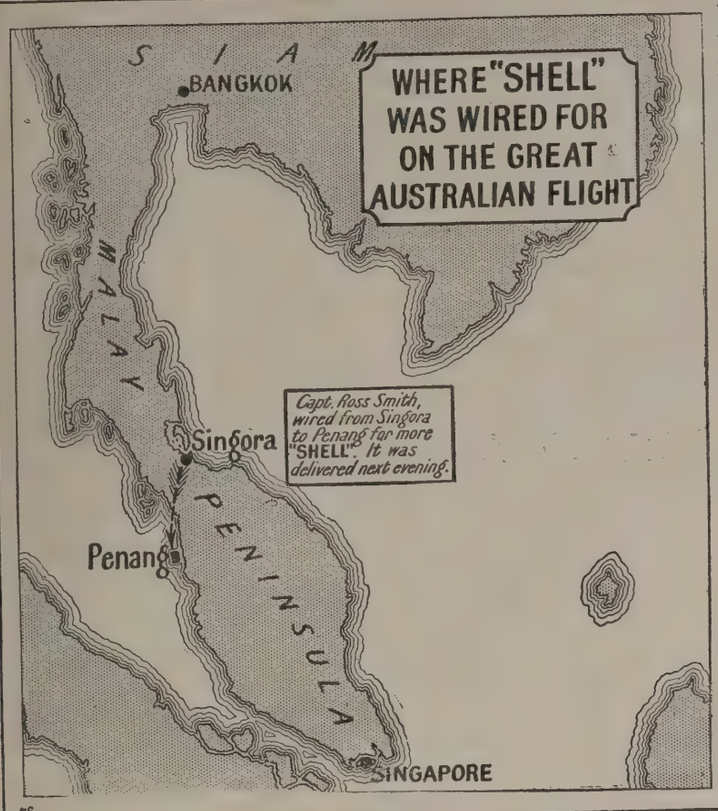
Designers who have felt that some improvement is required upon the somewhat slip-shod and unmechanical war-time method of springing undercarriages with elastic cord would be well advised to get into touch with the manufacturers and inquire into the possibilities of this new patent shock absorber ring, which is already in use upon several of the best known types of machine.

LODGE AERO PLUGS.

As the result of the unique experience gained during the war in the design and construction of the sparking plug for practically every type of aero-engine, the Lodge Sparking Plug Co., Ltd., of Rugby, are concentrating on the production of three post-war aero plugs. Extreme care is taken with the manufacture of these plugs, and, coupled with the stringent tests that are applied during construction, practically guarantees them to stand up to the severe conditions appertaining to aircraft engines. The three types are :—

Type K.R.3 for aero engines, with stationary cylinders, more particularly of the air-cooled type. This pattern has also been used very successfully on racing air-cooled motor-cycle engines. Type D.13 for aero engines, with stationary cylinders of the water-cooled type. Type R.F. for aero engines of the rotary type. The plug is as light as possible, consistent with electrical and mechanical strength, and the peculiar type of spark gap has been found to give the best results against the effect of centrifugal force, and the flooding of lubricating oil that is liable to occur.

HENRY HUGHES AND SON, LTD.



The manufacture of aeronautical instruments, like the whole industry pertaining to aviation, has entered a new phase with the re-establishment of peace conditions. During the war it necessarily received a huge impetus, demonstrating beyond question the absolute supremacy of British productions.

When the need for instruments for aviation first arose it was only natural that the manufacture of such essentially accurate and reliable accessories should receive attention from firms already engaged on similar mathematically correct articles. Famous for generations in the "service of the world's navigators," Henry Hughes and Son, Ltd., of 59, Fenchurch Street, and Ilford, have devoted much study to the new science of aeronautical instruments. Their productions in this class of work soon became an important part of their business, and with the outbreak of war, few houses were able so rapidly to respond to the country's urgent need.

An official letter from the War Office ran : "You may congratulate yourselves on the present splendid output of aeroplane compasses, without which, I am afraid, our position would be very desperate, as no other firm has managed to rise to the occasion to anything like the same extent." Further recognition of the service of his firm was the order of "Officer of the British Empire" conferred on Mr. A. J. Hughes.

Undoubtedly, the secret of the firm's great output is the system adopted by which mass production is secured on lines of standardised machine-made goods. Standardisation brought Germany much of the world's pre-war trade—standardisation is now bringing back the trade to this country. Britain has ever held paramount position for work of supreme reliability, and the modern methods of production as instituted in the works of Messrs. Hughes, will maintain and increase her commercial prestige.

One of the best known is the "Husun" type 253 Aero Compass, designed for long-distance flights. It is a specimen of work that tells more than any words how this firm is re-asserting British supremacy. The splendid finish, no less than the extreme accuracy of this compass is typical of the wide range of instruments bearing the well-known mark of "Husun."

76

MOST THRILLING PAGES in Capt. Ross Smith's Diary of the Great Australian Flight

DECEMBER 2.—"Left Bangkok 7.0 and arrived at Singora at 1 . . . met heavy monsoon; . . . Almost blinded with rain but country impossible for landing . . . Worst flying conditions ever encountered . . . The Aerodrome at Singora is bad and stumpy. Had to land in a cross wind on a small dry patch. Safely down with luck. Later taxi-ing the machine, tail-skid caught root and broke fitting; not serious . . . Decided that, owing to weather we could not reach Singapore without more petrol. Wired Asiatic Petroleum Company,* Penang, to send urgently. During night heavy squalls, crew held machine all night . . .

DECEMBER 3.—Torrential rain with wind. Repaired skid, crew wet through, working on machine all day cheerfully. Petrol arrived evening; raining too hard to put in."

THOS. FIRTH AND SONS, LTD., SHEFFIELD.

The well-known firm of Sheffield steel makers, Thos. Firth and Sons, Ltd., has been especially closely associated with the aircraft industry since its very early days. They were the first specialists in high-grade steels to foresee the immense future of aircraft, and with characteristic enterprise set to work to anticipate the demand which they felt assured would soon arise for steels to be used in their manufacture.

While aeroplanes were still in a highly experimental stage, Thos. Firth and Sons, Ltd., after considerable research and experiment, produced a range of steels in sheet and bar form specially adapted for aircraft construction. It thus happened that when the war broke out and an unexpected demand for aircraft suddenly arose, there were already available excellent and standardised steels for the purpose. It is undoubtedly due to the pioneer work of this firm that the production of aircraft in large quantities was greatly facilitated.

An important item in the wartime output of Thos. Firth and Sons was stainless steel, a material the future prospects of which are very great. Although the most interesting property of this steel is its resistance to rust, its value for the purposes of aircraft has been due to another peculiarity, that of resisting the action of heat and of retaining a high tensile strength at high temperatures. These virtues made it of particular value for valves, and very large quantities of stainless steel valves were used in aero engines in the war.

Now that unrestricted development of this steel can proceed, its appearance may be shortly expected in many applications where its properties of resisting rust and corrosion, freedom from scaling at high temperatures, and high tensile strength render it almost indispensable.

In addition to stainless steel, Thos. Firth and Sons are manufacturing a standardised range of carbon and alloy steels, designed to comply with a higher standard than that imposed by the specifications of the Air Ministry and Engineering Standards Committee. Among these steels will be found a suitable quality for every purpose involved in the manufacture of aircraft and their engines.

Apart from their more standardised lines of manufacture, the firm intends to continue its policy of progress, and its research laboratory is equipped for the investigation of problems concerned with the development of steels with which to keep pace with the advancing requirements of aircraft industry.

In addition to the manufacture of constructional steels for the aircraft, automobile and allied trades, Thos. Firth and Sons are well known as specialists in high-speed and other tool steels, and in drills and other engineers' tools. The post-war demand for the various grades of their Speedicut high-speed steel is very great, and a large part of their modern factory at Tinsley is devoted to its production.

Their engineers' small tool plant has been largely increased in size to cope with the growing market for its products, and its output is being so organised that a representative stock is constantly held of a very wide range of all the high-speed drills, reamers, and milling cutters likely to be required for urgent delivery.

RUBERY, OWEN AND CO.

Rubery, Owen and Co., of Darlaston, Staffordshire, have catered for the needs of British aircraft manufacturers in such matters as pressed steel work and in the manufacture of turnbuckles, eyebolts, bolts and nuts, etc., from the beginning.

Their work has always been excellent, and, during the period of hostilities, their output must have been enormous.

They are still open to undertake any work of this class, and they have in hand a stock of various sizes of bolts and nuts and turnbuckles from which they can give immediate delivery.

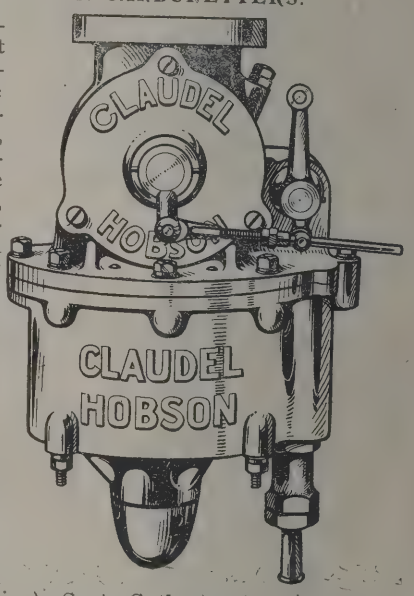
"K.L.G." SPARKING PLUGS.

The "K.L.G." plug owes its inception to Mr. Kenelm Lee-Guinness, who discovered that there was not a plug in the world that would stand up to the work of racing-car engines just prior to the war. Exhaustive and protracted tests resulted in the development of a plug that was considered to be up to the standard for racing-car engines of the time. These plugs were fitted to the Sunbeam car driven by Mr. K. Lee-Guinness in the 1914 International T.T. race.

At the time these plugs were not produced commercially, but on the outbreak of war the demand for plugs of this nature led the Air Board to urge Mr. Lee-Guinness to extend his personal work to meet national needs.

From this time until the present day K.L.G. plugs have been produced in ever-increasing quantities and it is sufficient to show the high opinion that the authorities held of these plugs, that, in spite of the continuous expansion of the factory, it was never able to satisfy the demands of the Air Ministry, although they were being produced at the rate of two million plugs per year.

The unique experience gained during the war is now being concentrated on the post-war editions of this famous spark producer. It is interesting to note that K.L.G. plugs were used on all the British machines entered for the Atlantic flight, on the Sunbeam engines of the R.34, on the double Atlantic crossing, on all the competitors entered for the Aerial Derby, on the Napier engine of the Alliance "Seabird" that flew from London to Madrid non-stop, etc., etc.



WAKEFIELD'S CASTROL.

Messrs. C. C. Wakefield and Co., Ltd., of Wakefield House, Cheapside, London, E.C., who have recently opened an office in Paris at 21 Rue du Mont Thabor, are known all over the world as the manufacturers of "Castrol R," the aero-engine lubricant, which has been foremost ever since the beginning of aviation. Its unique properties have established for it a reputation of the highest class, and the best tribute to its value is the fact that Castrol R. was selected by every competitor for the flight across the Atlantic, and also by all those who started on the recent historic journey to Australia.

Practically every flying record of every kind in Great Britain since 1909 has been accomplished with the aid of this lubricant. It has earned countless testimonials, prominent among them being one received from the Air Council—which we believe to be the first testimonial ever given to any firm for publication by this Council—regarding its performance on the Sunbeam motors "R.34."

The principal features of this oil are its absence of carbon deposit, its remarkable resistance to extreme cold, and its high viscosity at high temperatures. During the greatest flight of all, that by Captain Ross-Smith, from London to Australia, the oil met with every kind of climatic condition, but carried the Vickers-Vimy Rolls-Royce motors through triumphantly.

CLAUDEL-HOBSON CARBURETTERS.

It is sufficiently well-known to what extent Claudel-Hobson carburetters were used in the Air Services of the Allies during the war, and taking into consideration the esteem they then won, it is only natural, perhaps, to hear that in practically all the big things done in this country since the Armistice, such as the first direct flight across the Atlantic by Capt. Sir John Alcock on the Vickers-"Vimy"-Rolls, the England-America-England flight of H.M.A. "R.34" (Sunbeam Coatalen engines), the London-Madrid non-stop flight of the Alliance "Seabird" (Napier Aero engine), Capt. Gathergood's little bunch of speed records from 5-400 kilometres on the Airco D.H.9R. (Napier Aero engine), the England to Australia flight of Capt. Ross Smith on the Vickers "Vimy-Rolls," etc., have all been done with the aid of the Claudel-Hobson carburetter.

ACCLES AND POLLOCK, LTD.

During the war many firms whose productive plant was capable of producing aircraft parts of any kind were kept fully occupied in turning out large quantities of parts and fittings to standard specification. With the conclusion of the war, and the public clamour for economy, huge contracts for aircraft were cancelled, with the result that any amount of material in all stages of manufacture were left on the hands of the manufacturer for him to dispose as he thought fit and profitable. Accles and Pollock, Ltd., the well-known makers and workers of weldless steel tube, were engaged in making aircraft fittings during the war, but, with the signing of the Armistice, the lack of demand, corresponding with the cancellation of contracts, has caused them to concentrate solely on the manufacture and manipulation of steel tubing, and, as such, offer their assistance to the Aircraft manufacturers in general. Fortunately, their factory is fully occupied on the production of tubing for all manner of work, but it is not too fully occupied for them to deal with anything that may be required by the Aircraft Industry.

Accles and Pollock, Ltd., at present, have on hand a surplus stock of fittings and parts to the value of about £6,000, and only the lack of spare labour prevents them from clearing it out of the shops and passing it into the melting-pot. They point out that should any of their tools or any of this surplus stock of parts be of any use to any aircraft firm, they would be most willing to meet them.

EXPRESS TRAVEL BY AIR

The remarkable reliability of the Airco machines which are running the Daily Air Service between London and Paris is shown by the following summary of flights and mileages :—

1. THE NEW AIRCO 16.

45 Flights were made during the first twelve weeks, with a total approximate mileage of 11,400 miles.

2. AIRCO 9B

37 Flights have been accomplished by this machine, covering an approximate total of 9,250 miles.

3. AIRCO 4A.

This well-known machine has successfully made no fewer than 95 flights between London and Paris during the first 12 weeks, covering a total distance of approximately 23,750 miles.

HOW TO PRACTISE PARACHUTING.

By Lt.-Col. H. S. Holt, C.B.E.

(All rights reserved.)

A TRAINING MACHINE.

Since the writer's last article appeared it has been officially stated in the Press that the authorities have definitely decided to make life-saving parachutes an integral part of the equipment of their Service machines. The carrying out of this decision not only entails a large expenditure, but greatly affects the safety of aviators in the future. It becomes, then, of great interest to know what general principles are guiding the Technical Committee in their selection of the type of parachute to be adopted.

Some months ago a curious article appeared in the Technical Press. Published anonymously, the writer happens to know that it actually emanated from official quarters. Purporting to be advice to parachute inventors as to what direction their activities should take and as to what was or was not likely to be acceptable to the Parachute Committee, it opens with this remarkable dictum :—

"The principal object in equipping aircraft with parachutes is to inspire confidence in those who use aircraft."

Some simple-minded persons, like the present writer, have hitherto been under the impression that the principal object of a life-saving parachute was to save life and that its value was proportionate to its ability to do this under any conceivable conditions. Apparently it doesn't matter what the parachute is or does if only the authorities can camouflage it to an appearance of safety and reliability. If this article really represents the considered opinion of the Parachute Committee, it will hardly tend to "inspire confidence" in the judgment of that body.

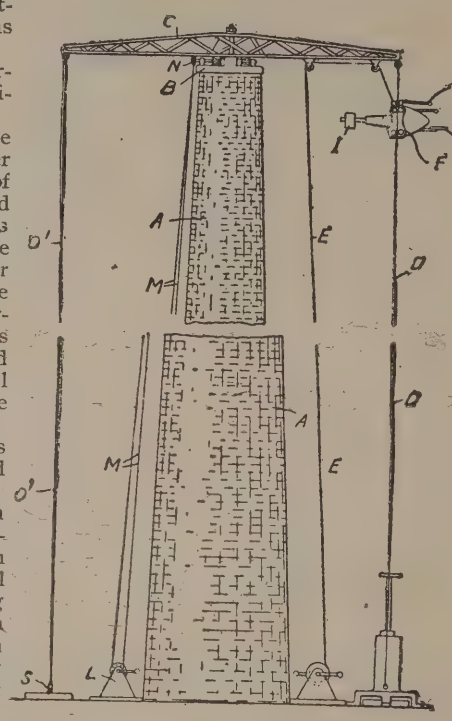
Once upon a time a lofty factory was erected with two wings. Each was equipped with a different type of fire escape.

No. 1 was a regular iron staircase with balustrade and all. Everyone was delighted with the iron staircase, and when the company ordained a weekly fire-drill the employees voted it good fun running down the staircase. No. 2 was merely a seemingly rickety iron ladder which swayed and shook in the wind, and only one or two venturesome spirits would trust themselves on it.

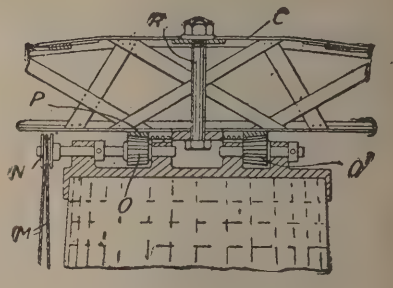
Then one day the factory caught fire. The iron staircase proved too heavy; the heat quickly loosened the cement fixings, and when the employees crowded onto it the whole crashed to the ground In the other wing there was only the iron ladder, and the employees had to choose between this and being burnt alive. No one bothered their heads then as to whether it shook or swayed, they clambered down it and all escaped.

Just so there are two general types of life-saving parachutes :—

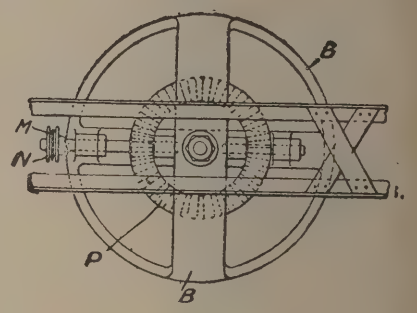
No. 1 type is apparently simple and certain in action when used from aircraft flying normally and under complete control and doubtless inspires confidence in those who make descents for pleasure or practice or advertisement, but which, in the opinion of some of us, will merely prove a broken reed in the hour of need.



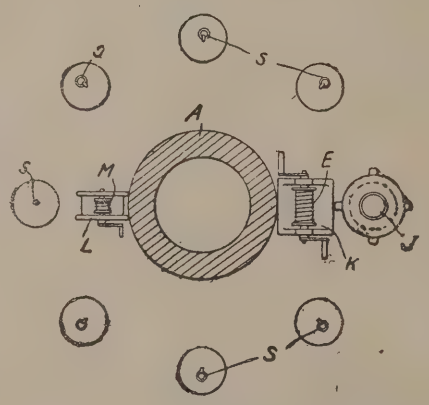
No. 2 type may seem less positive and certain in action, and parachutists would very likely feel less confidence in using it for practice descents. But if No. 1 would prove useless in the majority of peace-time accidents, while No. 2 would afford at least a sporting chance of escape in almost any conceivable circumstances, it seems obvious that No. 2 type should be given exhaustive trials instead of being condemned off-hand, merely because it does not "inspire confidence."



The writer is very far from wishing to minimise the importance of the passengers feeling confidence in their parachutes, but surely the right way to obtain this confidence is by making practice descents. A Service airman undergoes a severe training in everything affecting his duties with the single exception of parachuting. Then when disaster comes to his machine, he is expected to make his escape by parachute necessarily hurriedly and possibly under difficult conditions without previous training and experience.



It may be objected that parachute practice involves risk and it is for this reason that the writer ventures to describe a machine he has devised for practising parachute descents with little, if any, more risk than attends the use of an ordinary lift.



Any derelict factory chimney of sufficient height, such, for instance, as the destructor chimney at Aldershot, could be easily and inexpensively adapted for the purpose.

The machine consists essentially of a carriage travelling freely on a vertical or nearly vertical cable. In the first instance the writer proposed to employ a balloon to support the upper end of the cable, the lower end being secured to the ground, but though this would have been a cheap and simple way of carrying out his purpose, the writer came to the conclusion that there were too many practical obstacles to its successful working. In its present simplest form the cable may be

attached by means of brackets to any sufficiently lofty building. But for obvious reasons a tall factory chimney is the most suitable and convenient erection for the purpose.

The diagrammatic drawing appended shows the general arrangement. The main cable "D" is secured at one end to one of the rings "S" set into cement, thence it travels over pulleys attached to the arm "C" and descends again to another of the rings "S." Means are provided for straining this cable. The arm "C" is a light lattice steel frame, pivoted at its centre and capable of being rotated in a horizontal plane by means of the cord "M" passing over the pulley "N."

The object of this rotating arm and series of rings "S" is to allow of the position of the main cable "D" being varied according to the direction of the wind at the time. A light bamboo carriage "F" is mounted to run freely on the cable "D." It is fitted with a long arm carrying an adjustable counter weight "I" to balance the weight of the passenger. The passenger stands on the platform "A," an arm being provided for him to hold on to. The carriage "F" is hoisted by means of the elevating cable "E" and the windlass "K." The latter is fitted with a brake so that the descent of the

Beardmore

AeroEngines

carriage can be checked or stopped instantaneously; and as an additional precaution a screw or lever brake "H" is attached to the carriage which may further be fitted with an automatic check brake which comes into action only when the carriage is nearing the ground. A pneumatic buffer "J" may also be employed, but the need for it is doubtful.

The *modus operandi* is as follows:—The arm must first be rotated into such a position that the main cable is on the lee side of the chimney, and the two ends of the cable are then made fast to opposite rings "S.S."

If one of the ordinary single parachute systems such as the Spencer or Calthrop is to be used, the passenger will take this with him on the carriage. He will then be hoisted up to the top of the main cable, in which position he can attach the parachute receptacle to the arm "C." The parachute cord will be attached to his harness in the ordinary way. As soon as all is ready he signals to the operator at the windlass who takes off the brake allowing the carriage to fall. As the passenger falls with the carriage the parachute is withdrawn from its case, and the cable being on the lee side the parachute is blown away from the chimney. As soon as the parachute is sufficiently inflated, but not before, it lifts the passenger from the carriage. Should the parachute fail to inflate, the operator at the windlass will check the fall of the carriage, or it may be checked by the automatic check brake, so that passenger and carriage reach the ground at a safe speed.

When a passenger is having his first lesson, it will be well on the first two or three trials to reduce the rate of fall of the carriage to such a slow speed that the parachute does not open or not enough to lift the passenger off the carriage.

If one of the parachute systems is used in which the parachute is carried on the passenger's back, the *modus operandi* will be essentially the same; the cord for withdrawing the parachute being attached to the rotating arm. If the Autochute or any similar compound system is being used, the passenger will hold the pilot parachute in his hand and release it the instant the carriage begins to fall.

When the passenger has made a few descents and acquired confidence in his parachute, he need not wait to be pulled off the carriage, but he can jump off as soon as he sees the parachute commencing to inflate.

Anyone practising occasionally on this machine must acquire a coolness and confidence in his parachute which may stand him in good stead when the hour of need comes. If this appliance was used for testing parachutes with dummies, it would mean a great saving of time compared with the usual method of employing kite balloons or aeroplanes as well as saving of petrol or hydrogen.

Given the necessary chimney, such, for instance, as the old destructor chimney at Aldershot already referred to, the actual apparatus need not cost more than £200 or £300.

When will the Air Council, and more especially the Civil Aviation Department, come down from the clouds and realise basic facts?

So far their propaganda activities mostly take the form of glowing accounts describing official aircraft trips. But the man-in-the-street, even the problematic "business-man-in-a hurry" who was to fly from London to Manchester for ten minutes' business talk, remains cold.

It is, of course, pleasing and gratifying to read of luxurious trips (at the public expense) made by distinguished officers with printing presses and brass bedsteads, chefs and hot dinners as accessories in the picture, but the civilian of ordinary intelligence knows that one spark from a boot-heel might send the whole bag of tricks crashing to earth, bedsteads and all.

This form of propaganda must be very costly, and the same amount of money spent on subsidising the P.O. to initiate one or two express letter and parcel services from London to the North of England would do much more to impress the business man. Meanwhile, for want of other work, aircraft manufacturers are turning out boot-jacks and milking-stools and such like. But when the shortage in these articles, due to the war, is made up the trade will naturally revert to pre-war makers.

Then the trouble will come. Pioneers always suffer, as witness the fate of early electrical engineering, safety bicycle, tyre and motor-car companies. But it will be as nothing to the casualties that will await aerial enterprises. Let us look facts in the face. Airships and aeroplanes are now made as safe and reliable as they are likely to be for some time, unless some epoch-making invention appears. Still the public remains cold. Why? Because aviation is too uncertain, too risky and too costly: but first and all the time *too risky*.

"Accidents will happen"—and do happen every month. What is the remedy? The great Atlantic liners, immeasurably safer than any aircraft, carry lifeboats for all. Similarly, every airship or plane should carry lifeboats for all the occupants. The only aerial lifeboat known up to now is the parachute. But it is not enough merely to make parachutes compulsory and to inform the passengers that they are carried. The public, or at any rate the potential flying public, must have facilities for seeing them in actual use and for trying and practising with them themselves. This means public demonstration grounds and some device to enable practice descents to be made without any risk. The writer has thought it worth while to describe his own device; but there will no doubt be better ones forthcoming soon.

Once convince the civilian that he has a really reliable means of escape even in case of the worst accident to his machine, and you will go far towards making him regard aviation in a new light.

GNOME AND LE RHONE ENGINES.

The Gnôme and the Le Rhône engines at the Paris Show, naturally enough, will be under the ægis of the Société des Moteurs Gnôme et Rhône.

It should be noted that the sole licensees for these engines in Britain and the British Colonies are Peter Hooker, Ltd., Walthamstow, who are associated with the Gnôme and Le Rhône Engine Co., of 27, Buckingham Gate, London, S.W.

A BUSINESS OPPORTUNITY.

The proprietors of a successful wholesale motor accessories business in London announce that it is for sale, and suggest that it would be a good investment for a little private syndicate of demobilised officers.

This business was employed in manufacturing aeroplane sundries during the War, and at the end of last year when the demand more or less ceased, the factory was closed and new premises were opened in the West End to supply motor accessories.

The business has been running about a year and the turnover has reached about £2,000 a month. There are 800 customers on the books, and the business employs six travellers and agents, besides a manager and four or five clerks at the offices and warehouse.

As the owners were not formerly interested in this class of trade, and wish to return to their own business, they are open to sell the one in question. They are gradually reducing their stock, and are not making further purchases, and stock at present stands roughly at £1,200. It can be bought or not, as desired, at valuation.

The premises, which comprise three offices and a basement warehouse, are held on a three-years' lease at a rental of £250 per annum. About £250 has been spent in structural alterations and fittings, and the owners are open to dispose of the lease to anyone interested for this figure. They are asking about £300 for goodwill, and as they have established the nucleus of a sound business, and have already a large number of customers on the books, they think this appears to be a very favourable opportunity for anyone to acquire the business on good terms.

NEW COMPANIES.

Lodge Plugs, Ltd.—Private company. Registered Nov. 22nd. Capital, £300,000 in £1 shares. To take over the business of manufacturers of and dealers in sparking plugs and electric appliances and apparatus carried on at Rugby by the Lodge Sparking Plug Co., Ltd. (now in liquidation), and to enter into an agreement with the said old company, and F. B. Lodge, the liquidator thereof. The subscribers (each with one share) are:—B. Hopps, St. Peters Road, Rugby (engineer); A. M. Lodge, St. Peters Road, Rugby (engineer).

The first directors are to be divided into Group "A," representing the holders of shares numbered 1 to 125,000, Group "B," representing holders of shares 125,001 to 250,000. The "A" and "B" directors may appoint one other director to be classed as "C." The first directors are: J. A. Hopps and B. Hopps (Group "A") and F. B. Lodge and A. M. Lodge (Group "B"). There are certain restrictions on transfers of shares which "shall remain in operation during the lifetime of any of the lineal descendants of His late Majesty King Edward VII living at the date of registration of the Company and for 21 years after the death of the last survivor of such descendants but not subsequent thereto. Solicitors: Pinsent and Co., Birmingham.

IF "THE AEROPLANE" WERE RUN BY THE AIR MINISTRY.

BY "THE SNIPE."

The Editor of THE AEROPLANE clicked smartly to attention and saluted the Director-General of Technical Aeronautical Publications, who had commandeered the Guildhall in order to form a new branch of the Air Ministry which had been manned in order that peace might be waged efficiently.

The Editor seemed ill at ease; the D.G.T.A.P. looked grim. Above his throne Gog and Magog looked down. They were clothed in barathea cloth of different shades, for another change in R.A.F. uniform was under consideration and it had been found convenient to use them as dummies for the inspection of the vast committee that would shortly throng the historic hall.

Gog looked rakish in a steel helmet fringed with gold lace; Magog appeared less warlike in a Tam-o'-Shanter adorned with the R.A.F. badge and osprey plumes.

The D.G.T.A.P. selected with great care a cigar from a lordly case, desired a Staff Captain to present his compliments to the Adjutant and to ask him to be so kind as to give instructions to the Orderly Officer to order the Orderly Serjeant to detail an Airman to bring the Ministerial cigar-cutter, and then turned to the Editor.

"You are aware," he said, "that in accordance with the absolute power conferred upon us by the amended Defence of the Realm Act for the Prosecution of Peace this great department has been formed. Now that we are no longer distracted by war, and have practically succeeded in destroying the aircraft industry, work in which we have been ably assisted by Parliament, we propose to assume entire control over the technical Press, and we have no doubt that our efforts will be as successful as they have been in guiding a great industry to its present state of happy stagnation."

He paused as an Airman, in an experimental uniform of blue and khaki tartan, saluted and placed before him the Ministerial cigar-cutter.

Having cut and lighted his cigar, he continued:

"I have sent for you to-day because I am informed that the technical publication known as THE AEROPLANE is at present not being conducted upon the recognised lines laid down for transacting business in great Government Departments. For example, I am informed that, though you have up to the present been allowed to continue to hold the position of Commanding Editor, you perform menial tasks, such as the writing of what I believe you call leading articles, and such subordinate duties. Your staff is undisciplined and undrilled. Working hours are devoted entirely to the production of the publication instead of being apportioned to healthy physical training, manly and womanly sports, such as lawn tennis, to warm the blood when summer sets in with its usual severity, and less violent pastimes for the temperate days of winter. It is with regret that I have been driven to the conclusion that you have shown no capacity to command. Your unit has caused no passionate comments either in Parliament or in the Press which is as yet uncontrolled. Unless something spectacular is done the public will not know how its money is being spent."

He relit his cigar, which had ceased to glow during the speech, and made a fresh start.

"The allied unit which undertakes the printing of the publication is in the same state of undisciplined devotion to its work. It merely prints as it did before the Peace, whereas it should by this time have produced posters in colour that would show the public the reasons for raising the next National Loan.

"I have already drafted a few catch-phrases for posters which will show what we are doing, and will attract the kind of recruits we require when we raise the establishments of the units. Here are a few rough notes. The pictorial work will, of course, be carried out by the new Poster Ministry which is being formed."

The D.G.T.A.P. displayed large sheets of fine vellum upon which had been scrawled:

"YOU'LL ONLY PLAY AND NEVER WORK,
SO JOIN UP AND BE PAID TO SHIRK."
"SPLENDID FUN! JAZZ DANCES!! PRETTY WRAFS!!!
TICKLE-TOE AT THE EXPENSE OF YOUR COUNTRY."
"CAN YOU PLAY THE BANJO?
YOU CAN BANJE IN THE R.A.F.
QUICK PROMOTION FOR JAZZ MUSICIANS."

"Rather neat, I think," said the D.G.T.A.P. complacently. "No damn silliness about your King and Country needing you. Just a human appeal to the type of person we want.

"But to resume," he said, raising his eyes from the sheets of vellum and frowning at the Commanding Editor, "it is obvious that you have shown no capacity to carry on your duties. With regard to your present staff, are they competent to perform the menial tasks of producing the publication?"

"The most highly trained and efficient staff obtainable," said the Editor loyally.

"Good. That leaves my hands entirely free. I can appoint to the higher commands officials who are not hampered by technical knowledge, and who can consequently devote their energies to disciplinary and administrative duties. You will return to your unit and carry on until such time as the higher appointments have been made. You may go."

"I prefer to resign, Sir," said the Editor.

"Resign in the face of the fiercest peace in history! It cannot be allowed. You may go."

The Editor saluted. He felt that his thoughts might be more forcibly expressed when he had left the Presence.

. . . . . .

The next few weeks were like a feverish dream. A Marshal of THE AEROPLANE was appointed with a Staff of senior officers whose names required a special issue of the "London Gazette." All the other tenants in 175, Piccadilly were evicted and Burlington House opposite was requisitioned.

The entire country was rainbow-hued with recruiting posters, and each day the recruits were drilled in the courtyard of the Royal Academy. A portion of Hyde Park had been railed off, and thousands of carpenters were erecting huts for the newly enlisted Airmen (who were distinguished by the new badge showing a pen and ink-eraser crossed) and hostels for the W.W.R.A.F. (Women Writers, Royal Air Force).

At the printing works in Chancery Lane similar activities were taking place. All the buildings between Rolls Passage and the Record Office had been taken over and were being redecorated.

"The time is now ripe," said the officer in charge of the Civil Transport Department, T.A.P.T.D.17, which occupied the entire upper floor of Burlington House. "We must blaze the trail from Piccadilly to Chancery Lane."

"How do you blaze a trail?" asked the second in command.

"Oh, you just make blazes along it, don't you know. What?" replied his chief.

"We've already burnt all the new machines we have in stock," said his junior regretfully. "Shall I ring up Supplies to order some more?"

"Please. And say it's urgent. In the meantime we will begin blazing with mechanical transport."

"It's all sold," said the second in command.

"Nonsense! Borrow a few thousands of Sappers or Miners, I forget which kind dig. Probably the Miners are on strike, anyhow, so you had better indent for Sappers. Set them to work to excavate in any of the abandoned M.T. Parks, and if they go deep enough into the mud they will find plenty of lorries for the purpose. The mining rights in these Parks are to be put up for auction shortly, so we are only just in time. See to it."

"It shall be done, Sir. We'll make a blaze in England that will never be put out."

For weeks the peace was waged relentlessly by thousands inspired by the Will to Win promotion. The first lorry to be disinterred was discovered just above the old red sandstone stratum, and was towed to Burlington House by a tank. So great was the energy displayed that it was found that within a month, during which a new chassis, engine, and body had been fitted, it would run under its own power. The O.i/C of T.A.P.T.D.17 had it loaded with petrol, the Marshal of THE AEROPLANE took his seat beside the driver, distinguished representatives of the Admiralty and War Office sat on the petrol tins behind, and, after waiting for the Press photographers to do their work, started amidst ringing cheers on the great pioneer enterprise of blazing the trail to Chancery Lane.

The deathless story of that journey is written in letters of fire in the annals of the Force. It will be remembered that the old petrol tank, the only part of the lorry to be retained, had been found in a leaky condition. The leak had been stopped with chewing-gum by an ingenious mechanic, but the gum is supposed to have become hard and brittle, possibly due to having been insufficiently masticated. Whatever the cause, we know that it fell off in Piccadilly Circus and that a broad stream of best aviation spirit gushed into the road.

We know that the lorry proceeded to Leicester Square without the distinguished pioneers being aware of the mishap, as they thought the shouts of the vulgar mob were plaudits and were busy saluting to right and left.

The collision in Leicester Square with a W.D. lorry that was conveying anti-aircraft ammunition to a secret dump precipitated matters. It will be remembered that both

lorries caught fire and that the explosion of the ammunition burst open the petrol tins, so that rivers of flame poured down the streets and into the basements of the adjacent houses. For days the West End of London was a raging furnace, and when at last the fire was quelled, by the old process of blowing up threatened buildings before the flames could reach them, it was found that a broad tract of devastated territory lay between the H.Q. in Piccadilly and Charing Cross, so that the first part of the route to Chancery Lane had been cleared and the trains of lorries that would shortly carry "copy" to the printers could pass on their way unimpeded.

All this is public knowledge, but the Editor of THE AEROPLANE saw behind the scenes.

"It's magnificent, but it is not Peace," the Marshal, who was one of the few survivors, had said. "However, we must steel our hearts. The trail must be blazed. Next time we will begin at Charing Cross. But I would like one of our latest bombers to be in that offensive. The M.T. section have got all the decorations out of this one."

Historic words that will be remembered while the Ministry lasts.

But while these events were taking place other departments were not idle. A permanent Committee composed of many hundreds of high officials, with power to call cubist artists, theatrical costumiers, and other experts, had been sitting for weeks to decide upon the next uniform cover for THE AEROPLANE.

It was this Committee that finally obtained powers to take over the editorial offices in which the Editor and Sub-Editors of THE AEROPLANE were still allowed to toil. There came a cold November day when they found themselves homeless. Sentries guarded the door of the building from which they had been evicted by the Committee. Their papers, files, their priceless records of aviation had been destroyed.

. . . . . .

At nightfall, when cold November rain was falling and dim lamps were throwing long reflections on the roadway of deserted Piccadilly, the Editor of THE AEROPLANE sat on the cold kerb in front of what had once been his office. Broken hearted, he could not restrain the not unmanly tears that dimmed his sight so that he had to remove his monocle. The eye-glass slipped from his unnerved hand and was shattered on the pavement. It was the last straw. With a groan he rose and hurled himself prone in front of an approaching three-ton lorry. He felt the front near wheel of the lumbering vehicle touch him. . . .

. . . . . .

He woke to find a Royal Aero Club waiter shaking his shoulder gently. All the other members had gone home and most of the lights had been turned out.

"But it would be worse than that, really," he said, as he made his way towards the hall.

INTELLIGENCE IN THE R.A.F.

During the war, in a certain very exclusive and recherché part of the Thames Valley there existed an R.A.F. training centre for the purpose of instructing all manner of people, from almost every walk of life, in all that there was worth knowing in the administrative and technical branches of the Air Force. This super Clark's College, in the short period of two months, turned out numbers of people who, as the result of an examination, were deemed qualified by the high authorities at the Hotel Bolo (née Cecil) to assume the responsibilities of Sec. Lieuts. (Ad.) and Sec. Lieuts. (T.).

Among each course, perhaps 40 per cent. were Service men, the majority of whom were N.C.O's in the R.F.C. and R.A.F., men who, having served in the ranks of the R.F.C. and worked their way up to N.C.O's on sheer merit, were eminently suited to hold commissioned rank in the R.A.F.

The remainder of the Service element was composed of crocked infantrymen and other medical misfits who were adjudged by a stringent selection board as being qualified to take a commission in the R.A.F. as Sec. Lieuts. (A. or T.) by their pre-war experience and knowledge, at the same time being sufficiently old or war-worn to be of no further use for active service.

All these men took the course in the rank held at the time of being summoned to report at the school, feeding in their respective mess-rooms and drawing their ordinaty pay. They were housed in empty billets and were not allowed fires except under the M.O.'s orders, no lights after 10 p.m. and very few facilities for working in the evening. There was half an hour's drill before breakfast and no forms of organised exercise for all to take part, the football, cricket, or rowing teams consisting principally of the instructors and some of the privileged officers.

The remainder of the course consisted of a few officers transferred from the Army owing to unfitness, a few crashed pilots and a large number of civilians, many of unknown origin and quite unfitted by their social and educational standard to hold His Majesty's commission. These people were gazetted as Sec. Lieuts. on entering the school and therefore entitled to the privileges of the officers' mess, with its numerous customs and comforts, though many of them were not sufficiently well born to appreciate them.

The high standard of intelligence shown by some verged on the extraordinary, of which the following is a fair sample. During the course of a lecture by a long-suffering and underpaid N.C.O. instructor, the class was being told of the various causes of tail and nose-heaviness. The instructor gave all causes and remedies, at the same time mentioning that some machines, owing to the extreme heaviness of the engine, etc., had lead placed in the tail end of the fuselage to counteract this. He also recalled that sometimes it had been discovered that careless mechanics had been known to leave spanners and other articles in the fuselage during an overhaul.

He then asked a particularly bright member of the class to define tail-heaviness and suggest a remedy. The cause was duly given with much prompting, together with the following remedy:—"Strip the fuselage to ascertain if any careless mechanics have left any lumps of lead, spanners, or other heavy articles in the fuselage." This "officer" passed the final exam.!

Perhaps the unkindest cut of all in connection with this school was the fact that a man who was previously in the ranks was not gazetted until he passed the final exam., whereas a civilian was gazetted on joining the school. Therefore, on passing out, the civilian always had two months' seniority over the mere soldier.

Again, should an N.C.O. or a "ranker" fail twice he was returned to his unit as useless for commissioned rank in the R.A.F., and therefore blighted of any further chances of applying for a commission anywhere, whereas if the civilian "officer" failed he was sent to Blandford as an officer in the R.A.F. either for draft conducting purposes or for disposal to fill up any new "hot-air departments" formed at Bolo, or elsewhere. Now one knows how the R.A.F. maintained its supply of trousers polishers during the war.

As for the peace-time R.A.F. it is comforting to know that such a state of affairs cannot exist when once the Force begins to feel its feet, although it is a well-known fact at the present time that in the wild orgy of demobilisation large numbers of the right stamp of man are being placed on the unemployed list, whereas a fair number of these "unwinged" officers are being retained owing to the fact that they are so firmly rooted in the mire that they themselves have carefully prepared.—L. L. B.

TO ALL THOSE WHO HAVE NOT YET SPENT THEIR GRATUITIES.

He was such a nice man.

He had features like a good-natured Mephistopheles, and he spoke American. He drank cocktails most graciously, and it was a pleasure to give him lunch. He seemed to cast an atmosphere of mysterious prosperity over the club lounge.

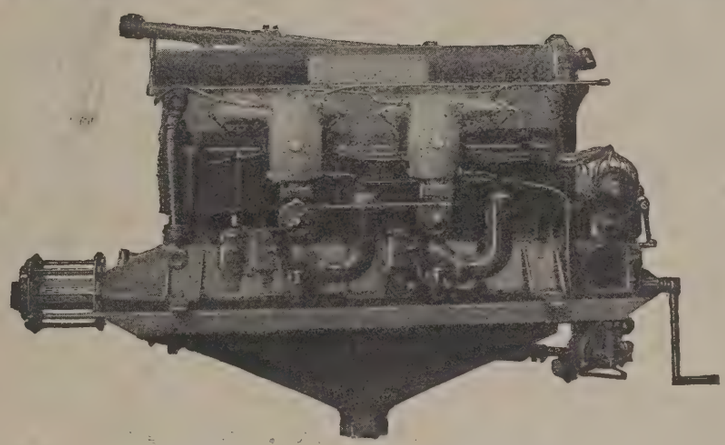
Then he got going.

He said that, of course, it was only because he was speaking to a friend, and a friend whom he could trust, that he mentioned his great scheme. It was a glorious scheme, both ennobling and advantageous. He proposed to feed the starving population of Europe from great stores of food he had accumulated in America; and he needed really smart Continental managers to make a success of it.

The trivial part of the whole matter was, that he required only £100 from each prospective manager as a guarantee of good faith.

He waved a bunch of papers in his right hand, and produced a gold cigarette-case with his left. He said that anyone could go through the papers, but he put them away and offered a Gold Flake.

It was very good of him to take the cheque for £100. Somehow, one felt it was more than good of him; it was positively splendid. He said he was leaving for the Continent to arrange matters.



He is still there, but the American Continent is rather a large place in which to find him.

Oh! you gratuity-splashers, if you meet anyone like that, hit him with a hatchet, quick.

This appeal is issued by the Society for the Protection of Young Airmen. The Society consists of one. I've been bitten already.

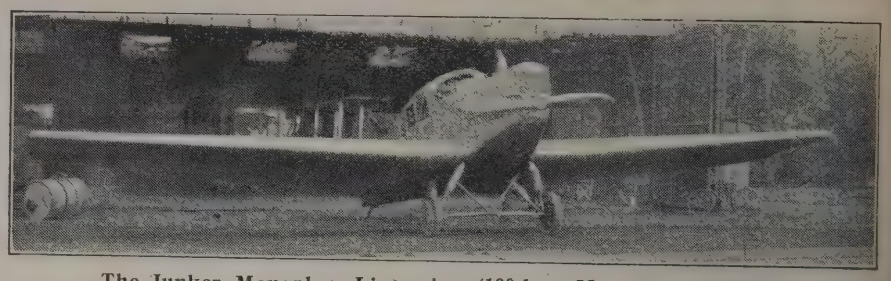
SUNBEAM-COATALEN AIRCRAFT ENGINES

SUNBEAM - COATALEN "DYAK"
100 H.P. AERO ENGINE.



This engine is on exhibition at the Paris Aero Show

STAND NO. 48
GRAND NEF

THE SUNBEAM MOTOR CAR CO., Ltd.
MOORFIELD WORKS, WOLVERHAMPTON.

A GERMAN AEROPLANE IN LITHUANIA.

The Lithuanian military authorities have lately come into possession of a remarkable German aeroplane, in quite exceptional circumstances. This machine is a monoplane which, owing to darkness and bad weather, landed at Abeli, close to the Bolshevik front line near Dvinsk, on October 15th, while en route from Berlin to Moscow, with its pilot, a mechanic and three passengers, viz., a Russian and two Turks. The monoplane was seized by the Lithuanians and flown to Kovno by its pilot under Lithuanian escort.

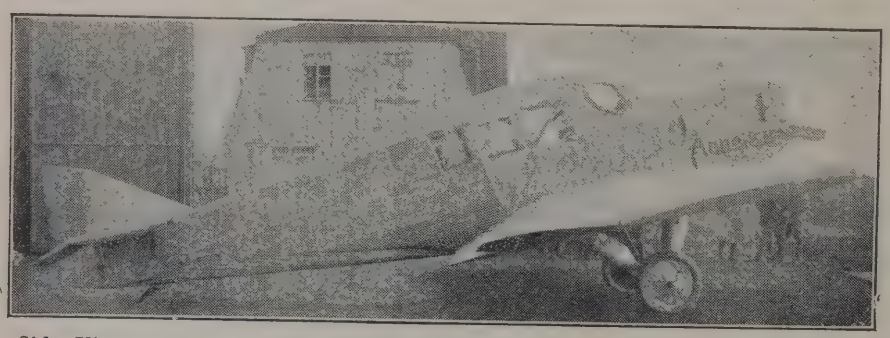
The Junker Monoplane-Limousine (160-h.p. Mercédès engine).

The monoplane represents something quite new in the technique of aviation. It is an all-metal eight-seater machine, fitted with a 160 h.p. Mercédès engine. The metal consists of thin corrugated duralumin plates, or some similar composition. The weight of the monoplane is 1,015 kilogrammes; its useful load is 625 kilogrammes, to which can be added an extra load of 130 kilogrammes, making a total weight of 1,770 kilogrammes. The builders are the Junkers Flugzeugwerke A.G., of Dessau, who have already produced a second model of the kind. The internal construction of fuselage and wings is on a system of aluminium tubes and girders, which gives extraordinary stiffness, combined with remarkable lightness.

The pilot, a demobilised Oberleutnant, Hans Hesse, told me that this construction is similar to that of the new Junkers all-metal war machine. He also stated that the present monoplane had recently created a world's record for altitude, with eight passengers, of 7,000 metres, but he said that the climb was slow. He further described the machine as not very easy to fly, and as having a high landing speed. The cabin, the position of which is clearly shown in the accompanying photographs, is most comfortably fitted for six passengers, very much after the style of a luxurious motor-car. The wings are remarkably thick, and, being hollow, are used for carrying two spare propellers, the petrol tank, a spare set of wheels, and other parts.

The front view of the monoplane is shown in one of the accompanying photographs.

Apart from the technical interest attaching to the aeroplane itself, the circumstances surrounding its capture, and the events leading up to the same are little less than sensational. Readers of THE AEROPLANE may, therefore, feel curious to know a little more about them. The three passengers comprise one Abraham Frankl, a Russian Jew, an engineer in the employ of the Junkers firm, who states that he was being taken on the trip as interpreter; Dr. Dmitri Nicola, alias Sayd Emin, a Christian Turk, and Mohammed Ali Sami, a Turkish subject. The two latter described themselves as in the service of the Turkish Red Cross. They purported to be on their way to Russia in order to enter into negotiations with the Soviet Government for the return of Turkish prisoners of war. Nicola also said that the German Government had verbally asked him to try to make arrangements for the return of some German hostages in exchange for the notorious Radek. Nicola had 80,000 roubles with him, ostensibly as expenses for the pilot and mechanic during the trip, the purchase of petrol, etc.



According to the pilot, Hesse, he was simply commissioned by his firm to fly this aeroplane to Moscow in order to make inquiries as to the possibility of selling the patent and establishing a factory in Russia for the manufacture of machines of this type. For the rest, he disclaimed all knowledge of the purpose for which his passengers were travelling to Soviet Land.

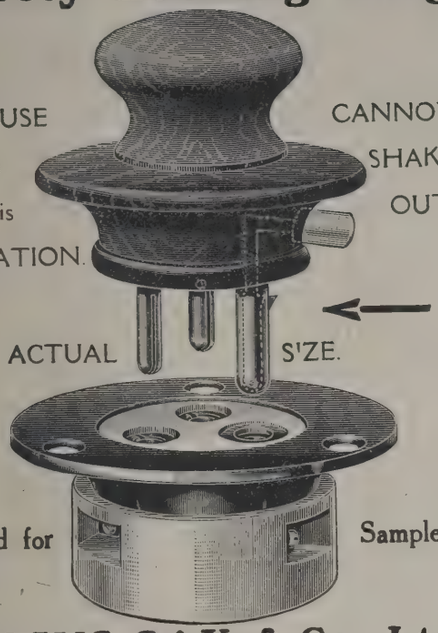
The itinerary of the monoplane was briefly as follows: On Oct. 2nd the Berlin Ministry of War arranged for the aeroplane to fly to von der Goltz with an important letter. The aeroplane, however, was not quite ready then, and by the 8th the German Government had changed its plans. Instead of flying to Mitau, the monoplane left Berlin on Oct. 10th bound for Moscow, with its passengers, as already described. It reached Konigsberg on the 13th, having made two forced landings en route owing to minor defects. It left Konigsberg on the 15th and landed at Shavli, a place in Lithuania in Russo-German occupation, between noon and 3 p.m. Here the pilot and his companions were cordially received by both German and Russian officers, and were treated to a good meal. When the Russian officers heard the monoplane's destination they confided numerous letters to the pilot for ultimate delivery in Moscow and Petrograd.

It is significant that although the Russo-Germans profess to be out for a fight to the death with the Bolsheviks, they took no steps whatever to prevent Hesse from completing his journey. From this fact it is naturally inferred that Hesse also carried papers of considerable importance to the Russo-German troops, though, of course, Hesse remains silent on this head. Soon after 3 p.m. the monoplane again took the air, proceeding in the direction of Russia, but at 4 p.m. on the 15th, it landed at Abeli, where, together with its occupants, it was taken in charge by the Lithuanian military authorities. The pilot and mechanic, with their Lithuanian escort, flew to Kovno, but the three passengers were brought here by train.

The facts of the case were immediately reported to the British Military and Political Missions, which, in their turn, telegraphed to their Home Governments for instructions regarding disposal of the machine and its occupants, who, in the interim, were detained.

Since then, however, there has been an astounding sequel to the foregoing, in the shape of the escape of the two Turks by aerial route, but not in the same machine. The leading rôle in this romantic episode was played by a young, well-known German aviator, named Rotter, hitherto in the employ of the Lithuanian aviation corps. Early in the afternoon on the day of the escape, Rotter went up to the aerodrome, and suggested to one of his pupils that they should go for a flip over to one of the forts, take a few photographs and return. One of the regular L.V.G. biplanes was requisitioned for the purpose. On landing near the fort, the aeroplane was approached by two respectably dressed civilians, under escort of an armed Lithuanian private. No sooner had the pupil alighted than Rotter produced two Mausers, one of which he deftly tossed down to the civilians, whose identity needs no amplification, while, with the other, he threatened the pupil with an unpleasant death if he made the slightest attempt to interfere. One of the Turks similarly covered the guard, who appeared to be paralysed with terror, for he stood supine while the two Turks clambered into the aeroplane. Under threat of death the pupil was compelled to restart the propeller, and Rotter, with his passengers, flew merrily away, either back to Germany, or in the direction of Shavli—his objective has not yet been ascertained. The unfortunate pupil had to walk all the way back to the aerodrome, in a state bordering upon nervous breakdown.

Side View of the Junker-Limousine (160-h.p. Mercédès engine), which flew from Berlin to Shavli, Lithuania.



It remains to be discovered by what means Rotter managed to communicate with the two Turks, and why they were allowed to wander so far afield in the charge of a solitary soldier. That such methods should be resorted to in order to effect their removal from Lithuanian custody bears out the surmise that they were persons of consideration charged with a mission of no small importance to the Soviet Republic. In lieu of the escaped Turks the Lithuanian Government gets a brand new German monoplane which, in the circumstances, is clearly forfeit.

AVIATION DEVELOPMENTS IN AUSTRALIA.

The Australian Press have made much of the fact that eight flying squadrons returned to Australia without a single aeroplane. The only machines in the country appear to be a few D.H.6 and Maurice Farman Shorthorns, and yet there can be few places with better flying prospects than that particular "God's own country."

A reason was given that there are no hangars in Australia and that it was no use taking the machines out there only to rot in the open all day and all night. France is dotted with Bessonaux, unused and rotting, their use given to any farmers who require them. It is said not to be worth the expense of bringing them to England, where there is no sale for them. It would be worth while shipping them to Australia before they collapse, torn to shreds by the weather.

Already there are five registered Australian aviation companies: Aerial Transport, Ltd., Aerial Company, Ltd., Aerial Services, Ltd., the Australian Aircraft and Engineering Co., and the Larkin-Sopwith Aviation Co., Ltd. There are also several smaller firms composed of collections of ex-Air Force or Aus. F. Corps pilots. These concerns mostly have one or two D.H.6 machines and are simply out to give short flights with passengers.

Aerial Transport, Ltd.

A company under the above name was formed and registered in the spring of this year by Major Lee Murray (ex-R.A.F.) and Mr. H. Sleeman. The ambitious programme of this company, which includes the linking up of all the large cities in Australia by aerial services, was given in the issue of The Aeroplane dated Sept. 24th.

Major Murray completed a survey of the Melbourne-Adelaide route on July 22nd by motor-car. Five landing-sites were selected. On July 29th he started on a survey of the Melbourne-Sydney route.

Sydney was reached on Aug. 10th, and an official welcome was given by the New South Wales Section of the Australian Aero Club. The return journey to Melbourne was started on Aug. 19th, and the survey was completed on Aug. 23rd.

Aerial Company, Ltd.

This company was registered at Sydney on April 16th of this year. It has adopted the shorter title of A.C.L. and is capitalised at £20,000 in £1 shares. Some of the objects of the company as detailed in its prospectus are:—

(1) To give pleasure, commercial, advertising and exhibition flights; (2) to establish an instructional school in aviation to be conducted on lines similar to the military aviation school at Hendon; (3) to establish branches in country centres.

The whole of the capital has been subscribed privately. The managing director is Lieut.-Col. Percy Woods, D.S.O., M.C., and the chairman of the directors is Mr. H. C. Macfie, F.C.P.A., F.C.I.S.

Two D.H.6 machines were bought from the Central Flying School, Point Cook, Victoria, after the auction sale. These machines were piloted by Capt. P. G. Taylor, M.C., R.A.F., and Flight-Lieut. R. F. Oakes, A.F.C., from the Central Flying School to Sydney. The actual flying time of one of the machines was only 9¾ hours, but they started on March 31st and did not reach Victoria Park, Sydney, until April 8th.

The reasons for the length of time taken on the flight were that those D.H.6 machines had only petrol capacity for two hours, and that they carried a totally inadequate tool kit, with no spare parts of any description. Great difficulty was encountered at times in gaining sufficient height to cross the ranges of mountains; adverse winds were encountered, and in one part of the trip the machines only travelled a distance of four miles in 25 minutes. The engines also gave trouble and had to be overhauled and repaired several times on the journey.

On Aug. 6th a flight was made on one of the D.H.6 machines from Richmond to Bathurst. The pilot was Lieut. C. V. Ryrie, who was accompanied by Lieut. N. P. H. Neal, M.C., M.M. The pilot considers a flight across the mountains very difficult and should not be attempted at a height less than 10,000 ft.

Mr. H. C. Macfie, the chairman of the Aerial Company, Ltd., sailed for England late in August. He is at present in England and buying machines to take back with him to Australia.

Aerial Services, Ltd.

The object of this company is to create aerial services between London and Sydney. A survey party left Sydney on Sept. 31st last on motor-cycles and crossed the Continent of Australia from south to north. No real hardships were suffered, as the arrangements for the trip had been very well made.

Addresses were given at most of the centres en route where the pathfinders were entertained. The occupants of the various towns visited were greatly impressed by the thought that they would have an aerial service which would bring them nearer to civilisation.

A series of land relay and fuel stations have been mapped out at suitable distances, and contracts have been completed and partly completed for ten of these stations. Four stations are in Queensland and six in the northern territory.

The survey is being continued across the Malay Archipelago. The company is to confine itself to long-distance flying.

The Australian Aircraft and Engineering Co.

The Australian agency for the products of A. V. Roe and Co., Ltd., has been acquired by Lieut. Nigel B. Love, A.F.C., R.A.F., of the Sydney firm of John Bridge and Co. His associates in the company are Lieut. W. J. Warneford and Mr. H. E. Broadsmith, F.R.Ae.S., who was the chief engineer and designer to A. V. Roe and Co., Ltd.

Mr. Broadsmith took over to Australia a fleet of Avro biplanes and a number of Avro seaplanes fitted with Bentley rotary engines, destined for Melbourne and Sydney.

Registration for the title of the Australian Aircraft and Engineering Co. was applied for early in July, and by that name the company will probably be known. Lieut. Warneford was expected to reach Sydney in September in charge of the first shipment from England. Four demonstration machines were to arrive, in addition to twenty two-seaters, mostly of the standard Avro K504 type. Erecting workshops were to be established in Sydney, where the machines were to be reassembled.

Lieut. Love has stated that the object of the company is to establish aviation on a commercial basis in Australia, and that the programme would include short passenger flights. Operations were due to start in October and were to be confined to New South Wales, Victoria, and Tasmania. It was proposed to lay out aerodromes at Sydney and Melbourne and probably a third at Hobart.

The Larkin-Sopwith Aviation Co., Ltd.

Capt. Herbert J. Larkin, D.F.C. (ex-R.A.F.), the general manager of the above-named Australasian company, reached Melbourne from Great Britain by steamship on July 25th. The object of the company is to assist aerial transport companies in the formation and maintenance of their passenger services. All spares and accessories for aviation will be stocked. They are producing a light portable hangar which can be carried in a single-seater machine.

Several Sopwith machines have been or are to be shipped to Australia, including a "Dove," a "Gnu," a "Transport," and an instructional machine. The headquarters of the company are at Melbourne. A London office has been opened at No. 4, St. Mary Axe, E.C.

Smaller Aviation Concerns.

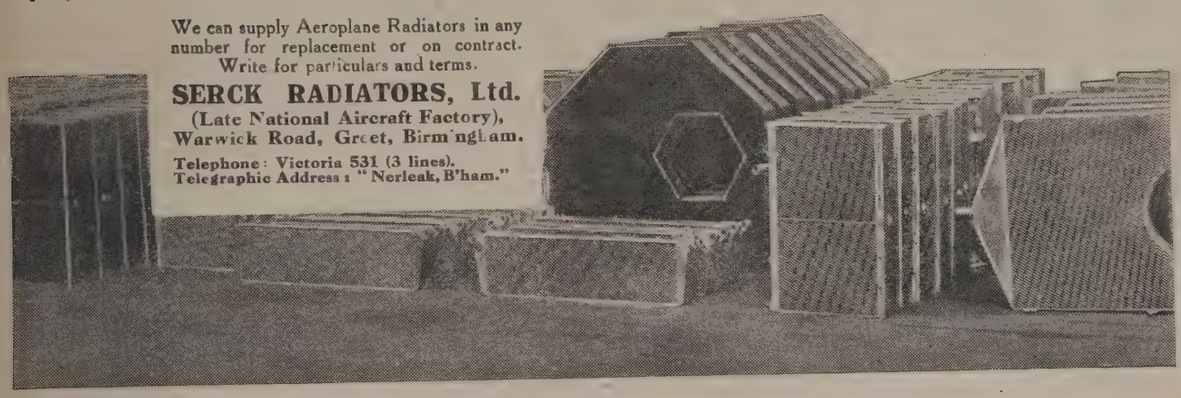
Two of the D.H.6 aeroplanes offered for sale at the Central School of Flying were purchased jointly by three returned officers of the Australian Flying Corps—Capt. E. J. Jones, M.C., D.F.C., Capt. R. W. McKenzie, M.C., and Capt. S. G. Brearley, D.F.C. The machines were overhauled at the flying school and were to be flown to Hamilton, Victoria, the headquarters of the owners. They were to be used for short passenger and advertising flights over the western district.

A commercial flight from Melbourne to Bendigo was made on July 18th in one of the six 80-h.p Maurice Farman Shorthorns recently bought at the Central Flying School by the Carey-Fenton Syndicate. Mr. Grahame Carey piloted the machine and carried as passenger the foreign sales representative of the Dodge Automobile Co., Ltd. The return journey of 202 miles was completed in 187 minutes.

Another D.H.6 was purchased from the same source by Lieut. H. Treloar, A.F.C. This machine will be similarly employed over the territory north of the Victoria railway line between Serviceton and Arrarat. Lieut. Treloar's headquarters will be at Bendigo. Arrangements have been made with the Jones-McKenzie partnership whereby the "territory" will be equally divided between the two concerns. Lieut. Treloar has been piloting a Maurice Farman Shorthorn owned by the Carey-Fenton "Joy-riding" Syndicate.

Major Norman Brearley, D.S.O., M.C., A.F.C. (ex-R.A.F.), returned to Australia in July. Before leaving England he purchased two Avro aeroplanes, which were landed in August at Fremantle and were erected near by. The machines were used for passenger carrying and exhibition flights. The first was made on Aug. 2nd, when the Mayor of Perth was taken up.

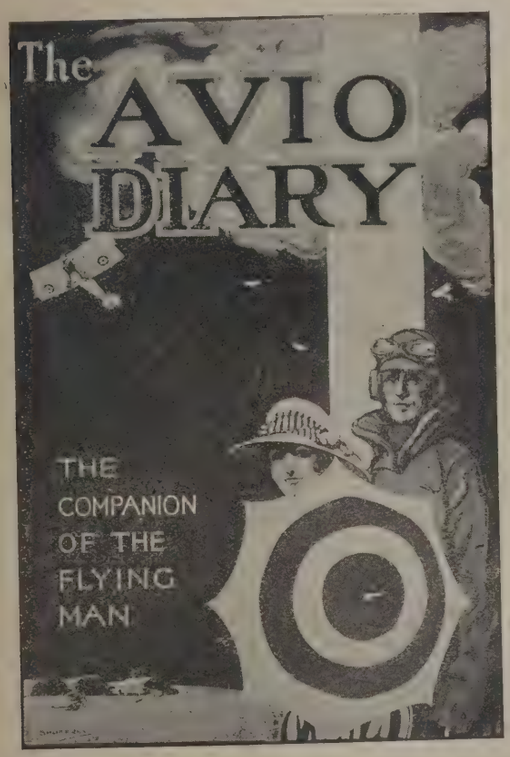
Ten-minute flights over the city of Perth were advertised at a cost of £5 per head, and so keen was the competition that it was decided to sell the first flight by auction. Despite occasional heavy falls of rain, some 4,000 spectators gathered on the Cricket Ground to see the flights on the first day. Many passengers were carried, and exhibition flights were given by Major Brearley.



Send to Serck

for all types of AEROPLANE RADIATORS

Mass production on scientific principles means an unusually high standard of efficiency with a saving of cost far above the average, because of decreased cost of materials and labour. Our output numbers thousands of radiators and we do the whole job, from drawing the tubes to the complete radiator.



We can supply Aeroplane Radiators in any number for replacement or on contract. Write for particulars and terms.

TURNBUCKLES
A
SPECIALITY.

BRIGHT STEEL
BOLTS & NUTS

We shall be pleased to quote for special parts turned from the bar. Send your inquiry direct to us, and it shall have our prompt attention.

A second exhibition of flying was given on Aug. 4th, when leaflets were dropped. Five passengers were taken up on Aug. 7th, and fourteen more on the following day. More flights were made on Aug. 9th and 16th.

Major Brearley proposes to establish a passenger and mail service between Perth and Kalgoorlie. He is also going to teach flying.

Captain H. G. Butler, A.F.C. (ex-R.A.F.), is the agent in Australia for Cellon, Ltd. His first exhibition flight on returning to South Australia was held at Unley Oval on July 23rd, in aid of the Repatriation Fund. His machine was a Bristol monoplane (110-h.p. Le Rhone engine).

On Aug. 6th he flew from Adelaide to his home in Minlaton on the York Peninsular. About a thousand spectators managed to find Conrad's Estate in the Enfield district, from where the flight started, although the locality had not been divulged. His Excellency the Governor (Sir Henry Galway) and the Chief Justice (Sir George Murray) were present.

The machine left the ground at 10.40 p.m. in good weather, with a fresh westerly wind, and carried some 4,000 postcards and many papers. On arrival at Minlaton, he circled round for a while and then landed 60 minutes after he had left Adelaide, 65 miles away. About 35 miles of the journey was over the sea.

On Sept. 16th Capt. Butler gave an aviation display over Port Adelaide, Glenelg and district, dropping Peace Loan messages for the opening of the Peace Loan Campaign.

THE AUSTRALIAN AERO CLUB.

At a general meeting held in Sydney on July 15th a letter was read from the hon. sec. of the club at Melbourne stating that a resolution had been passed that the Melbourne Club in future should be known as the Australian Aero Club, Victoria Section, and that the branch formed in Sydney should be known as the Australian Aero Club, New South Wales Section.

A Central Committee, consisting of the general secretary and two members of each State Committee, will govern all sections of the club. The following were appointed office-bearers :—

General Secretary.—Mr. Hector Sleeman.

Victorian Members.—Major W. J. Sheldon, commanding the Central Flying School, Point Cook; Capt. F. H. McNamara, V.C.

New South Wales Members.—Capt. H. Gilles Watson, D.F.C., and Mr. Edward J. Hart.

The honorary secretary, who is the managing editor of the Australian monthly magazine, "Sea, Land, and Air," said that he would go to Melbourne for the purpose of interviewing Major-Gen J. G. Legge, C.M.G., C.B.

A general meeting of the New South Wales section was held at Sydney on Aug. 18th, Mr. H. C. Macfie presiding.

Mr. Reginald Lloyd, the managing director of Aerial Services, Ltd., detailed his survey from Sydney to Darwin. Major Lee Murray urged that the State Governments should be worried until they ratified the Air Navigation Regulations.

Mr. Hector Sleeman, the managing director of Aerial Transport Ltd., opposed the proposed duty of 20 per cent. on imported aero engines. Capt. P. G. Taylor, M.C. (ex-R.A.F.), described his flight from Melbourne to Sydney.

Mr. V. B. Madden of the Vacuum Oil Company stated that an aviation spirit was to be put on the Australian market very shortly. Mr. W. E. Hart said he had been instrumental, eight years ago, in getting the Customs Duty on imported aircraft removed.

It was resolved that in future the general meeting be held on the third Monday of each month.

THE AUSTRALIAN AIR FORCE.

Regarding the selection of returned officers and men for the Australian Air Force, the undermentioned wing and squadron commanders of the Australian Flying Corps have been invited to form a Selection Committee for the Australian Air Force :—

Lieut.-Col. W. Oswald Watt, O.B.E.; Major W. H. Anderson,, D.F.C.; Major A. H. Jones, M.C., D.F.C.; Major R. S. Brown; Major A. W. L. Ellis, M.C.; Major S. W. Addison; Major R. C. Phillipps, M.C., D.F.C; and Major W. J. Sheldon.

CIVIL FLYING IN CANADA.

Very little civil flying has ever been done in Canada. The majority of the inhabitants of that vast country have never seen an aeroplane. Although regular flying services have been proposed, planned or started in every large civilised country in the world during this year, nothing has been heard of any flying being done on a large scale in Canada by Canadians.

An aeroplane survey was taken of the Labrador forests and yielded very good results. Two American training machines have been taking up passengers for short flights over Vancouver Island. An ex-R.A.F. officer hopes to start pleasure flying to the Thousand Islands next year. The machines entered for the Transatlantic flight congregated at Newfoundland, but that is no credit to Canada; they were only assembled there because it was the nearest point to Great Britain and Ireland.

There is a Canadian Aero Club, so why this terrible stagnation in a country which would be very insulted if called backward, behind the times, regressive? The Canadian Aero Club appears to have done very little, in fact nothing. Of course, it is allied to the Royal Aero Club of this country. Sleeping partners!

It is said that the Canadian Aero Club is greatly influenced by American financial magnates. If so, where are the Yankee "hustle" methods? Or have they taken control merely to block pro-British aeronautical propaganda?

The R.A.F. pilots and observers who have returned to Canada are in proportion to the population of one to every thousand—by far the highest proportion of any country in the world—and yet they can do little with aviation, because there is none. And so they have drifted and are drifting back to commonplace civil life.

At last some of the most distinguished aviators in Canada, being entirely dissatisfied with the Aero Club, have made a move in the right direction.

In Toronto, on Oct. 2nd, some eighty flying-men met together at the Central Y.M.C.A. for a dinner, and decided to form an association to be known as the "Canadian Flying Club."

The following is extracted from the Toronto "Globe" of Oct. 3rd: Among the number present were Lieut.-Col. Barker, V.C., Major A. M. Shook, Major E. G. Joy, and others of the most distinguished aviators in the Canadian or British Service.

The objects of the new association will be to give information on everything connected with flying to returned aviators, to help them keep in touch with civilian flying, and to give the member an opportunity, as far as possible, "to keep his hand in," and thus constitute a national Air Force Reserve. The promoters of the society hope in the near future that they will, as a club, be able to obtain an aerodrome. Machines will be available for the use of the members, many of whom otherwise would not be able to keep in training. The general idea of the founders is that in this way they can best further aviation interests in Canada.

Major Shook presided, and in the course of his remarks the Aero Club came in for sharp criticism for its alleged failure to meet the requirements of the returned fliers.

A committee of sixteen was elected to draw up a constitution.

From the members of the committee Col. Barker was elected president and Capt. A. G. Mackay treasurer.

A SECLUDED LIFE.

The English would hardly think of looking for the most advantageous position for a villa in an impenetrable jujngle "connecting up low land containing water," but apparently Americans like seclusion and find that aeroplanes help them to find inaccessible places in which to build their villas. This explains the following :—

"William Van Alen, of the firm of Severance and Van Alen, New York architects, and Pentz, Van Alen and Durkee, makers of the Pentz airplane compass, while at his office in Palm Beach, this past season, was called upon by a client to select the most advantageous position for the location of a new villa.

"The property, extending from the Ocean to Lake Worth, comprises some twenty acres, and at the present time is practically impenetrable on account of the jungle which runs through it, connecting up some low land containing water, which requires filling in. The contract road bisects the property, and the runways through the jungle not far distant from the property did not afford a sufficient point of advantage to determine the contour of the property, which had to be obtained before Mr. Van Alen could start on the layout of the architectural features.

"His experience recently in connection with certain war work required him to make several flights in airplanes, and in consequence the advantage of using an airplane for the obtaining of this information appealed to him at once. He immediately crossed the lake to West Palm Beach and succeeded in having Mr. Kantner, the pilot at the aerodrome, take him up, and they flew together over the property until Mr. Van Alen had obtained the information he sought."

BURBERRY FLYING KIT

Designed by expert airmen and made in the Burberry material chosen by Sir John Alcock. D.S.C., for his flight across the Atlantic.

Lightweight, self-ventilating, and as flexible as an ordinary wool fabric, this material is as impenetrable as leather, and ensures comforting warmth at all altitudes.

Proofed by Burberry processes, it provides an effective safeguard against rain and all damp, without the aid of rubber oiled-silk, or other air-tight agent.

Complete R.A.F. Kit in 2 to 4 Days, or Ready for Service.

Illustrated Catalogue & Patterns Post Free.

Burberry Carapace Air-Suit

The Tielocken

Doubly covers every vulnerable part of the body, and is lined throughout with lightweight fleece. Fastens with a strap-and-buckle instead of buttons.

Burberry Carapace Air-Suit

The outrig worn by Sir John Alcock and Sir Whitten Brown on their Trans-atlantic flight. A thoroughly practical one-piece overall suit that protects the airman from head to heel.

Every Burberry Garment is labelled "Burberrys."

AVIATION IN EGYPT.

FROM THE "EGYPTIAN MAIL,"

In may parts of the Empire where the climatic conditions are suitable, it is possible to introduce services that could operate successfully and regularly as soon as the machines and the ground organisation are available. It would seem advisable from an aeroplane point of view to develop services over land routes, leaving long-distance trans-ocean traffic to the rigid airship. While it is impossible for a Government to develop a long-distance service as, for example, to Australia, it is practically outside the region of possibilities for a private firm to undertake at present a service of this nature as a profitable venture.

THE INITIAL COST.

The cost of transit of the necessary oil, petrol, consumable stores, spare parts, and the provision of sheds, aerodromes, machinery and mechanics at the necessary intervals would be a costly work. If, however, Egypt, India, and Australia developed commercial aviation within their own borders on such a scale that aeronautical supplies could be largely dealt in as articles of commerce in those countries, then the maintenance of the stations between those countries becomes much more simple and less costly and brings it within the range of possibility for private enterprise to operate an air service.

It would therefore seem that we should help, by all the means in our power at the present time, the local development of commercial aeroplanes in these overseas countries. Very many war-type machines, with slight modification, are suitable for this pioneer work. While this local work is proceeding we can push on with the construction of types that will be suitable to link up these great Dependencies with practically regular air services.

THE FLIGHT HABIT.

Our aim should be to make it easy for people in those overseas countries to acquire the "flight habit." It is this "flight habit" that will create the demand for local flying, and that demand will soon grow into a call for longer distance services as the public realise the speed and time saving possibilities of air travel. Both India and Egypt offer very wide possibilities for aeronautical development, the East is particularly suitable for flying from a climate point of view, and the existing land and sea communications both internally and externally leave much to be desired. An investigation into railway time-table speeds show how great would be the saving of time which the aeroplane could achieve for urgent needs.

The Governments of these countries could greatly assist matters by seriously tackling the transportation of mails by air. This action would be of immense value in speeding-up aerial development in these countries and focus the attention of business men on the future possibilities of the air. During the recent disturbances in Egypt seaplanes constructed for war service were successfully used daily for three or four weeks over distances of 100 or more miles to maintain communications when the existing railway and telephone services had been broken. The machines operated successfully throughout the periods of distress, running regularly to scheduled time, proving the inestimable value of air communications; and the Egyptian and Indian Governments would be well advised to take in hand seriously the movement by air of fast mail matter.

In England the growth of the flight habit has already commenced. During the recent spell of fine weather flying has taken place daily without intermission for three weeks at Blackpool and Southport, over a thousand flights per week being given, and a steady demand for long-distance flights was immediately noted. A Manchester-Blackpool service has been running twice daily, despite heavy mists at Manchester on several occasions.

AERIAL MAIL SERVICE.

As an indication of the possibilities of using aeroplanes for mail-carrying, it is reported that the two war squadrons operating the Air Ministry mail service between Folkestone and Cologne, a distance of about three hundred miles, carried between March 1st and April 26th last more than 1,600 bags of mails. During that time the weather on ten days was too bad for flying, the inclement conditions during March being exceptional even for England. During the remaining 47 days of the period, these squadrons made 289 flights, regularity of service that is of great credit to the Air Ministry and the squadrons concerned. One may add that the service is continual and regular during the spells of favourable weather now being experienced. With such suitable climatic conditions existing in many of our overseas Dominions, and given a similar excellent organisation as effected by the Air Ministry in this Folkestone-Cologne service, regular mail services could be instituted in these overseas countries.

GOVERNMENT AID.

The Government hold vast stocks of aeroplanes that could readily be made suitable for this work, and it was suggested that on the declaration of peace, the Government would be well advised to dispose of their surplus machines, in addition to those already promised as gifts, at a nominal figure for home services, and for those great Dependencies who provided the Mother Country with such excellent fighting men. There are some hundreds of thoroughly trained and efficient overseas air pilots, who would be magnificent material to man these air mail services.

It is understood that the Air Ministry are organising an air service between Cairo and Karachi. This is probably the most difficult part of the England-to-Australia route to organise from the ground and supply point of view, and the Ministry are to be congratulated in attacking the hardest part of the problem. It must be remembered, however, that the amount voted by Parliament for civil aviation is not considerable, and in view of the national financial position the Ministry will, of necessity, be very greatly reduced in comparison with its size and activities in the past. It can, however, by disposing of its surplus machines in the direction indicated, at a nominal figure, make it possible for the "flight habit" to be acquired by people who will, by reason of their knowledge of air flying, create a demand that will enable private enterprise to provide the long-distance services. With the exception of a few obsolete single-seater types, suitable for fighting only, it should not be necessary for the Government to break up any machines.

TO FLYING-BOAT ENTHUSIATS.

Those who are at all interested in flying-boats, and especially those who have served with the big-boat squadrons on the East Coast, will probably be glad to know that an extraordinarily fine autotype engraving has been published of Mr. C. E. Turner's Academy picture, "The Channel Patrol: An F.2 Flying-Boat Taking Off."

The drawing of the boat is almost photographic in its accuracy. The picture is full of life and gives one a splendid impression of one of these huge boats crashing through the tops of the waves just before leaving the water.

The reproduction is splendidly done and the print—which measures 15 in. by 8½ in. without the mount—is in itself a work of art. The prints are published at one guinea each by the Autotype Fine Art Co., Ltd., 74, New Oxford Street, W.C.

AIRCRAFT IN PARLIAMENT

Dec 18th—The following written answer was given :—

KENLEY AERODROME.

Sir STUART COATS asked the Under Secretary of State to the Air Ministry whether, in view of the danger to aviators landing at the Kenley Aerodrome on account of its exceptional altitude and liability to be enveloped in clouds and fog, as instanced by the recent fatal accident near Caterham, and also in view of the annoyance caused to the residents of the district by the noise of arriving and departing aeroplanes, he will consider the permanent abandonment of the site and the restoration of the common, so far as may be possible, to its original condition?

Mr. CHURCHILL: The situation of this aerodrome, on which a large amount of money has been spent, renders it of great importance in connection with the Air Defences of London, and it is considered desirable that it should, therefore, be retained as a permanent station by the Royal Air Force. The advantages and disadvantages of the prevailing atmospheric conditions at Kenley were fully considered at the time when this decision was taken.

* * *

Dec. 22nd :—The following oral answers were given :—

AIRSHIPS (COMMERCIAL PURPOSES).

Major Sir B. FALLE asked the Prime Minister if he was aware that the R.34 and R.39, the two latest rigid airships, are to be sold for commercial purposes; and if he will allow one of them to be retained for the use of the Indian Government on the North-West Frontier of India.

Mr. BONAR LAW: The answer to the first part of the question is in the negative. I am making inquiries in regard to the suggestion in the last part of the question.

DOUGLAS-PENNANT INQUIRY.

Sir J. BUTCHER asked the Prime Minister whether he would reconsider the present system under which the House of Lords were able to appoint Committees of Inquiry against the wishes of the Government and of the House of Commons, as in the Douglas-Pennant case, and thereby to incur large expenditure and throw heavy burdens on the public purse.

Mr. BONAR LAW: As I stated on Dec. 10th last this raises a very big constitutional question, and I do not think it is possible to deal with it by question and answer.

* * *

Dec. 23rd :—

AIR ESTIMATES.

Before the adjournment of the House Major Glynn asked a question of the Leader of the House in view of the importance of a reply which he received from the Secretary of State for War.

The question was :—"To ask the Secretary of State for War whether the memorandum by the Chief of the Air Staff issued with the Air Estimates had received detailed consideration by and the approval of the Board of Admiralty and the Army Council; and whether it is intended to supplement the Chief of the Air Staff's memorandum with any comments passed on it by the Admiralty and the War Office in so far as those Departments are affected by the proposals contained in it."

The reply was :—"No, Sir, it was stated in the memoranda that the organisation proposed was provisional. I was anxious that it should be published in order that the House might be informed at the earliest possible moment of the general outline of the proposed permanent organisation of the Royal Air Force. Discussions are now proceeding between the Departments concerned. The financial limits of the scheme must be taken as definitely settled by the Cabinet."

Major GLYNN said that that reply showed that there was no co-ordination between the technical heads of the Air Ministry, the War Office, and the Admiralty, and asked if the terms of the memorandum by the Chief of the Air Staff would remain the policy of the Government, or if fresh proposals would be considered by the Committee of Imperial Defence or the recognised experts of the Navy and Army before they were presented to the House as the settled policy of the Government.

Mr. BONAR LAW said he could not give an answer to the question without notice. The Cabinet approved of the Trenchard scheme on general grounds. The formation of a Joint Imperial Staff is receiving the attention of the Cabinet.

* * *

The following written answers were given :—

DISORDER AT HENLOW.

Mr. W. THORNE asked the Secretary of State for War if he was aware that on Sunday night, Nov 2nd last, there was an outbreak of disorder among the Royal Air Force men at Henlow station; that whilst the disturbance was being dealt with by the non-commissioned officers a number of men concerned entered hut No. 21 whilst the proper occupants were in bed and asleep; that following the occurrence a number of the latter were picked out and charged with inciting to mutiny and other counts, and without their defence being considered were sentenced to detention at Wandsworth and loss of grade; that such punishment has caused indignation and discontent; and if he will order an inquiry into the matter with a view to justice being done to innocent men?

Captain GUEST: The answer to the first part of the hon. gentleman's question is in the affirmative; to the second part, that the men who caused the disorder were rounded up in hut No. 21; to the third part, that these men were brought before the commanding officer, and that none of them were dealt with without their defence being considered. Four men were tried by general court martial, 11 elected to be tried by district court martial and have already been brought to trial, and the remainder were dealt with summarily. I am not aware that indignation and discontent has been caused by the way in which this outbreak has been dealt with. If the hon. Member has any reason to believe some or any of the men who were in bed and asleep have been punished unjustly and will furnish me with the names, I will have *that* matter inquired into.

AEROPLANE DURABILITY.

Mr. MURCHISON asked the Secretary of State for War whether he can state the average life in flying hours under peace conditions of two-engined aeroplanes capable of carrying 20 to 30 passengers and single-engined aeroplanes carrying up to four passengers?

Captain GUEST: The period that has elapsed since civil flying under peace conditions commenced has been insufficient to allow such reliable data to be obtained as would enable a useful answer to be given to this question. The necessary data are being collected. It may, however, be observed in this connection that if the proper replacements, both of engine and aeroplane parts, are made during the periodical overhauls, there is no reason why any aeroplane should ever wear out, as after 200 hours' flying there will probably be very little of the original machine left.

OFFICERS (RANK).

Viscount WOLMER asked the Under Secretary of State to the Air Ministry whether officers of the Royal Air Force promoted to the substantive rank of major for distinguished service rendered in the war by His Majesty in the New Year Honour List have been now instructed to vacate their position in the Royal Air Force as majors, to relinquish this rank, and to report back to their old unit.

Major TRYON: Promotion in the Royal Air Force is given in respect of an officer's Royal Air Force commission and is not Army rank. The number of Air Force officers has been reduced from, approximately, 30,000 at the date of the Armistice, to about 4,000 at the present date, and consequently a large number of officers seconded to the Air Force from the Army have been returned to their units. Promotions in the Royal Air Force conferred as rewards for good service in the Air Force on officers seconded from the Army must necessarily become inoperative during the subsequent service of these officers in the Army unless they have attained equivalent rank in their parent service. The question of allowing officers, who have not then attained Army rank equivalent to their Royal Air Force rank, when they finally leave the Army to reassume their Royal Air Force rank will again be considered.

A NOVEL OF THE AIR.

OVER AND ABOVE. By J. E. Gurdon. London: Wm. Collins, Sons, and Co., Ltd. Pp. vi + 250. Price 7s. 6d.

There are some books which, while not in themselves masterpieces, bear in them the true impress of life. Each incident is related with an intimacy which seems as though it could only have been acquired by personal experience. Few of the many hundreds of war books published in the past five years have any trace of this quality or indicate with any degree of truth the mental altitude of those who had to take an active part in the recent hostilities.

"Over and Above" has this quality of truth. It is not possible to discover whether the author has himself any personal experience of the incidents he describes, but it is hard to realise how he could have written in so convincing a manner unless he had served with a flying unit.

The book describes the life of a pilot from the days of preliminary training, through the usual experiences of bombing and fighting, to the days when, having received promotion and due honours, he returns to England for other duties. The characterisation is excellent, and it is possible that the squadron whose deeds are told might be recognised by those who have a catholic knowledge of personalities in the R.F.C. and R.A.F.

The weariness of life in "Dud Weather" is well described, and there is a vivid realism in the description of an aerial fight in the chapter on the "First Hun."

The book is uniform in construction, and it is not possible to select *purpuriae panni* without doing an injustice to the rest of the work. It does not achieve greatness, but it is well above the average of war novels.

A NEW FRENCH ENTERPRISE.

The administrative and editorial departments of the new French monthly aeronautical review, "L'Air," has recently been removed to 5, Rue de l'Isly, Paris. The telephone number of the paper is Louvre 4756.

"L'Air" is striking out an entirely new line in French journalism. It has long been the lamentable custom of French papers to demand payment for editorial notices, with the result that, even in such important matters as show reports, firms which do not pay for the editorial notices of their products are either left unnoticed or, if so important that they cannot be ignored, are given only very insignificant space. "L'Air" has adopted the method prevailing among all reputable British papers in that it reviews the products of manufacturers and the doings of their products quite impartially, irrespective of whether the firms advertise or not, and under no circumstances does it ask or receive payment for matter contained in its editorial columns.

Under the presidency of M. Laurent Eynac, Parliamentary Deputy, Vice-President of the Parliamentary Aviation Group, and under the technical direction of M. Roche d'Estrez, "L'Air," is rapidly taking a foremost place among French technical journals, and its new method of doing business is bound to win it the respect and appreciation of all concerned with the French Aircraft Industry.

THE DAILY DRUDGERY OF PLEASURE.

A correspondent in Bradford writes :—

The Berkshire Aviation Company performed here during the week ending Nov. 23rd on Avros. They flitted very pleasantly over the works on several occasions and on each occasion a number of hard-worked sons of toil might have been observed gazing Heavenwards with a vacant expression, having apparently left their dearly loved work for the express purpose. However, anything which takes their minds away from the daily drudgery of backing horses and running up the cost of living is probably for their mental good.

WAR OFFICE, Dec. 23rd.

REGULAR FORCES.—R.A.S.C.—Temp. Capt. H. F. Melville, R.A.F., to be temp. Lt., Sept. 25th.

AIR FORCE.

AIR MINISTRY, Dec. 19th.

R.A.F.—The following officers have been granted short service commns. in the ranks stated, with effect from Dec. 19th. They will retain their seny. in the substantive rank last held by them prior to the grant of the short service commn.

In the case of officers now gazetted Flying Officer or Observer Officer from Pilot Officer, seny. will date from the date of "Gazette":—

Flight Lt.—F. J. Watts (A.).

Flying Officers.—J. L. Bernard (A.), E. J. A. Burke (A.), R. J. Copley (T.), J. S. Griffith, D.F.C. (A.), H. L. P. Lester (A.), H. E. Ranson (A.), C. B. Waters (A.).

Observer Officers.—D. Craik, J. E. Truss.

Flying Officers (from Pilot Officers).—R. B. Dormor (T.), H. J. Gye (A.), S. J. Mason (A.), C. McC. Vincent (A.), S. N. Webster (A.), L. Whitfield (A.).

Observer Officers (from Pilot Officers).—E. Cuthbert, S. P. B de Moyse-Bucknall, M. St. J. Ross, J. S. F. Watson.

The notifications appearing in the London "Gazettes" of the dates indicated below, appointing the following officers to short service commissions, are cancelled:—Flying Officer J. M. Russell (Ad.); Flying Officer R. L. G. Wright (A.), Sept. 12th; Flying Officer S. S. Flook, D.F.C. (A.); Flying Officer G. A. Morgan, A.F.C. (A.); Flying Officer I. C. R. Mackenzie (A.); Flying Officer F. J. W. Mellersh, A.F.C. (A.); Flying Officer G. A. Morgan, A.F.C. (A.), Oct. 24th; Flight Lt. F. J. Powell, M.C. (A.); Flying Officer J. L. Montgomery (A.), Dec. 12th.

R.A.F.—The classification of Maj. W. J. Shields is "(T.)" and not "(Ad.)" as stated in the "Gazette" of Aug. 1st.

The notification in the "Gazette" of Aug. 1st appointing the following officers to permanent commns. is cancelled:—Maj. R. H. Howell (S.O.), Capt. W. B. Lawson (A. and S.), Lt. C. M. Eastley (A.).

The notification in the "Gazette" of Aug. 22nd appointing Capt. A. S. C. MacLaren, M.C., A.F.C. (A.), to a permanent commn. is cancelled.

The notification in the "Gazette" of Oct. 28th appointing Flying Officer I. H. P. McEwen (A.) to a permanent commn. is cancelled

The following temp. appointment is made:—

Staff Officer, 3rd Class.—(Q.) Flight Lt. T. G. Gordon, M.B.E., Dec. 12th.

FLYING BRANCH.—Sec. Lt. L. Harrison to be Lt., May 27th.

The following Cadets are granted temp. commns. as Sec. Lts. (O.):—175646 E. N. Howes, 176063 H. A. Thompson, Aug. 26th, 1918; 144746 J. C. Cook, 9438 T. S. Duncanson, 176676 L. W. Jones, 176685 P. H. Lewis, 177075 F. Silver, Sept. 9th, 1918.

The following relinquish their temp. R.A.F. commns. on return to Army duty:—Flying Officer K. A. Seth-Smith (Lt., Northd. Fus.), Nov. 17th; Pilot Officer (Hon. Flying Officer) E. M. Harris (Lt., R.F.A.), Dec. 1st; Flying Officer D. Hodson (Lt., 116th Mahrattas), Dec. 11th.

Sec. Lt. E. H. Fry relinquishes his commn. on ceasing to be empld., and is permitted to retain his rank, July 4th.

Lt. H. F. Nicholls, D.F.C., relinquishes his commn. on ceasing to be empld., Sept. 7th.

Transferred to unempld. list:—Sec. Lt. N. Abram, Jan. 6th (substituted for notification in "Gazette," Jan. 24th, wherein this officer's name was described as Abrams); Lt. J. O. Barclay, Jan. 8th (substituted for notification in "Gazette," Jan. 21st, wherein initials of this officer were described as J. B.); Sec. Lt. J. C. Cook, Jan. 21st; Lt. A. B. Paton, Jan. 25th; Lt. E. Wilson, Jan. 28th; Sec. Lt. V. H. Mayers, Sec. Lt. D. M. Rohrer, Sec. Lt. H. M. Ross, Feb. 1st; Sec. Lt. E. N. Howes, Feb. 5th; Sec. Lt. R. G. Sparey, Feb. 15th; Sec. Lt. A. Taylor, Feb. 16th; Sec. Lt. L. W. Jones, March 8th; Lt. B. H. Garrett, March 24th; Lt. F. G. Solis, Capt. A. Y. Wilks, March 15th; Sec. Lt. F. Silver, March 16th; Lt. R. Sykes, March 17th (substituted for notification in "Gazette," Nov. 7th); Lt. W. N. Fox, March 20th; Capt. F. C. Henderson, April 1st; Sec. Lt. P. H. Lewis, April 8th; Lt. H. A. Hewitt, April 10th; Lt. C. L. Hilborn, April 25th; Lt. M. B. Watson, May 1st; Sec. Lt. H. A. Thompson, May 6th; Sec. Lt. L. J. Murray, May 8th; Sec. Lt. J. H. Parry, May 13th; Sec. Lt. T. S. PERSONAL NOTICES.

NAVAL.

MARRIAGE.

SMYTH-PIGOTT—FEILDING.—The marriage took place on Dec. 22nd (instead of Dec. 30th, as previously arranged), at Newnham Paddox, Lutterworth, of Wing Comdr. R. Smyth-Pigott, D.S.O., R.A.F. (late R.N.A.S.), and Lady Clare Feilding. Owing to the recent death of the Countess of Denbigh, the bride's mother, the ceremony was very quiet, only immediate relatives of the bride being present. Father van Dillen officiated.

MILITARY.

DEATH.

EVERSDEN.—Capt. Robert E. Eversden, R.A.F., who was killed in the aerodrome at Ekaterinodar, South Russia, on Aug. 15th, was 24 years of age. Capt. Eversden, with one or two other English officers, were living in a railway carriage, but slept in a tent at some distance away. About midnight Capt. Eversden left the tent to get something out of his kit when he was shot dead by a sentinel. A report of the official inquiry into the circumstances of his death has been promised by Mr. Churchill.

Capt. Eversden, after serving in the Yeomanry and in the 19th Hussars, received a commission in the Suffolk Yeomanry and went to Gallipoli in September, 1915. After Gallipoli he served in German East Africa and was seconded for the R.F.C. in Egypt in November, 1918. From Egypt, where he was an instructor in aviation at Aboukir, he served in Palestine and did remarkable work in Allenby's campaign. He was made captain in the Suffolk Yeomany in June, 1916, and in the R.A.F. in April, 1917.

BIRTH.

RYDON.—On Dec. 21st, at Sandgate, Queensland, the wife of Capt. H. E. Rydon, R.A.F., of a son.

AIR FORCE.

DEATH.

BRADLEY.—Lieut. Stanley Blackall Bradley, late R.A.F., who died, aged 32, as a result of the aeroplane accident at Caterham on Dec. 11th, was privately educated at Cranleigh, subsequently training for four years in the Crewe Works of the L.N.W. Railway Co. He then entered Caius College, Cambridge, where he remained three years and read engineering. On leaving the University in 1913, he joined the Engineering Works of Craddocks, Wakefield, subsequently passing on to the house in India. He joined No. 110 Squadron, T.F., R.A.F., during the latter part of the war. When the war came to an end Mr. Bradley joined the staff of the Aircraft Travel and Transport Company. On the firm's behalf he visited Brazil, and on his return became one of the pilots on the London—Paris Service

Mr. Bradley was the fourth son of Rev. Walter Bradley, late Vicar of Birchfield, Birmingham.

MARRIAGES.

BELLORD—CARDEW.—The marriage of Captain Cuthbert G. Bellord, late R.A.F., eldest son of Mr. E. J. Bellord, and Margaret Isabel, elder daughter of Sir Alexander Cardew,

K.C.S.I., and Lady Cardew, C.B.E., took place quietly on Dec. 9th at St. James's Church, Spanish Place.

MACNAB—RADCLIFFE.—On Dec. 12th, at St. Margaret's, Westminster, Capt. J. Alexander Macnab, R.A.F., only son of the late J. A. Macnab and Mrs. Macnab, of Harrogate, was married to Irene Marguerite Campbell, only daughter of Commander C. A. Radcliffe, R.N., and Mrs. Radcliffe by the Rev. C. Whincup, of Heaton, uncle of the bridegroom.

MARSHALL—MITCHELL.—On Dec. 23rd, at the Church of St. Mary, Beddington, Surrey, Capt. Gerald S. Marshall, O.B.E., R.A.F. (Med.), was married to Kathleen Mitchell, late Deputy Administrator, W.R.A.F.

SOUTHALL—TOMPKINS.—On Dec. 22nd, at St. Edburg's Church, Bicester, Mr. A. W. Southall, R.A.F., son of Mr. and Mrs. Southall, of Bridge Gate, Retford, was married to Marjorie Mary, only daughter of the late Mr. W. Tompkins and Mrs. Tompkins, of Bicester.

ENGAGEMENTS.

DUTSON—HUDLESTON.—The engagement is announced between Jack Dutson (late Captain, R.A.F.), only son of Mr. and Mrs. William Dutson, of Bristol, to Dorothy, younger daughter of Mr. and Mrs. R. J. Hudleston, of Portishead.

JAMES—SADDINGTON.—The engagement is announced of Lieut. D. Brodie James (late R.A.F.), younger and only surviving son of Mr. and Mrs. A. F. Brodie James, of Kensington, W., and Miss Margaret Saddington, only daughter of Mr. and Mrs. H. Saddington, 15, Brunswick Square, Hove.

WAGHORN—SINGLETON-WISE.—The engagement is announced between Capt. Hugh Colin Waghorn, O.B.E., R.A.F., only son of Hugh Waghorn, of Wandsworth Common, S.W., and Miss Marjorie Agnes Janet Singleton-Wise eldest daughter of Ernest Singleton-Wise, of Bexhill, and Deepcove, British Columbia.

BIRTHS.

HAMERSLEY.—On Dec. 25th, at 62, Portsmouth Road, Woolston, Clarice (née Lees), the wife of Capt. H. A. Hamersley, M.C., late A.I.F. and R.A.F., of a son.

POWER.—On Dec. 8th, at Whoberley, Wendover, Bucks, the wife of Captain D'Arcy Power, R.A.F. Med. Ser., of a daughter.

PRESTON.—On Dec. 21st, at Cairo, the wife of Lieut. R. Chevallier Preston, R.A.F., of a son.

QUICK.—On Wednesday, Dec. 17th, at Torquay, the wife of Capt. J. T. Quick, late R.A.F.—of a daughter.

RABAGLIATI.—On Dec. 8th, at Velindre, Woburn Sands, Bucks, the wife of H. Victor Rabagliati, barrister-at-law, late Captain R.A.F., of a son.

TOMKINSON.—On Dec. 20th, at The Glen, Brook Lane, Felixstowe, to the wife of Squadron Leader Lancelot Tomkinson, A.F.C., R.A.F.—a daughter.

ROYAL AERO CLUB NOTICES.

DISTANCE IN A GIVEN TIME: CLOSED CIRCUIT.

Aviator and One Passenger.

Time.	Distance.	K.P.H.	M.P.H.
¼ hr.	57.29 kil. (35.60 miles)	229.16	142.40
½ hr.	115.60 kil. (71.83 miles)	231.20	143.66

SPEED: CLOSED CIRCUIT WITHOUT ALIGHTING.

Aviator and One Passenger

Distance.	Time.	K.P.H.	M.P.H.
50 kil.	13 min. 7 sec.	228.72	142.12
100 kil.	26 min. 1 sec.	230.62	143.30
150 kil.	38 min. 47 sec.	232.05	144.19

GREAT BRITAIN-AUSTRALIA FLIGHT.—The following cablegram to the Prime Minister of Australia was confirmed:—

Subject to verification of machine, Capt. Ross Smith has fulfilled the conditions laid down by Australian Government for £10,000 prize for flight from Great Britain to Australia. The Royal Aero Club, under whose competition rules and auspices the flight was made, will award prizes to Captain Ross Smith Royal Aero Club tenders its heartiest congratulations to the Prime Minister and all Australians on the successful accomplishment of this epoch-making flight.

The following message from Rear-Admiral H. S. Knapp, United States Navy, dated Dec. 11th, 1919, was read:—

Permit me to congratulate you upon the successful completion of the England to Australia flight. The indomitable pluck and perseverance of Captain Smith and his crew is typical of the spirit of British airmen, and their accomplishment adds another glorious page to the history of aviation achievements.

"DAILY EXPRESS" £10,000 PRIZE.—The regulations for this prize were approved.

FACILITIES FOR TOURING.—Group Captain C. R. Samson, C.M.G., D.S.O., R.A.F., and Lieut.-Colonel Spenser D. A. Grey, D.S.O., were appointed a Sub-Committee to consider what steps the Club should take regarding the publication of aerial routes and maps for touring.

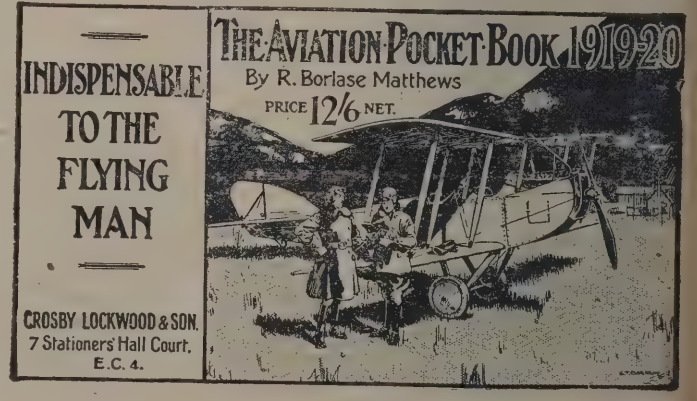
ACROSS AUSTRALIA.



It is now known that the machine used by Capt. Wrigley on his flight from Melbourne to Port Darwin, which was reported recently, was a B.E.2e biplane. 90 h.p. R.A.F. engine, built by the British and Colonial Aeroplane Company, Ltd., in 1915.

THE BANGKOK AERODROME.

Capt. Ross Smith stated, with regard to his flight to Australia, that the first real aerodrome he encountered after leaving London was that outside Bangkok. This aerodrome was designed and erected by Barrow Brown and Co., Ltd., of Bangkok, with material supplied through their London agents, John Birch and Co., Ltd., 2, London Wall Buildings, E.C. The structural steel work was by E. Wood and Co., of Manchester.

LUBRICATION ON THE AUSTRALIAN FLIGHT.

Messrs. C. C. Wakefield and Co. had supplies of Castrol "R" at every stopping place on the route to Australia, and Captain Ross Smith was thus enabled to replenish without delay. Wakefield's have every reason to feel proud of their association with the latest and greatest feat in aviation.

The Australian Flight

Another Great Triumph for

THE SMITH AVIATION INSTRUMENTS AND THE FAMOUS K.L.G. PLUGS

The Vickers-Vimy-Rolls Machine (piloted by Capt. Ross Smith, M.C., D.C.M., A.F.C.), which has just achieved the remarkable success of flying from Great Britain to Australia (10,000 miles in 28 days), was fully equipped with the following Smith Instruments and Accessories :—

Revolution Indicators **Cambridge Radiator Thermometers**
Airspeed Indicators **Husun Compasses No. 253**
and the famous K.L.G. Plugs.

It is also worthy of note that EVERY competitor in the Australian Competition—Capt. Matthews (Sopwith); Lieut. Douglas (Alliance); Capt. Wilkins (Blackburn Kangaroo); and Lieut. Howell (Martinsyde)—carried Smith Instruments and Accessories. Proving once again that for serviceability, accuracy and reliability the Smith Aviation Instruments and the K.L.G. Plugs have no equal.

Write for Catalogues of the Smith Aviation Instruments and K.L.G. Plugs to:—

London-Paris
Air Express

Mails—Parcels—Passengers

DAILY TIME TABLE.

HOUNSLOW (depart)... 12.30 p.m.
LE BOURGET (arrive) 2.45 p.m.

LE BOURGET (depart) 12.30 p.m.
HOUNSLOW (arrive)... 2.45 p.m.

Mails

By arrangement with the British and French Post Offices an express air-mail is now carried daily on this route. The fee is 2s. 6d. an ounce, over and above the usual rates of postage, and letters which are handed in during the morning in London, up to the times indicated, and at the Post Offices specified below, will be delivered in Paris by about 4 p.m. the same afternoon.

G.P.O., King Edward's Buildings, 11 a.m.; Threadneedle Street, 10.45 a.m.; Lombard Street, 10.45 a.m.; Parliament Street, 10.45 a.m.; Charing Cross 10.50 a.m.; W.C. District Office, 11.10 a.m.; W. District, 11.15 a.m.; S.W. District Office, 10.40 a.m.

Passengers

The passenger fares are as follows:—Single, £21; return, £42. This fare includes free conveyance by motor-car to Hounslow Aerodrome from any point within a mile of Piccadilly Circus, and also conveyance by motor from Le Bourget into Paris. Similar arrangements exist as to the journey from Paris to London. A passenger, called for at an hotel in London at 11 a.m., arrives at the door of his hotel in Paris by 4 p.m. the same afternoon.

Parcels

The rate for parcels is 5s. 1b., but in the case of parcels weighing more than 2 lbs., or for regular consignments, much lower rates can be quoted If handed in up to 10 a.m. at the agents specified below, parcels will reach Paris the same afternoon; whereas by land and sea, even if a special "Grand Vitesse" fee is paid, a parcel is several days, and perhaps a week, in reaching its destination.

Full particulars regarding freights can be obtained from Aircraft Transport and Travel, Ltd., 25-27, Old Queen Street, S.W.1., or from the American Express Co., Queen Street and Haymarket; Thos. Cook & Son, Ludgate Circus, E.C., and 38-39, Piccadilly, W.; General Transport, Ltd., 52, Crutched Friars; J. Jackson & Sons, 7-8, Charing Cross, and King William Street, E.C.; Henry Johnson & Sons, 18, Byward Street, and Beak Street, W.; Carter Paterson & Co., 6, Maddox Street, W., and 3, Cannon Street, E.C.; Lep Aerial Travel, Piccadilly Circus (Criterion Corner); and Hernu, Peron & Co., 98-100, Queen Victoria Street, E.C.

NOTE.—Parcels are received up to 10.30 a.m. at the two depots mentioned above of the American Express Company; or up to as late as 11.30 a.m. at the Hounslow Aerodrome.

THE GRAHAME-WHITE—ROLLS-ROYCE AERO LIMOUSINE.

THIS machine, which can be seen in flight at the London Aerodrome, Hendon, has been designed specially for pleasure and commerce. It is not an adapted War machine, but is a specially constructed Limousine, fitted with two Rolls-Royce engines, luxuriously upholstered, and containing an electrically heated carpet. There is ample accommodation for 4 passengers. The pilot, with whom communication is maintained by speaking-tube, sits in a separate compartment above, and at the rear of, the passengers' quarters.

There is also the Grahame White—Rolls-Royce Aero Limousine (9 seater), which is of the same construction as the 5-seater, with slight variations. The front cabin has been enlarged to take 6 passengers and the pilot. Moved farther back, between the pilot and planes, a special cabin has been placed to afford comfortable accommodation for 2 additional passengers or luggage.

For those requiring a sporting machine there is the Grahame-White Bantam Single-seater, fitted with 80 h.p. Le Rhone Engine. Speed 100 miles per hour.

Illustrated catalogues and further information regarding the above and other types of machines may be obtained upon application to:

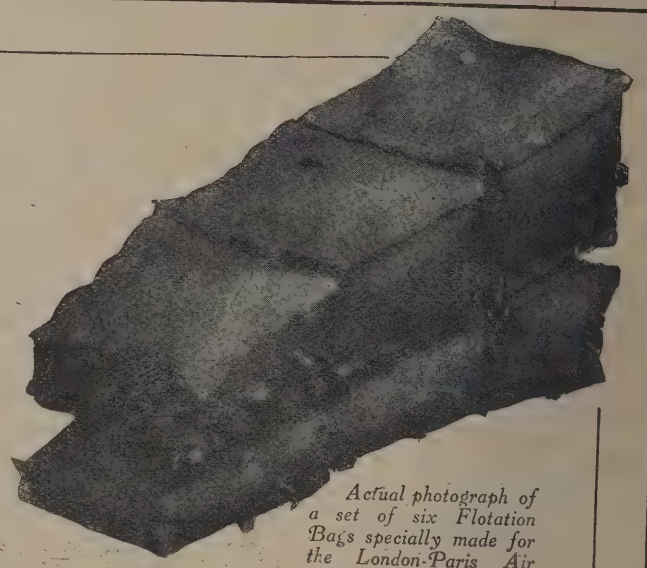
SPEED WITH SAFETY

ACCLES & POLLOCK, LIMITED.

REPUTATION.

As manufacturers of weldless steel tubing, as tube manipulators, and as steel press-workers, we have a world-wide reputation for all-round excellence. Multitudinous are our products, and our reputation is behind every item.

We are right in the forefront with our "Apollo" tubular box spanners. They are becoming increasingly popular in progressive engineering workshops. We make several patterns including a special set for Ford Cars—all of which leave absolutely nothing to be desired in tubular spanner construction. Ask for our Spanner catalogue and price list. We can supply aircraft parts in big quantities, as in this connection we are specialists in tapering, bending, trapping, welding, and all other classes of tube manipulation and presswork.



To-day we recognise that aircraft builders have more time to manipulate their own components, but they need steel tubing, and we supply the very best. Further, let our war experience assist you in this matter of steel tubing and steel presswork. We may be able to save you money, because we have the tools for many components.

Aeroplane Flotation Bags

The latest and most successful device for sustaining an Aeroplane when a forced descent has to be made upon the water. These bags, which are guaranteed absolutely air and water tight, are specially shaped to fit compactly into the framework of the fusilage. They are indispensable where flying is undertaken continuously over the sea, or other large stretches of water.

Actual photograph of a set of six Flotation Bags specially made for the London-Paris Air Service.
